The living being dies, because it is a contradiction. Implicitly it is the universal or Kind, and yet immediately it exists as an individual only. Death shows the Kind to be the power that rules the immediate individual. For the animal the process of Kind is the highest point of its vitality. But the animal never gets so far in its Kind as to have a being of its own; it succumbs to the power of Kind. In the process of Kind the immediate living being mediates itself with itself, and thus rises above its immediacy, only however to sink back into it again. Life thus runs away, in the first instance, only into the false infinity of the progress *ad infinitum*. The real result, however, of the process of life, in the point of its notion, is to merge and overcome that immediacy with which the idea, in the shape of life, is still beset.

§ 222

In this manner however the idea of life has thrown off not some one particular and immediate 'This', but this first immediacy as a whole. It thus comes to itself, to its truth: it enters upon existence as a free Kind self-subsistent. The death of merely immediate and individual vitality is the 'procession' of spirit.

(b) Cognition in general

§ 223

The idea exists free for itself, in so far as it has universality for the medium of its existence — as objectivity itself has notional being — as the idea is its own object. Its subjectivity, thus universalised, is pure self-contained

distinguishing of the idea-intuition which keeps itself in this identical universality. But, as *specific* distinguishing, it is the further judgment of repelling itself as a totality from itself, and thus, in the first place, presupposing itself as an external universe. There are two judgments, which though implicitly identical are not yet explicitly put as identical.

§ 224

The relation of these two ideas, which implicitly and as life are identical, is thus one of correlation: and it is that correlativity which constitutes the characteristic of finitude in this sphere. It is the relationship of reflection, seeing that the distinguishing of the idea in its own self is only the first judgment — presupposing the other and not yet supposing itself to constitute it. And thus for the subjective idea the objective is the immediate world found ready to hand, or the idea as life is in the phenomenon of individual existence. At the same time, in so far as this judgment is pure distinguishing within its own limits (§ 223), the idea realises in one both itself and its other. Consequently it is the certitude of the virtual identity between itself and the objective world. Reason comes to the world with an absolute faith in its ability to make the identity actual, and to raise its certitude to truth; and with the instinct of realising explicitly the nullity of that contrast which it sees to be implicitly null.

§ 225

This process is in general terms Cognition. In Cognition in a single act the contrast is virtually superseded, as regards both the one-sidedness of subjectivity and the one-sidedness of objectivity. At first, however, the supersession of the contrast is but implicit. The process as such is in consequence immediately infected with the finitude of this sphere, and splits into the twofold movement of the instinct of reason, presented as two

different movements. On the one hand it supersedes the one-sidedness of the Idea's subjectivity by receiving the existing world into itself, into subjective conception and thought; and with this objectivity, which is thus taken to be real and true, for its content it fills up the abstract certitude of itself. On the other hand, it supersedes the one-sidedness of the objective world, which is now, on the contrary, estimated as only a mere semblance, a collection of contingencies and shapes at bottom visionary. It modifies and informs that world by the inward nature of the subjective, which is here taken to be the genuine objective. The former is the instinct of science after Truth, Cognition properly so called — the Theoretical action of the idea. The latter is the instinct of the Good to fulfil the same — the Practical activity of the idea, or Volition.

[a] Cognition proper

§ 226

The universal finitude of Cognition, which lies in the one judgment, the presupposition of the contrast (§ 224) — a presupposition in contradiction of which its own act lodges protest — specialises itself more precisely on the face of its own idea. The result of that specialisation is that its two elements receive the aspect of being diverse from each other, and, as they are at least complete, they take up the relation of 'reflection', not of 'notion', to one another. The assimilation of the matter, therefore, as a datum, presents itself in the light of a reception of it into categories which at the same time remain external to it, and which meet each other in the same style of diversity. Reason is active here, but it is reason in the shape of understanding. The truth which such Cognition can reach will therefore be only finite: the infinite truth (of the notion) is isolated and made

transcendent, an inaccessible goal in a world of its own. Still in its external action cognition stands under the guidance of the notion, and notional principles form the secret clue to its movement.

The finitude of Cognition lies in the presupposition of a world already in existence, and in the consequent view of the knowing subject as a *tabula rasa*. The conception is one attributed to Aristotle; but no man is further than Aristotle from such an outside theory of Cognition. Such a style of Cognition does not recognise in itself the activity of the notion — an activity which it is implicitly, but not consciously. In its own estimation its procedure is passive. Really that procedure is active.

§ 227

Finite Cognition, when it presupposes what is distinguished from it to be something already existing and confronting it — to be the various facts of external nature or of consciousness — has, in the first place, (1) formal identity or the abstraction of universality for the form of its action. Its activity therefore consists in analysing the given concrete object, isolating its differences, and giving them the form of abstract universality. Or it leaves the concrete thing as a ground, and by setting aside the unessential-looking particulars, brings into relief a concrete universal, the Genus, or Force and Law. This is the Analytical Method.

People generally speak of the analytical and synthetic methods, as if it depended solely on our choice which we pursued. This is far from the case. It depends on the form of the objects of our investigation, which of the two methods that are derivable from the notion of finite cognition ought to be applied. In the first place, cognition is analytical. Analytical cognition deals with an object which is presented in detachment, and the aim of its action is to trace back to a universal the individual object before it. Thought in such circumstances means no more than an act of abstraction or of formal

identity. That is the sense in which thought is understood by Locke and all empiricists. Cognition, it is often said, can never do more than separate the given concrete objects into their abstract elements, and then consider these elements in their isolation. It is, however, at once apparent that this turns things upside down, and that cognition, if its purpose be to take things as they are, thereby falls into contradiction with itself. Thus the chemist e.g. places a piece of flesh in his retort, tortures it in many ways, and then informs us that it consists of nitrogen, carbon, hydrogen, etc. True: but these abstract matters have ceased to be flesh. The same defect occurs in the reasoning of an empirical psychologist when he analyses an action into the various aspects which it presents, and then sticks to these aspects in their separation. The object which is subjected to analysis is treated as a sort of onion from which one coat is peeled off after another.

§ 228

This universality is [b] also a specific universality. In this case the line of activity follows the three 'moments' of the notion, which (as it has not its infinity in finite cognition) is the specific or definite notion of understanding. The reception of the object into the forms of this notion is the Synthetic Method.

The movement of the Synthetic method is the reverse of the Analytical method. The latter starts from the individual, and proceeds to the universal; in the former the starting-point is given by the universal (as a definition), from which we proceed by particularising (in division) to the individual (the theorem). The Synthetic method thus presents itself as the development — the 'moments' of the notion on the object.

Definition, Division and Theorem

§ 229

[a] When the object has been in the first instance brought by cognition into the form of the specific notion in general, so that in this way its genus and its universal character or speciality are explicitly stated, we have the Definition. The materials and the proof of Definition are procured by means of the Analytical method (§ 227). The specific character however is expected to be a 'mark' only: that is to say it is to be in behoof only of the purely subjective cognition which is external to the object.

Definition involves the three organic elements of the notion: the universal or proximate genus (*genus proximum*), the particular or specific character of the genus (*qualitas specifica*), and the individual, or object defined. The first question that definition suggests, is where it comes from. The general answer to this question is to say, that definitions originate by way of analysis. This will explain how it happens that people quarrel about the correctness of proposed definitions; for here everything depends on what perceptions we started from, and what points of view we had before our eyes in so doing. The richer the object to be defined is, that is, the more numerous are the aspects which it offers to our notice, the more various are the definitions we may frame of it. Thus there are quite a host of definitions of life, of the state, etc. Geometry, on the contrary, dealing with a theme so abstract as space, has an easy task in giving definitions. Again, in respect of the matter or contents of the objects defined, there is no constraining necessity present. We are expected to admit that space exists, that there are plants, animals, etc., nor is it the business of geometry, botany, etc., to demonstrate that the objects in question necessarily are. This very circumstance makes the synthetic method of cognition as little suitable for philosophy as the analytical: for philosophy has above all things to leave no doubt of the necessity of its objects. And yet several attempts have been made to introduce the synthetic method into philosophy. Thus Spinoza, in particular, begins with definitions. He says, for instance, that substance is

the *causa sui*. His definitions are unquestionably a storehouse of the most speculative truth, but it takes the shape of dogmatic assertions. The same thing is also true of Schelling.

§ 230

[b] The statement of the second element of the notion, i.e. of the specific character of the universal as particularising, is given by Division in accordance with some external consideration.

Division we are told ought to be complete. That requires a principle or ground of division so constituted that the division based upon it embraces the whole extent of the region designated by the definition in general. But, in division, there is the further requirement that the principle of it must be borrowed from the nature of the object in question. If this condition be satisfied, the division is natural and not merely artificial, that is to say, arbitrary. Thus, in zoology, the ground of division adopted in the classification of the mammalia is mainly afforded by their teeth and claws. That is so far sensible, as the mammals themselves distinguish themselves from one another by these parts of their bodies back to which therefore the general type of their various classes is to be traced. In every case the genuine division must be controlled by the notion. To that extent a division, in the first instance, has three members: but as particularity exhibits itself as double, the division may go to the extent even of four members. In the sphere of mind trichotomy is predominant, a circumstance which Kant has the credit for bringing into notice

Theorem

§ 231

In the concrete individuality, where the mere unanalysed quality of the definition is regarded as a correlation of elements, the object is a synthetic nexus of distinct characteristics. It is a Theorem. Being different, these characteristics possess but a mediated identity. To supply the materials, which form the middle terms, is the office of Construction: and the process of mediation itself, from which cognition derives the necessity of that nexus, is the Demonstration.

As the difference between the analytical and synthetic methods is commonly stated, it seems entirely optional which of the two we employ. If we assume, to start with, the concrete thing which the synthetic method presents as a result, we can analyse from it as consequences the abstract propositions which formed the pre-suppositions and the material for the proof. Thus, algebraical definitions of curved lines are theorems in the method of geometry. Similarly even the Pythagorean theorem, if made the definition of a right-angled triangle, might yield to analysis those propositions which geometry had already demonstrated on is behoof. The optionalness of either method is due to both alike starting from an external presupposition. So far as the nature of the notion is concerned, analysis is prior, since it has to raise the given material with its empirical concreteness into the form of general abstractions, which may then be set in the front of the synthetic method as definitions.

That these methods, however indispensable and brilliantly successful in their own province, are unserviceable for philosophical cognition, is self-evident. They have presuppositions; and their style of cognition is that of understanding, proceeding under the canon of formal identity. In Spinoza, who was especially addicted to the use of the geometrical method, we are at once struck by its characteristic formalism. Yet his ideas were speculative in spirit; whereas the system of Wolf, who carried the method out to the height of pedantry, was even in subject-matter a metaphysic of the understanding.

The abuses which these methods with their formalism once led to in philosophy and science have in modern times been followed by the abuses of what is called 'Construction'. Kant brought into vogue the phrase that mathematics 'construes' its notions. All that was meant by the phrase was that mathematics has not to do with notions, but with abstract qualities of sense-perceptions. The name 'Construction (construing) of notions' has since been given to a sketch or statement of sensible attributes which were picked up from perception, quite guiltless of any influence of the notion, and to the additional formalism of classifying scientific and philosophical objects in a tabular form on some presupposed rubric, but in other respects at the fancy and discretion of the observer. In the background of all this, certainly, there is a dim consciousness of the Idea, of the unity of the notion and objectivity — a consciousness too that the idea is concrete. But that play of what is styled 'construing' is far from presenting this unity adequately, a unity which is none other than the notion properly so called: a perception is as little the concreteness of reason and the idea.

Another point calls for notice. Geometry works with the sensuous but abstract perception of space; and in space it experiences no difficulty in isolating and defining certain simple analytical modes.

To geometry alone therefore belongs in its perfection the synthetic method of finite cognition. In its course, however (and this is the remarkable point), it finally stumbles upon what are termed irrational and incommensurable quantities; and in their case any attempt at further specification drives it beyond the principle of the understanding. This is only one of many instances in terminology, where the title 'rational' is perversely applied to the province of understanding, while we stigmatise as irrational that which shows a beginning and a trace of rationality. Other sciences, removed as they are from the simplicity of space or number, often and necessarily reach a point where understanding permits no further

advance: but they get over the difficulty without trouble. They make a break in the strict sequence of their procedure, and assume whatever they require, though it be the reverse of what preceded, from some external quarter — opinion, perception, conception, or any other source. Its inobservancy as to the nature of its methods and their relativity to the subject-matter prevents this finite cognition from seeing that, when it proceeds by definitions and divisions, etc., it is really led on by the necessity of the laws of the notion. For the same reason it cannot see when it has reached its limit; nor, if it have transgressed that limit, does it perceive that it is in a sphere where the categories of understanding, which it still continues rudely to apply, have lost all authority.

§ 232

The necessity which finite cognition produces in the Demonstration is, in the first place, an external necessity, intended for the subjective intelligence alone. But in necessity as such, cognition itself has left behind its presupposition and starting-point, which consisted in accepting its content as given or found. Necessity qua necessity is implicitly the self-relating notion. The subjective idea has thus implicitly reached an original and objective determinateness — a something not-given, and for that reason immanent in the subject. It has passed over into the idea of Will.

The necessity which cognition reaches by means of the demonstration is the reverse of what formed its starting-point. In its starting-point cognition had a given and a contingent content; but now, at the close of its movement, it knows its content to be necessary. This necessity is reached by means of subjective agency. Similarly, subjectivity at starting was quite abstract, a bare tabula rasa. It now shows itself as a modifying and determining principle. In this way we pass from the idea of cognition to that of will. The passage, as will be apparent on a closer examination, means that the

universal, to be truly apprehended, must be apprehended as subjectivity, as a notion self-moving, active, and form-imposing.

[b] Volition

§ 233

The subjective idea as original and objective determinateness, and as a simple uniform content, is the Good. Its impulse towards self-realisation is in its behaviour the reverse of the idea of truth, and rather directed towards moulding the world it finds before it into a shape conformable to its purposed End. This Volition has, on the one hand, the certitude of the nothingness of the presupposed object; but, on the other, as finite, it at the same time presupposes the purposed End of the Good to be a mere subjective idea, and the object to be independent.

§ 234

This action of the Will is finite: and its finitude lies in the contradiction that in the inconsistent terms applied to the objective world the End of the Good is just as much not executed as executed, the end in question put as unessential as much as essential, as actual and at the same time as merely possible. This contradiction presents itself to imagination as an endless progress in the actualising of the Good; which is therefore set up and fixed as a mere ‘ought’, or goal of perfection. In point of form however this contradiction vanishes when the action supersedes the subjectivity of the purpose, and along with it the objectivity, with the contrast which makes both finite; abolishing subjectivity as a whole and not merely the one-sidedness of this form of it. (For another new subjectivity of the kind, that is, a new generation of the contrast, is not distinct from that which is supposed to be past and gone.) This return into itself is at the same time the

content’s own ‘recollection’ that it is the Good and the implicit identity of the two sides — it is a ‘recollection’ of the presupposition of the theoretical attitude of mind (§ 224) that the objective world is its own truth and substantiality.

While Intelligence merely proposes to take the world as it is, Will takes steps to make the world what it ought to be. Will looks upon the immediate and given present not as solid being, but as mere semblance without reality. It is here that we meet those contradictions which are so bewildering from the standpoint of abstract morality. This position in its ‘practical’ bearings is the one taken by the philosophy of Kant, and even by that of Fichte. The Good, say these writers, has to be realised: we have to work in order to produce it: and Will is only the Good actualising itself. If the world then were as it ought to be, the action of Will would be at an end. The Will itself therefore requires that its End should not be realised. In these words, a correct expression is given to the *finitude* of Will. But finitude was not meant to be the ultimate point: and it is the process of Will itself which abolishes finitude and the contradiction it involves. The reconciliation is achieved when Will in its result returns to the presupposition made by cognition. In other words, it consists in the unity of the theoretical and practical idea. Will knows the end to be its own, and Intelligence apprehends the world as the notion actual. This is the right attitude of rational cognition. Nullity and transitoriness constitute only the superficial features and not the real essence of the world. That essence is the notion in *posse* and in *esse*: and thus the world is itself the idea. All unsatisfied endeavour ceases, when we recognise that the final purpose of the world is accomplished no less than ever accomplishing itself. Generally speaking, this is the man’s way of looking; while the young imagine that the world is utterly sunk in wickedness, and that the first thing needful is a thorough transformation. The religious mind, on the contrary, views the world as

ruled by Divine Providence, and therefore correspondent with what it ought to be. But this harmony between the ‘is’ and the ‘ought to be’ is not torpid and rigidly stationary. Good, the final end of the world, has being, only while it constantly produces itself. And the world of spirit and the world of nature continue to have this distinction, that the latter moves only in a recurring cycle, while the former certainly also makes progress.

§ 235

Thus the truth of the Good is laid down as the unity of the theoretical and practical idea in the doctrine that the Good is radically and really achieved, that the objective world is in itself and for itself the Idea, just as it at the same time eternally lays itself down as End, and by action brings about its actuality. This life which has returned to itself from the bias and finitude of cognition, and which by the activity of the notion has become identical with it, is the Speculative or Absolute Idea.

(c) The Absolute Idea

§ 236

The Idea, as unity of the Subjective and Objective Idea, is the notion of the Idea — a notion whose object (*Gegenstand*) is the Idea as such, and for which the objective (*Objekt*) is Idea — an Object which embraces all characteristics in its unity. This unity is consequently the absolute and all truth, the Idea which thinks itself — and here at least as a thinking or Logical Idea.

The Absolute Idea is, in the first place, the unity of the theoretical and practical idea, and thus at the same time the unity of the idea of life with the idea of cognition. In cognition we had the idea in a biased, one-sided shape. The process of cognition has issued in the overthrow of this bias and the

restoration of that unity, which as unity, and in its immediacy, is in the first instance the Idea of Life. The defect of life lies in its being only the idea implicit or natural: whereas cognition is in an equally one-sided way the merely conscious idea, or the idea for itself. The unity and truth of these two is the Absolute Idea, which is both in itself and for itself. Hitherto *we* have had the idea in development through its various grades as *our* object, but now the idea comes to be its *own object*. This is the *noisis noiseos* which Aristotle long ago termed the supreme form of the idea.

§ 237

Seeing that there is in it no transition, or presupposition, and in general no specific character other than what is fluid and transparent, the Absolute Idea is for itself the pure form of the notion, which contemplates its contents as its own self. It is its own content, in so far as it ideally distinguishes itself from itself, and the one of the two things distinguished is a self-identity in which however is contained the totality of the form as the system of terms describing its content. This content is the system of Logic. All that is at this stage left as form for the idea is the Method of this content — the specific consciousness of the value and currency of the 'moments' in its development.

To speak of the absolute idea may suggest the conception that we are at length reaching the right thing and the sum of the whole matter. It is certainly possible to indulge in a vast amount of senseless declamation about the idea absolute. But its true content is only the whole system of which we have been hitherto studying the development. It may also be said in this strain that the absolute idea is the universal, but the universal not merely as an abstract form to which the particular content is a stranger, but as the absolute form, into which all the categories, the whole fullness of the content it has given being to, have retired. The absolute idea may in this

respect be compared to the old man who utters the same creed as the child, but for whom it is pregnant with the significance of a lifetime. Even if the child understands the truths of religion, he cannot but imagine them to be something outside of which lies the whole of life and the whole of the world. The same may be said to be the case with human life as a whole and the occurrences with which it is fraught. All work is directed only to the aim or end; and when it is attained, people are surprised to find nothing else but just the very thing which they had wished for. The interest lies in the whole movement. When a man traces up the steps of his life, the end may appear to him very restricted: but in it the whole *decursus vitae* is comprehended. So, too, the content of the absolute idea is the whole breadth of ground which has passed under our view up to this point. Last of all comes the discovery that the whole evolution is what constitutes the content and the interest. It is indeed the prerogative of the philosopher to see that everything, which, taken apart, is narrow and restricted, receives its value by its connection with the whole, and by forming an organic element of the idea. Thus it is that we have had the content already, and what we have now is the knowledge that the content is the living development of the idea. This simple retrospect is contained in the form of the idea. Each of the stages hitherto reviewed is an image of the absolute, but at first in a limited way, and thus it is forced onwards to the whole, the evolution of which is what we termed Method.

§ 238

The several steps or stages of the Speculative Method are, first of all, (a) the Beginning, which is Being or Immediacy: self-subsistent, for the simple reason that it is the beginning. But looked at from the speculative idea, Being is its self-specialising act, which as the absolute negativity or movement of the notion makes a judgment and puts itself as its own

negative. Being, which to the beginning as beginning seems mere abstract affirmation, is thus rather negation, dependency, derivation, and presupposition. But it is the notion of which Being is the negation: and the notion is completely self-identical in its otherness, and is the certainty of itself. Being therefore is the notion implicit, before it has been explicitly put as a notion. This Being therefore, as the still unspecified notion — a notion that is only implicitly or 'immediately' specified — is equally describable as the Universal.

When it means immediate being, the beginning is taken from sensation and perception — the initial stage in the analytical method of finite cognition. When it means universality, it is the beginning of the systematic method. But since the Logical Idea is as much a universal as it is in being — since it is presupposed by the notion as much as it itself immediately is, its beginning is a synthetic as well as an analytical beginning.

Philosophical method is analytical as well as synthetic, not indeed in the sense of a bare juxtaposition or mere alternating employment of these two methods of finite cognition, but rather in such a way that it holds them merged in itself. In every one of its movements therefore it displays an attitude at once analytical and synthetic. Philosophical thought proceeds analytically, in so far as it only accepts its object, the Idea, and while allowing it its own way, is only, as it were, an onlooker at its movement and development. To this extent philosophising is wholly passive. Philosophic thought however is equally synthetic, and evinces itself to be the action of the notion itself. To that end, however, there is required an effort to keep back the incessant impertinence of our own fancies and private opinions.

§ 239

(b) The Advance renders explicit the *judgment* implicit in the Idea. The immediate universal, as the notion implicit, is the dialectical force which on

its own part deposes its immediacy and universality to the level of a mere stage or 'moment'. Thus is put the negative of the beginning, its specific character: it supposes a correlative, a relation of different terms — the stage of Reflection.

Seeing that the immanent dialectic only states explicitly what was involved in the immediate notion, this advance is Analytical; but seeing that in this notion this distinction was not yet stated, it is equally Synthetic.

In the advance of the idea, the beginning exhibits itself as what it is implicitly. It is seen to be mediated and derivative, and neither to have proper being nor proper immediacy. It is only for the consciousness which is itself immediate, that Nature forms the commencement or immediacy and that Spirit appears as what is mediated by Nature. The truth, indeed, is that Nature is posited by Spirit, and Spirit itself in turn, uses Nature as its presupposition.

§ 240

The abstract form of the advance is, in Being, an other and transition into an other; in Essence showing or reflection in the opposite; in Notion, the distinction of individual from universality, which continues itself as such into, and is as an identity with, what is distinguished from it.

§ 241

In the second sphere the primarily implicit notion has come as far as shining, and thus is already the idea in germ. The development of this sphere becomes a regress into the first, just as the development of the first is a transition into the second. It is only by means of this double movement, that the difference first gets its due, when each of the two members distinguished, observed on its own part, completes itself to the totality, and in this way works out its unity with the other. It is only by both merging

their one-sidedness on their own part, that their unity is kept from becoming one-sided.

§ 242

The second sphere develops the relation of the different to what it primarily is — to the contradiction in its own nature. That contradiction which is seen in the infinite progress is resolved (c) into the end or terminus, where the difference is explicitly stated as what it is in notion. The end is the negative of the first, and as the identity with that, is the negativity of itself. It is consequently the unity in which both of these Firsts, the immediate and the real First, are made constituent stages in thought, merged, and at the same time preserved in the unity. The notion, which from its implicitness thus comes by means of its differentiation and the merging of that differentiation to close with itself, is the realised notion — the notion which contains the relativity or dependence of its special features in its own independence. It is the idea which, as absolutely first (in the method), regards this terminus as merely the disappearance of the show or semblance, which made the beginning appear immediate, and made itself seem a result. It is the knowledge that the idea is the one systematic whole.

§ 243

It thus appears that the method is not an extraneous form, but the soul and notion of the content, from which it is only distinguished, so far as the dynamic elements of the notion even on their own part come in their own specific character to appear as the totality of the notion. This specific character, or the content, leads itself with the form back to the idea; and thus the idea is presented as a systematic totality which is only one idea, of which the several elements are each implicitly the idea, while they equally by the dialectic of the notion produce the simple independence of the idea.

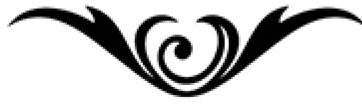
The science in this manner concludes by apprehending the notion of itself, as of the pure idea for which the idea is.

§ 244

The Idea which is independent or for itself, when viewed on the point of this unity with itself, is Perception or Intuition, and the percipient Idea is Nature. But as intuition the idea is, through an external ‘reflection’, invested with the one-sided characteristic of immediacy, or of negation. Enjoying however an absolute liberty, the Idea does not merely pass over into life, or as finite cognition allow life to show in it: in its own absolute truth it resolves to let the ‘moment’ of its particularity, or of the first characterisation and other-being, the immediate idea, as its reflected image, go forth freely as Nature.

We have now returned to the notion of the Idea with which we began. This return to the beginning is also an advance. We began with Being, abstract Being: where we now are we also have the Idea as Being: but this Idea which has Being is Nature.

Hegel’s Philosophy of Mind



PART III OF ‘ENCYCLOPEDIA OF THE PHILOSOPHICAL SCIENCES’

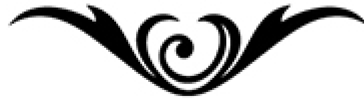
Translated with Five Introductory Essays by William Wallace

CONTENTS

Preface.

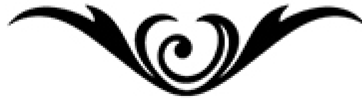
I HERE OFFER a translation of the third or last part of Hegel's encyclopaedic sketch of philosophy, — the *Philosophy of Mind*. The volume, like its subject, stands complete in itself. But it may also be regarded as a supplement or continuation of the work begun in my version of his *Logic*. I have not ventured upon the *Philosophy of Nature* which lies between these two. That is a province, to penetrate into which would require an equipment of learning I make no claim to, — a province, also, of which the present-day interest would be largely historical, or at least bound up with historical circumstances.

The translation is made from the German text given in the Second Part of the Seventh Volume of Hegel's Collected Works, occasionally corrected by comparison with that found in the second and third editions (of 1827 and 1830) published by the author. I have reproduced only Hegel's own paragraphs, and entirely omitted the *Zusätze* of the editors. These addenda — which are in origin lecture-notes — to the paragraphs are, in the text of the Collected Works, given for the first section only. The psychological part which they accompany has been barely treated elsewhere by Hegel: but a good popular exposition of it will be found in Erdmann's *Psychologische Briefe*. The second section was dealt with at greater length by Hegel himself in his *Philosophy of Law* (1820). The topics of the third section are largely covered by his lectures on Art, Religion, and History of Philosophy.



I do not conceal from myself that the text offers a hard nut to crack. Yet here and there, even through the medium of the translation, I think some light cannot fail to come to an earnest student. Occasionally, too, as, for instance, in §§ 406, 459, 549, and still more in §§ 552, 573, at the close of

which might stand the words *Liberavi animam meam*, the writer really "lets himself go," and gives his mind freely on questions where speculation comes closely in touch with life.



In the *Five Introductory Essays* I have tried sometimes to put together, and sometimes to provide with collateral elucidation, some points in the Mental Philosophy. I shall not attempt to justify the selection of subjects for special treatment further than to hope that they form a more or less connected group, and to refer for a study of some general questions of system and method to my *Prolegomena to the Study of Hegel's Philosophy* which appear almost simultaneously with this volume.

Five Introductory Essays In Psychology And Ethics.

Essay I. On The Scope Of A Philosophy Of Mind.

THE ART OF finding titles, and of striking out headings which catch the eye or ear, and lead the mind by easy paths of association to the subject under exposition, was not one of Hegel's gifts. A stirring phrase, a vivid or picturesque turn of words, he often has. But his lists of contents, when they cease to be commonplace, are apt to run into the bizarre and the grotesque. Generally, indeed, his rubrics are the old and (as we may be tempted to call them) insignificant terms of the text-books. But, in Hegel's use of them, these conventional designations are charged with a highly individualised meaning. They may mean more — they may mean less — than they habitually pass for: but they unquestionably specify their meaning with a unique and almost personal flavour. And this can hardly fail to create and to disappoint undue expectations.

(i.) Philosophy and its Parts.

Even the main divisions of his system show this conservatism in terminology. The names of the three parts of the Encyclopaedia are, we may say, non-significant of their peculiar contents. And that for a good reason. What Hegel proposes to give is no novel or special doctrine, but the universal philosophy which has passed on from age to age, here narrowed and there widened, but still essentially the same. It is conscious of its continuity and proud of its identity with the teachings of Plato and Aristotle.

The earliest attempts of the Greek philosophers to present philosophy in a complete and articulated order — attempts generally attributed to the Stoics, the schoolmen of antiquity — made it a tripartite whole. These three parts were Logic, Physics, and Ethics. In their entirety they were meant to

form a cycle of unified knowledge, satisfying the needs of theory as well as practice. As time went on, however, the situation changed: and if the old names remained, their scope and value suffered many changes. New interests and curiosities, due to altered circumstances, brought other departments of reality under the focus of investigation besides those which had been primarily discussed under the old names. Inquiries became more specialised, and each tended to segregate itself from the rest as an independent field of science. The result was that in modern times the territory still marked by the ancient titles had shrunk to a mere phantom of its former bulk. Almost indeed things had come to such a pass that the time-honoured figures had sunk into the misery of *rois fainéants*; while the real business of knowledge was discharged by the younger and less conventional lines of research which the needs and fashions of the time had called up. Thus Logic, in the narrow formal sense, was turned into an "art" of argumentation and a system of technical rules for the analysis and synthesis of academical discussion. Physics or Natural Philosophy restricted itself to the elaboration of some metaphysical postulates or hypotheses regarding the general modes of physical operation. And Ethics came to be a very unpractical discussion of subtleties regarding moral faculty and moral standard. Meanwhile a theory of scientific method and of the laws governing the growth of intelligence and formation of ideas grew up, and left the older logic to perish of formality and inanition. The successive departments of physical science, each in turn asserting its independence, finally left Natural Philosophy no alternative between clinging to its outworn hypotheses and abstract generalities, or identifying itself (as Newton in his great book put it) with the *Principia Mathematica* of the physical sciences. Ethics, in its turn, saw itself, on one hand, replaced by psychological inquiries into the relations between the feelings and the will and the intelligence; while, on the other hand, a host of social, historical,

economical, and other researches cut it off from the real facts of human life, and left it no more than the endless debates on the logical and metaphysical issues involved in free-will and conscience, duty and merit.

It has sometimes been said that Kant settled this controversy between the old departments of philosophy and the new branches of science. And the settlement, it is implied, consisted in assigning to the philosopher a sort of police and patrol duty in the commonwealth of science. He was to see that boundaries were duly respected, and that each science kept strictly to its own business. For this purpose each branch of philosophy was bound to convert itself into a department of criticism — an examination of first principles in the several provinces of reality or experience — with a view to get a distinct conception of what they were, and thus define exactly the lines on which the structures of more detailed science could be put up solidly and safely. This plan offered tempting lines to research, and sounded well. But on further reflection there emerge one or two difficulties, hard to get over. Paradoxical though it may seem, one cannot rightly estimate the capacity and range of foundations, before one has had some familiarity with the buildings erected upon them. Thus you are involved in a circle: a circle which is probably inevitable, but which for that reason it is well to recognise at once. Then — what is only another way of saying the same thing — it is impossible to draw an inflexible line between premises of principle and conclusions of detail. There is no spot at which criticism can stop, and, having done its business well, hand on the remaining task to dogmatic system. It was an instinctive feeling of this implication of system in what professed only to be criticism which led the aged Kant to ignore his own previous professions that he offered as yet no system, and when Fichte maintained himself to be erecting the fabric for which Kant had prepared the ground, to reply by the counter-declaration that the criticism was the system — that “the curtain was the picture.”

The Hegelian philosophy is an attempt to combine criticism with system, and thus realise what Kant had at least foretold. It is a system which is self-critical, and systematic only through the absoluteness of its criticism. In Hegel's own phrase, it is an immanent and an incessant dialectic, which from first to last allows finality to no dogmatic rest, but carries out Kant's description of an Age of Criticism, in which nothing, however majestic and sacred its authority, can plead for exception from the all-testing *Elenchus*. Then, on the other hand, Hegel refuses to restrict philosophy and its branches to anything short of the totality. He takes in its full sense that often-used phrase — the Unity of Knowledge. Logic becomes the all-embracing research of "first principles," — the principles which regulate physics and ethics. The old divisions between logic and metaphysic, between induction and deduction, between theory of reasoning and theory of knowledge, — divisions which those who most employed them were never able to show the reason and purpose of — because indeed they had grown up at various times and by "natural selection" through a vast mass of incidents: these are superseded and merged in one continuous theory of real knowledge considered under its abstract or formal aspect, — of organised and known reality in its underlying thought-system. But these first principles were only an abstraction from complete reality — the reality which nature has when unified by mind — and they presuppose the total from which they are derived. The realm of pure thought is only the ghost of the Idea — of the unity and reality of knowledge, and it must be reindued with its flesh and blood. The logical world is (in Kantian phrase) only the *possibility* of Nature and Mind. It comes first — because it is a system of First Principles: but these first principles could only be elicited by a philosophy which has realised the meaning of a mental experience, gathered by interpreting the facts of Nature.

Natural Philosophy is no longer — according to Hegel's view of it — merely a scheme of mathematical ground-work. That may be its first step. But its scope is a complete unity (which is not a mere aggregate) of the branches of natural knowledge, exploring both the inorganic and the organic world. In dealing with this endless problem, philosophy seems to be baulked by an impregnable obstacle to its progress. Every day the advance of specialisation renders any comprehensive or synoptic view of the totality of science more and more impossible. No doubt we talk readily enough of Science. But here, if anywhere, we may say there is no Science, but only sciences. The generality of science is a proud fiction or a gorgeous dream, variously told and interpreted according to the varying interest and proclivity of the scientist. The sciences, or those who specially expound them, know of no unity, no philosophy of science. They are content to remark that in these days the thing is impossible, and to pick out the faults in any attempts in that direction that are made outside their pale. Unfortunately for this contention, the thing is done by us all, and, indeed, has to be done. If not as men of science, yet as men — as human beings — we have to put together things and form some total estimate of the drift of development, of the unity of nature. To get a notion, not merely of the general methods and principles of the sciences, but of their results and teachings, and to get this not as a mere lot of fragments, but with a systematic unity, is indispensable in some degree for all rational life. The life not founded on science is not the life of man. But he will not find what he wants in the text-books of the specialist, who is obliged to treat his subject, as Plato says, "under the pressure of necessity," and who dare not look on it in its quality "to draw the soul towards truth, and to form the philosophic intellect so as to uplift what we now unduly keep down[1]." If the philosopher in this province does his work but badly, he may plead the novelty of the task to which he comes as a pioneer or even an architect. He

finds little that he can directly utilise. The materials have been gathered and prepared for very special aims; and the great aim of science — that human life may be made a higher, an ampler, and happier thing, — has hardly been kept in view at all, except in its more materialistic aspects. To the philosopher the supreme interest of the physical sciences is that man also belongs to the physical universe, or that Mind and Matter as we know them are (in Mr. Spencer's language) "at once antithetical and inseparable." He wants to find the place of Man, — but of Man as Mind — in Nature.

If the scope of Natural Philosophy be thus expanded to make it the unity and more than the synthetic aggregate of the several physical sciences — to make it the whole which surpasses the addition of all their fragments, the purpose of Ethics has not less to be deepened and widened. Ethics, under that title, Hegel knows not. And for those who cannot recognise anything unless it be clearly labelled, it comes natural to record their censure of Hegelianism for ignoring or disparaging ethical studies. But if we take the word in that wide sense which common usage rather justifies than adopts, we may say that the whole philosophy of Mind is a moral philosophy. Its subject is the moral as opposed to the physical aspect of reality: the inner and ideal life as opposed to the merely external and real materials of it: the world of intelligence and of humanity. It displays Man in the several stages of that process by which he expresses the full meaning of nature, or discharges the burden of that task which is implicit in him from the first. It traces the steps of that growth by which what was no better than a fragment of nature — an intelligence located (as it seemed) in one piece of matter — comes to realise the truth of it and of himself. That truth is his ideal and his obligation: but it is also — such is the mystery of his birthright — his idea and possession. He — like the natural universe — is (as the *Logic* has shown) a principle of unification, organisation, idealisation: and his history (in its ideal completeness) is the history of the process by which he, the

typical man, works the fragments of reality (and such mere reality must be always a collection of fragments) into the perfect unity of a many-sided character. Thus the philosophy of mind, beginning with man as a sentient organism, the focus in which the universe gets its first dim confused expression through mere feeling, shows how he "erects himself above himself" and realises what ancient thinkers called his kindred with the divine.

In that total process of the mind's liberation and self-realisation the portion specially called Morals is but one, though a necessary, stage. There are, said Porphyry and the later Platonists, four degrees in the path of perfection and self-accomplishment. And first, there is the career of honesty and worldly prudence, which makes the duty of the citizen. Secondly, there is the progress in purity which casts earthly things behind, and reaches the angelic height of passionless serenity. And the third step is the divine life which by intellectual energy is turned to behold the truth of things. Lastly, in the fourth grade, the mind, free and sublime in self-sustaining wisdom, makes itself an "exemplar" of virtue, and is even a "father of Gods." Even so, it may be said, the human mind is the subject of a complicated Teleology, — the field ruled by a multifarious Ought, psychological, aesthetical, social and religious. To adjust their several claims cannot be the object of any science, if adjustment means to supply a guide in practice. But it is the purpose of such a teleology to show that social requirements and moral duty as ordinarily conceived do not exhaust the range of obligation, — of the supreme ethical Ought. How that can best be done is however a question of some difficulty. For the ends under examination do not fall completely into a serial order, nor does one involve others in such a way as to destroy their independence. You cannot absolve psychology as if it stood independent of ethics or religion, nor can aesthetic considerations merely

supervene on moral. Still, it may be said, the order followed by Hegel seems on the whole liable to fewer objections than others.

Mr. Herbert Spencer, the only English philosopher who has even attempted a *System* of Philosophy, may in this point be compared with Hegel. He also begins with a *First Principles*, — a work which, like Hegel's *Logic*, starts by presenting Philosophy as the supreme arbiter between the subordinate principles of Religion and Science, which are in it "necessary correlatives." The positive task of philosophy is (with some inconsistency or vagueness) presented, in the next place, as a "unification of knowledge." Such a unification has to make explicit the implicit unity of known reality: because "every thought involves a whole system of thoughts." And such a programme might again suggest the Logic. But unfortunately Mr. Spencer does not (and he has Francis Bacon to justify him here) think it worth his while to toil up the weary, but necessary, mount of Purgatory which is known to us as Logic. With a naïve realism, he builds on Cause and Power, and above all on Force, that "Ultimate of Ultimates," which seems to be, however marvellously, a denizen both of the Known and the Unknowable world. In the known world this Ultimate appears under two forms, matter and motion, and the problem of science and philosophy is to lay down in detail and in general the law of their continuous redistribution, of the segregation of motion from matter, and the inclusion of motion into matter.

Of this process, which has no beginning and no end, — the rhythm of generation and corruption, attraction and repulsion, it may be said that it is properly not a first principle of all knowledge, but the general or fundamental portion of Natural Philosophy to which Mr. Spencer next proceeds. Such a philosophy, however, he gives only in part: viz. as a Biology, dealing with organic (and at a further stage and under other names, with supra-organic) life. And that the Philosophy of Nature should take this form, and carry both the First Principles and the later portions of the system

with it, as parts of a philosophy of evolution, is what we should have expected from the contemporaneous interests of science[2]. Even a one-sided attempt to give speculative unity to those researches, which get — for reasons the scientific specialist seldom asks — the title of biological, is however worth noting as a recognition of the necessity of a *Naturphilosophie*, — a speculative science of Nature.

The third part of the Hegelian System corresponds to what in the *Synthetic Philosophy* is known as Psychology, Ethics, and Sociology. And here Mr. Spencer recognises that something new has turned up. Psychology is "unique" as a science: it is a "double science," and as a whole quite *sui generis*. Whether perhaps all these epithets would not, *mutatis mutandis*, have to be applied also to Ethics and Sociology, if these are to do their full work, he does not say. In what this doubleness consists he even finds it somewhat difficult to show. For, as his fundamental philosophy does not on this point go beyond noting some pairs of verbal antitheses, and has no sense of unity except in the imperfect shape of a "relation[3]" between two things which are "antithetical and inseparable," he is perplexed by phrases such as "in" and "out of" consciousness, and stumbles over the equivocal use of "inner" to denote both mental (or non-spatial) in general, and locally sub-cuticular in special. Still, he gets so far as to see that the law of consciousness is that in it neither feelings nor relations have independent subsistence, and that the unit of mind does not begin till what he calls two feelings are made one. The phraseology may be faulty, but it shows an inkling of the *a priori*. Unfortunately it is apparently forgotten; and the language too often reverts into the habit of what he calls the "objective," i.e. purely physical, sciences.

Mr. Spencer's conception of Psychology restricts it to the more general physics of the mind. For its more concrete life he refers us to Sociology. But his Sociology is yet unfinished: and from the plan of its inception, and the

imperfect conception of the ends and means of its investigation, hardly admits of completion in any systematic sense. To that incipiency is no doubt due its excess in historical or anecdotal detail — detail, however, too much segregated from its social context, and in general its tendency to neglect normal and central theory for incidental and peripheral facts. Here, too, there is a weakness in First Principles and a love of catchwords, which goes along with the fallacy that illustration is proof. Above all, it is evident that the great fact of religion overhangs Mr. Spencer with the attraction of an unsolved and unacceptable problem. He cannot get the religious ideas of men into co-ordination with their scientific, aesthetic, and moral doctrines; and only betrays his sense of the high importance of the former by placing them in the forefront of inquiry, as due to the inexperience and limitations of the so-called primitive man. That is hardly adequate recognition of the religious principle: and the defect will make itself seriously felt, should he ever come to carry out the further stage of his prospectus dealing with "the growth and correlation of language, knowledge, morals, and aesthetics."

(ii.) Mind and Morals.

A Mental Philosophy — if we so put what might also be rendered a Spiritual Philosophy, or Philosophy of Spirit — may to an English reader suggest something much narrower than it actually contains. A Philosophy of the Human Mind — if we consult English specimens — would not imply much more than a psychology, and probably what is called an inductive psychology. But as Hegel understands it, it covers an unexpectedly wide range of topics, the whole range from Nature to Spirit. Besides Subjective Mind, which would seem on first thoughts to exhaust the topics of psychology, it goes on to Mind as Objective, and finally to Absolute mind. And such combinations of words may sound either self-contradictory or meaningless.

The first Section deals with the range of what is usually termed Psychology. That term indeed is employed by Hegel, in a restricted sense, to denote the last of the three sub-sections in the discussion of Subjective Mind. The Mind, which is the topic of psychology proper, cannot be assumed as a ready-made object, or datum. A Self, a self-consciousness, an intelligent and volitional agent, if it be the birthright of man, is a birthright which he has to realise for himself, to earn and to make his own. To trace the steps by which mind in its stricter acceptation, as will and intelligence, emerges from the general animal sensibility which is the crowning phase of organic life, and the final problem of biology, is the work of two preliminary sub-sections — the first entitled *Anthropology*, the second the *Phenomenology of Mind*.

The subject of Anthropology, as Hegel understands it, is the Soul — the raw material of consciousness, the basis of all higher mental life. This is a borderland, where the ground is still debateable between Nature and Mind: it is the region of feeling, where the sensibility has not yet been differentiated to intelligence. Soul and body are here, as the phrase goes, in communion: the inward life is still imperfectly disengaged from its natural co-physical setting. Still one with nature, it submits to natural influences and natural vicissitudes: is not as yet master of itself, but the half-passive receptacle of a foreign life, of a general vitality, of a common soul not yet fully differentiated into individuality. But it is awaking to self-activity: it is emerging to Consciousness, — to distinguish itself, as aware and conscious, from the facts of life and sentiency of which it is aware.

From this region of psychical physiology or physiological psychology, Hegel in the second sub-section of his first part takes us to the "Phenomenology of Mind," — to Consciousness. The sentient soul is also conscious — but in a looser sense of that word[4]: it has feelings, but can scarcely be said *itself* to know that it has them. As consciousness, the Soul

has come to separate what it is from what it feels. The distinction emerges of a subject which is conscious, and an object *of* which it is conscious. And the main thing is obviously the relationship between the two, or the Consciousness itself, as tending to distinguish itself alike from its subject and its object. Hence, perhaps, may be gathered why it is called Phenomenology of Mind. Mind as yet is not yet more than emergent or apparent: nor yet self-possessed and self-certified. No longer, however, one with the circumambient nature which it feels, it sees itself set against it, but only as a passive recipient of it, a *tabula rasa* on which external nature is reflected, or to which phenomena are presented. No longer, on the other hand, a mere passive instrument of suggestion from without, its instinct of life, its *nisus* of self-assertion is developed, through antagonism to a like *nisus*, into the consciousness of self-hood, of a Me and Mine as set against a Thee and Thine. But just in proportion as it is so developed in opposition to and recognition of other equally self-centred selves, it has passed beyond the narrower characteristic of Consciousness proper. It is no longer mere intelligent perception or reproduction of a world, but it is life, with perception (or apperception) of that life. It has returned in a way to its original unity with nature, but it is now the sense of its self-hood — the consciousness of itself as the focus in which subjective and objective are at one. Or, to put it in the language of the great champion of Realism[5], the standpoint of Reason or full-grown Mind is this: "The world which appears to us is our percept, therefore in us. The real world, out of which we explain the phenomenon, is our thought: therefore in us."

The third sub-section of the theory of Subjective Mind — the Psychology proper — deals with Mind. This is the real, independent Psyché — hence the special appropriation of the term Psychology. "The Soul," says Herbart, "no doubt dwells in a body: there are, moreover, corresponding states of the one and the other: but nothing corporeal occurs

in the Soul, nothing purely mental, which we could reckon to our Ego, occurs in the body: the affections of the body are no representations of the Ego, and our pleasant and unpleasant feelings do not immediately lie in the organic life they favour or hinder." Such a Soul, so conceived, is an intelligent and volitional self, a being of intellectual and "active" powers or phenomena: it is a Mind. And "Mind," adds Hegel[6], "is just this elevation above Nature and physical modes and above the complication with an external object." Nothing is *external* to it: it is rather the internalising of all externality. In this psychology proper, we are out of any immediate connexion with physiology. "Psychology as such," remarks Herbart, "has its questions common to it with Idealism" — with the doctrine that all reality is mental reality. It traces, in Hegel's exposition of it, the steps of the way by which mind realises that independence which is its characteristic standpoint. On the intellectual side that independence is assured in language, — the system of signs by which the intelligence stamps external objects as its own, made part of its inner world. A science, some one has said, is after all only *une langue bien faite*. So, reversing the saying, we may note that a language is an inwardised and mind-appropriated world. On the active side, the independence of mind is seen in self-enjoyment, in happiness, or self-content, where impulse and volition have attained satisfaction in equilibrium, and the soul possesses itself in fullness. Such a mind[7], which has made the world its certified possession in language, and which enjoys itself in self-possession of soul, called happiness, is a free Mind. And that is the highest which Subjective Mind can reach.

At this point, perhaps, having rounded off by a liberal sweep the scope of psychology, the ordinary mental philosophy would stop. Hegel, instead of finishing, now goes on to the field of what he calls Objective Mind. For as yet it has been only the story of a preparation, an inward adorning and equipment, and we have yet to see what is to come of it in actuality. Or

rather, we have yet to consider the social forms on which this preparation rests. The mind, self-possessed and sure of itself or free, is so only through the objective shape which its main development runs parallel with. An intelligent Will, or a practical reason, was the last word of the psychological development. But a reason which is practical, or a volition which is intelligent, is realised by action which takes regular shapes, and by practice which transforms the world. The theory of Objective Mind delineates the new form which nature assumes under the sway of intelligence and will. That intellectual world realises itself by transforming the physical into a social and political world, the given natural conditions of existence into a freely-instituted system of life, the primitive struggle of kinds for subsistence into the ordinances of the social state. Given man as a being possessed of will and intelligence, this inward faculty, whatever be its degree, will try to impress itself on nature and to reproduce itself in a legal, a moral, and social world. The kingdom of deed replaces, or rises on the foundation of, the kingdom of word: and instead of the equilibrium of a well-adjusted soul comes the harmonious life of a social organism. We are, in short, in the sphere of Ethics and Politics, of Jurisprudence and Morals, of Law and Conscience.

Here, — as always in Hegel's system — there is a triad of steps. First the province of Law or Right. But if we call it Law, we must keep out of sight the idea of a special law-giver, of a conscious imposition of laws, above all by a political superior. And if we call it Right, we must remember that it is neutral, inhuman, abstract right: the right whose principle is impartial and impassive uniformity, equality, order; — not moral right, or the equity which takes cognisance of circumstances, of personal claims, and provides against its own hardness. The intelligent will of Man, throwing itself upon the mere gifts of nature as their appointed master, creates the world of

Property — of things instrumental, and regarded as adjectival, to the human personality. But the autonomy of Reason (which is latent in the will) carries with it certain consequences. As it acts, it also, by its inherent quality of uniformity or universality, enacts for itself a law and laws, and creates the realm of formal equality or order-giving law. But this is a *mere* equality: which is not inconsistent with what in other respects may be excess of inequality. What one does, if it is really to be treated as done, others may or even must do: each act creates an expectation of continuance and uniformity of behaviour. The doer is bound by it, and others are entitled to do the like. The material which the person appropriates creates a system of obligation. Thus is constituted — in the natural give and take of rational Wills — in the inevitable course of human action and reaction, — a system of rights and duties. This law of equality — the basis of justice, and the seed of benevolence — is the scaffolding or perhaps rather the rudimentary framework of society and moral life. Or it is the bare skeleton which is to be clothed upon by the softer and fuller outlines of the social tissues and the ethical organs.

And thus the first range of Objective Mind postulates the second, which Hegel calls "Morality." The word is to be taken in its strict sense as a protest against the quasi-physical order of law. It is the morality of conscience and of the good will, of the inner rectitude of soul and purpose, as all-sufficient and supreme. Here is brought out the complementary factor in social life: the element of liberty, spontaneity, self-consciousness. The motto of mere inward morality (as opposed to the spirit of legality) is (in Kant's words): "There is nothing without qualification good, in heaven or earth, but only a good will." The essential condition of goodness is that the action be done with purpose and intelligence, and in full persuasion of its goodness by the conscience of the agent. The characteristic of Morality thus

described is its essential inwardness, and the sovereignty of the conscience over all heteronomy. Its justification is that it protests against the authority of a mere external or objective order, subsisting and ruling in separation from the subjectivity. Its defect is the turn it gives to this assertion of the rights of subjective conscience: briefly in the circumstance that it tends to set up a mere individualism against a mere universalism, instead of realising the unity and essential interdependence of the two.

The third sub-section of the theory of Objective Mind describes a state of affairs in which this antithesis is explicitly overcome. This is the moral life in a social community. Here law and usage prevail and provide the fixed permanent scheme of life: but the law and the usage are, in their true or ideal conception, only the unforced expression of the mind and will of those who live under them. And, on the other hand, the mind and will of the individual members of such a community are pervaded and animated by its universal spirit. In such a community, and so constituting it, the individual is at once free and equal, and that because of the spirit of fraternity, which forms its spiritual link. In the world supposed to be governed by mere legality the idea of right is exclusively prominent; and when that is the case, it may often happen that *summum jus summa injuria*. In mere morality, the stress falls exclusively on the idea of inward freedom, or the necessity of the harmony of the judgment and the will, or the dependence of conduct upon conscience. In the union of the two, in the moral community as normally constituted, the mere idea of right is replaced, or controlled and modified, by the idea of equity — a balance as it were between the two preceding, inasmuch as motive and purpose are employed to modify and interpret strict right. But this effect — this harmonisation — is brought about by the predominance of a new idea — the principle of benevolence, — a principle however which is itself modified by the fundamental idea of right or law[8] into a wise or regulated kindliness.

But what Hegel chiefly deals with under this head is the interdependence of form and content, of social order and personal progress. In the picture of an ethical organisation or harmoniously-alive moral community he shows us partly the underlying idea which gave room for the antithesis between law and conscience, and partly the outlines of the ideal in which that conflict becomes only the instrument of progress. This organisation has three grades or three typical aspects. These are the Family, Civil Society, and the State. The first of these, the Family, must be taken to include those primary unities of human life where the natural affinity of sex and the natural ties of parentage are the preponderant influence in forming and maintaining the social group. This, as it were, is the soul-nucleus of social organisation: where the principle of unity is an instinct, a feeling, an absorbing solidarity. Next comes what Hegel has called Civil Society, — meaning however by civil the antithesis to political, the society of those who may be styled *bourgeois*, not *citoyens*: — and meaning by society the antithesis to community. There are other natural influences binding men together besides those which form the close unities of the family, gens, tribe, or clan. Economical needs associate human beings within a much larger radius — in ways capable of almost indefinite expansion — but also in a way much less intense and deep. Civil Society is the more or less loosely organised aggregate of such associations, which, if, on one hand, they keep human life from stagnating in the mere family, on another, accentuate more sharply the tendency to competition and the struggle for life. Lastly, in the Political State comes the synthesis of family and society. Of the family; in so far as the State tends to develope itself on the nature-given unit of the Nation (an extended family, supplementing as need arises real descent by fictitious incorporations), and has apparently never permanently maintained itself except on the basis of a predominant common nationality. Of society; in so far as the extension and dispersion of

family ties have left free room for the differentiation of many other sides of human interest and action, and given ground for the full development of individuality. In consequence of this, the State (and such a state as Hegel describes is essentially the idea or ideal of the modern State)[9] has a certain artificial air about it. It can only be maintained by the free action of intelligence: it must make its laws public: it must bring to consciousness the principles of its constitution, and create agencies for keeping up unity of organisation through the several separate provinces or contending social interests, each of which is inclined to insist on the right of home mis-rule.

The State — which in its actuality must always be a quasi-national state — is thus the supreme unity of Nature and Mind. Its natural basis in land, language, blood, and the many ties which spring therefrom, has to be constantly raised into an intelligent unity through universal interests. But the elements of race and of culture have no essential connexion, and they perpetually incline to wrench themselves asunder. Blood and judgment are for ever at war in the state as in the individual[10]: the cosmopolitan interest, to which the maxim is *Ubi bene, ibi patria*, resists the national, which adopts the patriotic watchword of Hector[11]. The State however has another source of danger in the very principle that gave it birth. It arose through antagonism: it was baptised on the battlefield, and it only lives as it is able to assert itself against a foreign foe. And this circumstance tends to intensify and even pervert its natural basis of nationality: — tends to give the very conception of the political a negative and superficial look. But, notwithstanding all these drawbacks, the State in its Idea is entitled to the name Hobbes gave it, — the Mortal God. Here in a way culminates the obviously objective, — we may almost say, visible and tangible — development of Man and Mind. Here it attains a certain completeness — a union of reality and of ideality: a quasi-immortality, a quasi-universality. What the individual person could not do unaided, he can do in the strength

of his commonwealth. Much that in the solitary was but implicit or potential, is in the State actualised.

But the God of the State is a mortal God. It is but a national and a limited mind. To be actual, one must at least begin by restricting oneself. Or, rather actuality is rational, but always with a conditioned and a relative rationality[12]: it is in the realm of action and re-action, — in the realm of change and nature. It has warring forces outside it, — warring forces inside it. Its unity is never perfect: because it never produces a true identity of interests within, or maintains an absolute independence without. Thus the true and real State — the State in its Idea — the realisation of concrete humanity, — of Mind as the fullness and unity of nature — is not reached in any single or historical State: but floats away, when we try to seize it, into the endless progress of history. Always indeed the State, the historical and objective, points beyond itself. It does so first in the succession of times. *Die Weltgeschichte ist das Weltgericht.*[13] And in that doom of the world the eternal blast sweeps along the successive generations of the temporal, one expelling another from the stage of time — each because it is inadequate to the Idea which it tried to express, and has succumbed to an enemy from without because it was not a real and true unity within.

But if temporal flees away before another temporal, it abides in so far as it has, however inadequately, given expression and visible reality — as it points inward and upward — to the eternal. The earthly state is also the city of God; and if the republic of Plato seems to find scant admission into the reality of flesh and blood, it stands eternal as a witness in the heaven of idea. Behind the fleeting succession of consulates and dictatures, of aristocracy and empire, feuds of plebeian with patrician, in that apparent anarchy of powers which the so-called Roman constitution is to the superficial observer, there is the eternal Rome, one, strong, victorious, *semper eadem*: the Rome of Virgil and Justinian, the ghost whereof still

haunts with memories the seven-hilled city, but which with full spiritual presence lives in the law, the literature, the manners of the modern world. To find fitter expression for this Absolute Mind than it has in the Ethical community — to reach that reality of which the moral world is but one-sidedly representative — is the work of Art, Religion, and Philosophy. And to deal with these efforts to find the truth and the unity of Mind and Nature is the subject of Hegel's third Section.

(iii.) Religion and Philosophy.

It may be well at this point to guard against a misconception of this serial order of exposition[14]. As stage is seen to follow stage, the historical imagination, which governs our ordinary current of ideas, turns the logical dependence into a time-sequence. But it is of course not meant that the later stage follows the earlier in history. The later is the more real, and therefore the more fundamental. But we can only understand by abstracting and then transcending our abstractions, or rather by showing how the abstraction implies relations which force us to go further and beyond our arbitrary arrest. Each stage therefore either stands to that preceding it as an antithesis, which inevitably dogs its steps as an accusing spirit, or it is the conjunction of the original thesis with the antithesis, in a union which should not be called synthesis because it is a closer fusion and true marriage of minds. A truth and reality, though fundamental, is only appreciated at its true value and seen in all its force where it appears as the reconciliation and reunion of partial and opposing points of view. Thus, e.g., the full significance of the State does not emerge so long as we view it in isolation as a supposed single state, but only as it is seen in the conflict of history, in its actual "energy" as a world-power among powers, always pointing beyond itself to a something universal which it fain would be, and yet cannot be. Or, again, there never was a civil or economic society which existed save under the

wing of a state, or in one-sided assumption of state powers to itself: and a family is no isolated and independent unit belonging to a supposed patriarchal age, but was always mixed up with, and in manifold dependence upon, political and civil combinations. The true family, indeed, far from preceding the state in time, presupposes the political power to give it its precise sphere and its social stability: as is well illustrated by that typical form of it presented in the Roman state.

So, again, religion does not supervene upon an already existing political and moral system and invest it with an additional sanction. The true order would be better described as the reverse. The real basis of social life, and even of intelligence, is religion. As some thinkers quaintly put it, the known rests and lives on the bosom of the Unknowable. But when we say that, we must at once guard against a misconception. There are religions of all sorts; and some of them which are most heard of in the modern world only exist or survive in the shape of a traditional name and venerated creed which has lost its power. Nor is a religion necessarily committed to a definite conception of a supernatural — of a personal power outside the order of Nature. But in all cases, religion is a faith and a theory which gives unity to the facts of life, and gives it, not because the unity is in detail proved or detected, but because life and experience in their deepest reality inexorably demand and evince such a unity to the heart. The religion of a time is not its nominal creed, but its dominant conviction of the meaning of reality, the principle which animates all its being and all its striving, the faith it has in the laws of nature and the purpose of life. Dimly or clearly felt and perceived, religion has for its principle (one cannot well say, its object) not the unknowable, but the inner unity of life and knowledge, of act and consciousness, a unity which is certified in its every knowledge, but is never fully demonstrable by the summation of all its ascertained items. As such a felt and believed synthesis of the world and life, religion is the unity

which gives stability and harmony to the social sphere; just as morality in its turn gives a partial and practical realisation to the ideal of religion. But religion does not merely establish and sanction morality; it also frees it from a certain narrowness it always has, as of the earth. Or, otherwise put, morality has to the keener inspection something in it which is more than the mere moral injunction at first indicates. Beyond the moral, in its stricter sense, as the obligatory duty and the obedience to law, rises and expands the beautiful and the good: a beautiful which is disinterestedly loved, and a goodness which has thrown off all utilitarian relativity, and become a free self-enhancing joy. The true spirit of religion sees in the divine judgment not a mere final sanction to human morality which has failed of its earthly close, not the re-adjustment of social and political judgments in accordance with our more conscientious inner standards, but a certain, though, for our part-by-part vision, incalculable proportion between what is done and suffered. And in this liberation of the moral from its restrictions, Art renders no slight aid. Thus in different ways, religion presupposes morality to fill up its vacant form, and morality presupposes religion to give its laws an ultimate sanction, which at the same time points beyond their limitations.

But art, religion, and philosophy still rest on the national culture and on the individual mind. However much they rise in the heights of the ideal world, they never leave the reality of life and circumstance behind, and float in the free empyrean. Yet there are degrees of universality, degrees in which they reach what they promised. As the various psychical *nuclei* of an individual consciousness tend through the course of experience to gather round a central idea and by fusion and assimilation form a complete mental organisation; so, through the march of history, there grows up a complication and a fusion of national ideas and aspirations, which, though still retaining the individuality and restriction of a concrete national life, ultimately present an organisation social, aesthetic, and religious which is a

type of humanity in its universality and completeness. Always moving in the measure and on the lines of the real development of its social organisation, the art and religion of a nation tend to give expression to what social and political actuality at its best but imperfectly sets in existence. They come more and more to be, not mere competing fragments as set side by side with those of others, but comparatively equal and complete representations of the many-sided and many-voiced reality of man and the world. Yet always they live and flourish in reciprocity with the fullness of practical institutions and individual character. An abstractly universal art and religion is a delusion — until all diversities of geography and climate, of language and temperament, have been made to disappear. If these energies are in power and reality and not merely in name, they cannot be applied like a panacea or put on like a suit of ready-made clothes. If alive, they grow with individualised type out of the social situation: and they can only attain a vulgar and visible universality, so far as they attach themselves to some simple and uniform aspects, — a part tolerably identical everywhere — in human nature in all times and races.

Art, according to Hegel's account, is the first of the three expressions of Absolute Mind. But the key-note to the whole is to be found in Religion[15]: or Religion is the generic description of that phase of mind which has found rest in the fullness of attainment and is no longer a struggle and a warfare, but a fruition. "It is the conviction of all nations," he says[16], "that in the religious consciousness they hold their truth; and they have always regarded religion as their dignity and as the Sunday of their life. Whatever excites our doubts and alarms, all grief and all anxiety, all that the petty fields of finitude can offer to attract us, we leave behind on the shoals of time: and as the traveller on the highest peak of a mountain range, removed from every distinct view of the earth's surface, quietly lets his vision neglect all the restrictions of the landscape and the world; so in this pure region of faith

man, lifted above the hard and inflexible reality, sees it with his mind's eye reflected in the rays of the mental sun to an image where its discords, its lights and shades, are softened to eternal calm. In this region of mind flow the waters of forgetfulness, from which Psyche drinks, and in which she drowns all her pain: and the darknesses of this life are here softened to a dream-image, and transfigured into a mere setting for the splendours of the Eternal.'"

If we take Religion, in this extended sense, we find it is the sense, the vision, the faith, the certainty of the eternal in the changeable, of the infinite in the finite, of the reality in appearance, of the truth in error. It is freedom from the distractions and pre-occupations of the particular details of life; it is the sense of permanence, repose, certainty, rounding off, toning down and absorbing the vicissitude, the restlessness, the doubts of actual life. Such a victory over palpable reality has no doubt its origin — its embryology — in phases of mind which have been already discussed in the first section. Religion will vary enormously according to the grade of national mood of mind and social development in which it emerges. But whatever be the peculiarities of its original swaddling-clothes, its cardinal note will be a sense of dependence on, and independence in, something more permanent, more august, more of a surety and stay than visible and variable nature and man, — something also which whether God or devil, or both in one, holds the keys of life and death, of weal and woe, and holds them from some safe vantage-ground above the lower realms of change. By this central being the outward and the inward, past and present and to come, are made one. And as already indicated, Religion, emerging, as it does, from social man, from mind ethical, will retain traces of the two *foci* in society: the individual subjectivity and the objective community. Retain them however only as traces, which still show in the actually envisaged reconciliation. For that is what religion does to morality. It carries a step higher the unity or rather

combination gained in the State: it is the fuller harmony of the individual and the collectivity. The moral conscience rests in certainty and fixity on the religious.

But Religion (thus widely understood as the faith in sempiternal and all-explaining reality) at first appears under a guise of Art. The poem and the pyramid, the temple-image and the painting, the drama and the fairy legend, these are religion: but they are, perhaps, religion as Art. And that means that they present the eternal under sensible representations, the work of an artist, and in a perishable material of limited range. Yet even the carvers of a long-past day whose works have been disinterred from the plateaux of Auvergne knew that they gave to the perishable life around them a quasi-immortality: and the myth-teller of a savage tribe elevated the incident of a season into a perennial power of love and fear. The cynic may remind us that from the finest picture of the artist, readily

“We turn
To yonder girl that fords the burn.”

And yet it may be said in reply to the cynic that, had it not been for the deep-imprinted lesson of the artist, it would have been but a brutal instinct that would have drawn our eyes. The artist, the poet, the musician, reveal the meaning, the truth, the reality of the world: they teach us, they help us, backward younger brothers, to see, to hear, to feel what our rude senses had failed to detect. They enact the miracle of the loaves and fishes, again and again: out of the common limited things of every day they produce a bread of life in which the generations continue to find nourishment.

But if Art embodies for us the unseen and the eternal, it embodies it in the stone, the colour, the tone, and the word: and these are by themselves only dead matter. To the untutored eye and taste the finest picture-gallery is only a weariness: when the national life has drifted away, the sacred book

and the image are but idols and enigmas. “The statues are now corpses from which the vivifying soul has fled, and the hymns are words whence faith has departed: the tables of the Gods are without spiritual meat and drink, and games and feasts no longer afford the mind its joyful union with the being of being. The works of the Muse lack that intellectual force which knew itself strong and real by crushing gods and men in its winepress. They are now (in this iron age) what they are for us, — fair fruits broken from the tree, and handed to us by a kindly destiny. But the gift is like the fruits which the girl in the picture presents: she does not give the real life of their existence, not the tree which bore them, not the earth and the elements which entered into their substance, nor the climate which formed their quality, nor the change of seasons which governed the process of their growth. Like her, Destiny in giving us the works of ancient art does not give us their world, not the spring and summer of the ethical life in which they blossomed and ripened, but solely a memory and a suggestion of this actuality. Our act in enjoying them, therefore, is not a Divine service: were it so, our mind would achieve its perfect and satisfying truth. All that we do is a mere externalism, which from these fruits wipes off some rain-drop, some speck of dust, and which, in place of the inward elements of moral actuality that created and inspired them, tries from the dead elements of their external reality, such as language and historical allusion, to set up a tedious mass of scaffolding, not in order to live ourselves into them, but only to form a picture of them in our minds. But as the girl who proffers the plucked fruits is more and nobler than the natural element with all its details of tree, air, light, &c. which first yielded them, because she gathers all this together, in a nobler way, into the glance of the conscious eye and the gesture which proffers them; so the spirit of destiny which offers us those works of art is more than the ethical life and actuality of the ancient people: for it is the inwardising of that mind which in them was still self-estranged

and self-dispossessed: — it is the spirit of tragic destiny, the destiny which collects all those individualised gods and attributes of substance into the one Pantheon. And that temple of all the gods is Mind conscious of itself as mind[17]."

Religion enters into its more adequate form when it ceases to appear in the guise of Art and realises that the kingdom of God is within, that the truth must be *felt*, the eternal *inwardly* revealed, the holy one apprehended by *faith*[18], not by outward vision. Eye hath not seen, nor ear heard, the things of God. They cannot be presented, or delineated: they come only in the witness of the spirit. The human soul itself is the only worthy temple of the Most High, whom heaven, and the heaven of heavens, cannot contain. Here in truth God has come down to dwell with men; and the Son of Man, caught up in the effusion of the Spirit, can in all assurance and all humility claim that he is divinified. Here apparently Absolute Mind is reached: the soul knows no limitation, no struggle: in time it is already eternal. Yet, there is, according to Hegel, a flaw, — not in the essence and the matter, but in the manner and mode in which the ordinary religious consciousness represents to itself, or pictures that unification which it feels and experiences.

"In religion then this unification of ultimate Being with the Self is implicitly reached. But the religious consciousness, if it has this symbolic idea of its reconciliation, still has it as a mere symbol or representation. It attains the satisfaction by tacking on to its pure negativity, and that externally, the positive signification of its unity with the ultimate Being: its satisfaction remains therefore tainted by the antithesis of another world. Its own reconciliation, therefore, is presented to its consciousness as something far away, something far away in the future: just as the reconciliation which the other Self accomplished appears as a far-away thing in the past. The one Divine Man had but an implicit father and only an actual mother;

conversely the universal divine man, the community, has its own deed and knowledge for its father, but for its mother only the eternal Love, which it only *feels*, but does not *behold* in its consciousness as an actual immediate object. Its reconciliation therefore is in its heart, but still at variance with its consciousness, and its actuality still has a flaw. In its field of consciousness the place of implicit reality or side of pure mediation is taken by the reconciliation that lies far away behind: the place of the actually present, or the side of immediacy and existence, is filled by the world which has still to wait for its transfiguration to glory. Implicitly no doubt the world is reconciled with the eternal Being; and that Being, it is well known, no longer looks upon the object as alien to it, but in its love sees it as like itself. But for self-consciousness this immediate presence is not yet set in the full light of mind. In its immediate consciousness accordingly the spirit of the community is parted from its religious: for while the religious consciousness declares that they are implicitly not parted, this implicitness is not raised to reality and not yet grown to absolute self-certainty[19]."

Religion therefore, which as it first appeared in art-worship had yet to realise its essential inwardness or spirituality, so has now to overcome the antithesis in which its (the religious) consciousness stands to the secular. For the peculiarly religious type of mind is distinguished by an indifference and even hostility, more or less veiled, to art, to morality and the civil state, to science and to nature. Strong in the certainty of faith, or of its implicit rest in God, it resents too curious inquiry into the central mystery of its union, and in its distincter consciousness sets the foundation of faith on the evidence of a fact, which, however, it in the same breath declares to be unique and miraculous, the central event of the ages, pointing back in its reference to the first days of humanity, and forward in the future to the winding-up of the business of terrestrial life. Philosophy, according to Hegel's conception of it, does but draw the conclusion supplied by the

premisses of religion: it supplements and rounds off into coherence the religious implications. The unique events in Judea nearly nineteen centuries ago are for it also the first step in a new revelation of man's relationship to God: but while it acknowledges the transcendent interest of that age, it lays main stress on the permanent truth then revealed, and it insists on the duty of carrying out the principle there awakened to all the depth and breadth of its explication. Its task — its supreme task — is to *explicate religion*. But to do so is to show that religion is no exotic, and no *mere* revelation from an external source. It is to show that religion is the truth, the complete reality, of the mind that lived in Art, that founded the state and sought to be dutiful and upright: the truth, the crowning fruit of all scientific knowledge, of all human affections, of all secular consciousness. Its lesson ultimately is that there is nothing essentially common or unclean: that the holy is not parted off from the true and the good and the beautiful.

Religion thus expanded descends from its abstract or "intelligible" world, to which it had retired from art and science, and the affairs of ordinary life. Its God — as a true God — is not of the dead alone, but also of the living: not a far-off supreme and ultimate Being, but also a man among men. Philosophy thus has to break down the middle partition-wall of life, the fence between secular and sacred. It is but religion come to its maturity, made at home in the world, and no longer a stranger and a wonder. Religion has pronounced in its inmost heart and faith of faith, that the earth is the Lord's, and that day unto day shows forth the divine handiwork. But the heart of unbelief, of little faith, has hardly uttered the word, than it forgets its assurance and leans to the conviction that the prince of this world is the Spirit of Evil. The mood of Théodicée is also — but with a difference — the mood of philosophy. It asserts the ways of Providence: but its providence is not the God of the Moralist, or the ideal of the Artist, or rather is not these only, but also the Law of Nature, and more than that. Its

aim is the Unity of History. The words have sometimes been lightly used to mean that events run on in one continuous flow, and that there are no abrupt, no ultimate beginnings, parting age from age. But the Unity of History in its full sense is beyond history: it is history "reduced" from the expanses of time to the eternal present: its thousand years made one day, — made even the glance of a moment. The theme of the Unity of History — in the full depth of unity and the full expanse of history — is the theme of Hegelian philosophy. It traces the process in which Mind has to be all-inclusive, self-upholding, one with the Eternal reality.

"That process of the mind's self-realisation" says Hegel in the close of his *Phenomenology*, "exhibits a lingering movement and succession of minds, a gallery of images, each of which, equipped with the complete wealth of mind, only seems to linger because the Self has to penetrate and to digest this wealth of its Substance. As its perfection consists in coming completely to *know* what it *is* (its substance), this knowledge is its self-involution in which it deserts its outward existence and surrenders its shape to recollection. Thus self-involved, it is sunk in the night of its self-consciousness: but in that night its vanished being is preserved, and that being, thus in idea preserved, — old, but now new-born of the spirit, — is the new sphere of being, a new world, a new phase of mind. In this new phase it has again to begin afresh and from the beginning, and again nurture itself to maturity from its own resources, as if for it all that preceded were lost, and it had learned nothing from the experience of the earlier minds. Yet is that recollection a preservation of experience: it is the quintessence, and in fact a higher form, of the substance. If therefore this new mind appears only to count on its own resources, and to start quite fresh and blank, it is at the same time on a higher grade that it starts. The intellectual and spiritual realm, which is thus constructed in actuality, forms a succession in time, where one mind relieved another of its watch, and each took over the

kingdom of the world from the preceding. The purpose of that succession is to reveal the depth, and that depth is the absolute comprehension of mind: this revelation is therefore to uplift its depth, to spread it out in breadth, so negativing this self-involved Ego, wherein it is self-dispossessed or reduced to substance. But it is also its time: the course of time shows this dispossession itself dispossessed, and thus in its extension it is no less in its depth, the self. The way to that goal, — absolute self-certainty — or the mind knowing itself as mind — is the inwardising of the minds, as they severally are in themselves, and as they accomplish the organisation of their realm. Their conservation, — regarded on the side of its free and apparently contingent succession of fact — is history: on the side of their comprehended organisation, again, it is the science of mental phenomenology: the two together, comprehended history, form at once the recollection and the grave-yard of the absolute Mind, the actuality, truth, and certitude of his throne, apart from which he were lifeless and alone."

Such in brief outline — lingering most on the points where Hegel has here been briefest — is the range of the Philosophy of Mind. Its aim is to comprehend, not to explain: to put together in intelligent unity, not to analyse into a series of elements. For it psychology is not an analysis or description of mental phenomena, of laws of association, of the growth of certain powers and ideas, but a "comprehended history" of the formation of subjective mind, of the intelligent, feeling, willing self or ego. For it Ethics is part and only part of the great scheme or system of self-development; but continuing into greater concreteness the normal endowment of the individual mind, and but preparing the ground on which religion may be most effectively cultivated. And finally Religion itself, released from its isolation and other-world sacrosanctity, is shown to be only the crown of life, the ripest growth of actuality, and shown to be so by philosophy, whilst it is made clear that religion is the basis of philosophy, or that a philosophy

can only go as far as the religious stand-point allows. The hierarchy, if so it be called, of the spiritual forces is one where none can stand alone, or claim an abstract and independent supremacy. The truth of egoism is the truth of altruism: the truly moral is the truly religious: and each is not what it professes to be unless it anticipate the later, or include the earlier.

(iv.) Mind or Spirit.

It may be said, however, that for such a range of subjects the term Mind is wretchedly inadequate and common-place, and that the better rendering of the title would be Philosophy of Spirit. It may be admitted that Mind is not all that could be wished. But neither is Spirit blameless. And, it may be added, Hegel's own term *Geist* has to be unduly strained to cover so wide a region. It serves — and was no doubt meant to serve — as a sign of the conformity of his system with the religion which sees in God no other-world being, but our very self and mind, and which worships him in spirit and in truth. And if the use of a word like this could allay the "ancient variance" between the religious and the philosophic mood, it would be but churlish perhaps to refuse the sign of compliance and compromise. But whatever may be the case in German, — and even there the new wine was dangerous to the old wine-skin — it is certain that to average English ears the word Spiritual would carry us over the medium line into the proper land of religiosity. And to do that, as we have seen, is to sin against the central idea: the idea that religion is of one blood with the whole mental family, though the most graciously complete of all the sisters. Yet, however the word may be chosen, the philosophy of Hegel, like the august lady who appeared in vision to the emprisoned Boëthius, has on her garment a sign which "signifies the life which is on earth," as also a sign which signifies the "right law of heaven"; if her right-hand holds the "book of the justice of

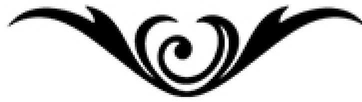
the King omnipotent," the sceptre in her left is "corporal judgment against sin[20]."

There is indeed no sufficient reason for contemning the term Mind. If Inductive Philosophy of the Human Mind has — perhaps to a dainty taste — made the word unsavoury, that is no reason for refusing to give it all the wealth of soul and heart, of intellect and will. The *mens aeterna* which, if we hear Tacitus, expressed the Hebrew conception of the spirituality of God, and the Νοῦς which Aristotelianism set supreme in the Soul, are not the mere or abstract intelligence, which late-acquired habits of abstraction have made out of them. If the reader will adopt the term (in want of a better) in its widest scope, we may shelter ourselves under the example of Wordsworth. His theme is — as he describes it in the *Recluse*— "the Mind and Man": his

"voice proclaims
How exquisitely the individual Mind
(And the progressive powers perhaps no less
Of the whole species) to the external World
Is fitted; — and how exquisitely too
The external World is fitted to the Mind;
And the creation (by no lower name
Can it be called) which they with blended might
Accomplish."

The verse which expounds that "high argument" speaks
"Of Truth, of Grandeur, Beauty, Love and Hope
And melancholy Fear subdued by Faith."

And the poet adds:
"As we look
Into our Minds, into the Mind of Man —
My haunt, and the main region of my song;



Beauty — a living Presence of the earth
Surpassing the most fair ideal forms
... waits upon my steps."
The reality duly seen in the spiritual vision
"That inspires
The human Soul of universal earth
Dreaming of things to come"
will be a greater glory than the ideals of imaginative fiction ever fancied:
"For the discerning intellect of Man,
When wedded to this goodly universe
In love and holy passion, shall find these
A simple produce of the common day."

If Wordsworth, thus, as it were, echoing the great conception of Francis Bacon,

"Would chant, in lonely peace, the spousal verse
Of this great consummation,"

perhaps the poet and the essayist may help us with Hegel to rate the Mind — the Mind of Man — at its highest value.

Essay II. Aims And Methods Of Psychology.

It is not going too far to say that in common estimation psychology has as yet hardly reached what Kant has called the steady walk of science — *der sichere Gang der Wissenschaft*. To assert this is not, of course, to throw any doubts on the importance of the problems, or on the intrinsic value of the results, in the studies which have been prosecuted under that name. It is only to note the obvious fact that a number of inquiries of somewhat discrepant tone, method, and tendency have all at different times covered themselves under the common title of psychological, and that the work of orientation is as yet incomplete. Such a destiny seems inevitable, when a name is coined rather as the title of an unexplored territory, than fixed on to describe an accomplished fact.

(i.) Psychology as a Science and as a Part of Philosophy.

The *De Anima* of Aristotle, gathering up into one the work of Plato and his predecessors, may be said to lay the foundation of psychology. But even in it, we can already see that there are two elements or aspects struggling for mastery: two elements not unrelated or independent, but hard to keep fairly and fully in unity. On one hand there is the conception of Soul as a part of Nature, as a grade of existence in the physical or natural universe, — in the universe of things which suffer growth and change, which are never entirely "without matter," and are always attached to or present in body. From this point of view Aristotle urged that a sound and realistic psychology must, e.g. in its definition of a passion, give the prominent place to its physical (or material) expression, and not to its mental form or significance. It must

remember, he said, that the phenomena or "accidents" are what really throw light on the nature or the "substance" of the Soul. On the other hand, there are two points to be considered. There is, first of all, the counterpoising remark that the conception of Soul as such, as a unity and common characteristic, will be determinative of the phenomena or "accidents," — will settle, as it were, what we are to observe and look for, and how we are to describe our observations. And by the *conception* of Soul, is meant not *a* soul, as a thing or agent (subject) which has properties attaching to it; but soul, as the generic feature, the universal, which is set as a stamp on everything that claims to be psychical. In other words, Soul is one, not as a single thing contrasted with its attributes, activities, or exercises of force (such single thing will be shown by logic to be a metaphysical fiction); but as the unity of form and character, the comprehensive and identical feature, which is present in all its manifestations and exercises. But there is a second consideration. The question is asked by Aristotle whether it is completely and strictly accurate to put Soul under the category of natural objects. There is in it, or of it, perhaps, something, and something essential to it, which belongs to the order of the eternal and self-active: something which is "form" and "energy" quite unaffected by and separate from "matter." How this is related to the realm of the perishable and changeable is a problem on which Aristotle has been often (and with some reason) believed to be obscure, if not even inconsistent[21].

In these divergent elements which come to the fore in Aristotle's treatment we have the appearance of a radical difference of conception and purpose as to psychology. He himself does a good deal to keep them both in view. But it is evident that here already we have the contrast between a purely physical or (in the narrower sense) "scientific" psychology, empirical and realistic in treatment, and a more philosophical — what in certain quarters would be called a speculative or metaphysical — conception of the

problem. There is also in Aristotle the antithesis of a popular or superficial, and an accurate or analytic, psychology. The former is of a certain use in dealing, say, with questions of practical ethics and education: the latter is of more strictly scientific interest. Both of these distinctions — that between a speculative and an empirical, and that between a scientific and a popular treatment — affect the subsequent history of the study. Psychology is sometimes understood to mean the results of casual observation of our own minds by what is termed introspection, and by the interpretation of what we may observe in others. Such observations are in the first place carried on under the guidance of distinctions or points of view supplied by the names in common use. We interrogate our own consciousness as to what facts or relations of facts correspond to the terms of our national language. Or we attempt — what is really an inexhaustible quest — to get definite divisions between them, and clear-cut definitions. Inquiries like these which start from popular distinctions fall a long way short of science: and the inquirer will find that accidental and essential properties are given in the same handful of conclusions. Yet there is always much value in these attempts to get our minds cleared: and it is indispensable for all inquiries that all alleged or reported facts of mind should be realised and reproduced in our own mental experience. And this is especially the case in psychology, just because here we cannot get the object outside us, we cannot get or make a diagram, and unless we give it reality by re-constructing it, — by re-interrogating our own experience, our knowledge of it will be but wooden and mechanical. And the term introspection need not be too seriously taken: it means much more than watching passively an internal drama; and is quite as well describable as mental projection, setting out what was within, and so as it were hidden and involved, before ourselves in the field of mental vision. Here, as always, the essential point is to get ourselves well out of the

way of the object observed, and to stand, figuratively speaking, quite on one side.

But even at the best, such a popular or empirical psychology has no special claim to be ranked as science. It may no doubt be said that at least it collects, describes, or notes down facts. But even this is not so certain as it seems. Its so-called facts are very largely fictions, or so largely interpolated with error, that they cannot be safely used for construction. If psychology is to accomplish anything valuable, it must go more radically to work. It must — at least in a measure — discard from its preliminary view the data of common and current distinctions, and try to get at something more primary or ultimate as its starting-point. And this it may do in two ways. It may, in the one case, follow the example of the physical sciences. In these it is the universal practice to assume that the explanation of complex and concrete facts is to be attained by (*a*) postulating certain simple elements (which we may call atoms, molecules, and perhaps units or monads), which are supposed to be clearly conceivable and to justify themselves by intrinsic intelligibility, and by (*b*) assuming that these elements are compounded and combined according to laws which again are in the last resort self-evident, or such that they seem to have an obvious and palpable lucidity. Further, such laws being always axioms or plain postulates of mechanics (for these alone possess this feature of self-evident intelligibility), they are subject to and invite all the aids and refinements of the higher mathematical calculus. What the primary and self-explicative bits of psychical reality may be, is a further question on which there may be some dispute. They may be, so to say, taken in a more physical or in a more metaphysical way: i.e. more as units of nerve-function or more as elements of ideative-function. And there may be differences as to how far and in what provinces the mathematical calculus may be applicable. But, in any case, there will be a strong tendency in psychology, worked on this plan, to follow, *mutatis mutandis*, and at

some distance perhaps, the analogy of material physics. In both the justification of the postulated units and laws will be their ability to describe and systematise the observed phenomena in a uniform and consistent way.

The other way in which psychology gets a foundation and ulterior certainty is different, and goes deeper. After all, the "scientific" method is only a way in which the facts of a given sphere are presented in thoroughgoing interconnexion, each reduced to an exact multiple or fraction of some other, by an inimitably continued subtraction and addition of an assumed homogeneous element, found or assumed to be perfectly imaginable (conceivable). But we may also consider the province in relation to the whole sphere of reality, may ask what is its place and meaning in the whole, what reality is in the end driving at or coming to be, and how far this special province contributes to that end. If we do this, we attach psychology to philosophy, or, if we prefer so to call it, to metaphysics, as in the former way we established it on the principles generally received as governing the method of the physical sciences.

This — the relation of psychology to fundamental philosophy — is a question which also turns up in dealing with Ethics. There is on the part of those engaged in either of these inquiries a certain impatience against the intermeddling (which is held to be only muddling) of metaphysics with them. It is clear that in a very decided way both psychology and ethics can, up to some extent at least, be treated as what is called empirical (or, to use the more English phrase, inductive) sciences. On many hands they are actually so treated: and not without result. Considering the tendency of metaphysical inquiries, it may be urged that it is well to avoid preliminary criticism of the current conceptions and beliefs about reality which these sciences imply. Yet such beliefs are undoubtedly present and effective. Schopenhauer has popularised the principle that the pure empiricist is a fiction, that man is a radically metaphysical animal, and that he inevitably

turns what he receives into a part of a dogmatic creed — a conviction how things ought to be. Almost without effort there grows up in him, or flows in upon him, a belief and a system of beliefs as to the order and values of things. Every judgment, even in logic, rests on such an order of truth. He need not be able to formulate his creed: it will influence him none the less: nay, his faith will probably seem more a part of the solid earth and common reality, the less it has been reduced to a determinate creed or to a code of principles. For such formulation presupposes doubt and scepticism, which it beats back by mere assertion. Each human being has such a background of convictions which govern his actions and conceptions, and of which it so startles him to suggest the possibility of a doubt, that he turns away in dogmatic horror. Such ruling ideas vary, from man to man, and from man to woman — if we consider them in all their minuteness. But above all they constitute themselves in a differently organised system or aggregate according to the social and educational stratum to which an individual belongs. Each group, engaged in a common task, it may be in the study of a part of nature, is ideally bound and obliged by a common language, and special standards of truth and reality for its own. Such a group of ideas is what Bacon would have called a scientific fetich or *idolum theatri*. A scientific *idolum* is a traditional belief or dogma as to principles, values, and methods, which has so thoroughly pervaded the minds of those engaged in a branch of inquiry, that they no longer recognise its hypothetical character, — its relation of means to the main end of their function.

Such a collected and united theory of reality (it is what Hegel has designated the Idea) is what is understood by a natural metaphysic. It has nothing necessarily to do with a supersensible or a supernatural, if these words mean a ghostly, materialised, but super-finely-materialised nature, above and beyond the present. But that there is a persistent tendency to conceive the unity and coherence, the theoretic idea of reality, in this

pseudo-sensuous (i.e. super-sensuous) form, is of course a well-known fact. For the present, however, this aberration — this idol of the tribe — may be left out of sight. By a metaphysic or fundamental philosophy, is, in the present instance, meant a system of first principles — a secular and cosmic creed: a belief in ends and values, a belief in truth — again premising that the system in question is, for most, a rudely organised and almost inarticulate mass of belief and hope, conviction and impression. It is, in short, a *natural* metaphysic: a metaphysic, that is, which has but an imperfect coherence, which imperfectly realises both its nature and its limits.

In certain parts, however, it is more and better than this crude background of belief. Each science — or at least every group of sciences — has a more definite system or aggregate of first principles, axioms, and conceptions belonging to it. It has, that is, — and here in a much distincter way — its special standard of reality, its peculiar forms of conceiving things, its distinctions between the actual and the apparent, &c. Here again it will probably be found that the scientific specialist is hardly conscious that these are principles and concepts: on the contrary, they will be supposed self-evident and ultimate facts, foundations of being. Instead of being treated as modes of conception, more or less justified by their use and their results, these categories will be regarded as fundamental facts, essential conditions of all reality. Like popular thought in its ingrained categories, the specialist cannot understand the possibility of any limitation to his radical ideas of reality. To him they are not hypotheses, but principles. The scientific specialist may be as convinced of the universal application of his peculiar categories, as the Chinese or the Eskimo that his standards are natural and final.

Under such metaphysical or extra-empirical presuppositions all investigation, whether it be crudely empirical or (in the physical sense) scientific, is carried on. And when so carried on, it is said to be prosecuted apart from any interference from metaphysic. Such a naïve or natural metaphysic, not raised to explicit consciousness, not followed as an imposed rule, but governing with the strength of an immanent faith, does not count for those who live under it as a metaphysic at all. M. Jourdain was amazed suddenly to learn he had been speaking prose for forty years without knowing it. But in the present case there is something worse than amazement sure to be excited by the news. For the critic who thus reveals the secrets of the scientist's heart is pretty sure to go on to say that a good deal of this naïve unconscious metaphysic is incoherent, contradictory, even bad: that it requires correction, revision, and readjustment, and has by criticism to be made one and harmonious. That readjustment or criticism which shall eliminate contradiction and produce unity, is the aim of the *science* of metaphysic — the science of the meta-physical element in physical knowledge: what Hegel has chosen to call the Science of Logic (in the wide sense of the term). This higher Logic, this *science* of metaphysic, is the process to revise and harmonise in systematic completeness the imperfect or misleading and partial estimates of reality which are to be found in popular and scientific thought.

In the case of the run of physical sciences this revision is less necessary; and for no very recondite reason. Every science by its very nature deals with a special, a limited topic. It is confined to a part or aspect of reality. Its propositions are not complete truths; they apply to an artificial world, to a part expressly cut off from the concrete reality. Its principles are generally cut according to their cloth, — according to the range in which they apply. The only danger that can well arise is if these categories are transplanted without due reservations, and made of universal application, i.e. if the

scientist elects on his speciality to pronounce *de omnibus rebus*. But in the case of psychology and ethics the harmlessness of natural metaphysics will be less certain. Here a general human or universal interest is almost an inevitable coefficient: especially if they really rise to the full sweep of the subject. For as such they both seem to deal not with a part of reality, but with the very centre and purpose of all reality. In them we are not dealing with topics of secondary interest, but with the very heart of the human problem. Here the questions of reality and ideals, of unity and diversity, and of the evaluation of existence, come distinctly to the fore. If psychology is to answer the question, What am I? and ethics the question, What ought I to do? they can hardly work without some formulated creed of metaphysical character, without some preliminary criticisms of current first principles.

(ii.) Herbart.

The German thinker, who has given perhaps the most fruitful stimulus to the scientific study of psychology in modern times — Johann Friedrich Herbart — is after all essentially a philosopher, and not a mere scientist, even in his psychology. His psychological inquiry, that is, stands in intimate connexion with the last questions of all intelligence, with metaphysics and ethics. The business of philosophy, says Herbart, is to touch up and finish off conceptions (*Bearbeitung der Begriffe*)[22]. It finds, as it supervenes upon the unphilosophical world, that mere and pure facts (if there ever are or were such purisms) have been enveloped in a cloud of theory, have been construed into some form of unity, but have been imperfectly, inadequately construed: and that the existing concepts in current use need to be corrected, supplemented and readjusted. It has, accordingly, for its work to "reconcile experience with itself[23]," and to elicit "the hidden pre-suppositions without which the fact of experience is unthinkable." Psychology, then, as a branch of this philosophic enterprise, has to readjust the facts discovered in inner

experience. For mere uncritical experience or merely empirical knowledge only offers *problems*; it suggests gaps, which indeed further reflection serves at first only to deepen into contradictions. Such a psychology is "speculative": i.e. it is not content to accept the mere given, but goes forward and backward to find something that will make the fact intelligible. It employs totally different methods from the "classification, induction, analogy" familiar to the logic of the empirical sciences. Its "principles," therefore, are not given facts: but facts which have been manipulated and adjusted so as to lose their self-contradictory quality: they are facts "reduced," by introducing the omitted relationships which they postulate if they are to be true and self-consistent[24]. While it is far from rejecting or ignoring experience, therefore, psychology cannot strictly be said to build upon it alone. It uses experimental fact as an unfinished datum, — or it sees in experience a torso which betrays its imperfection, and suggests completing.

The starting-point, it may be said, of Herbart's psychology is a question which to the ordinary psychologist (and to the so-called scientific psychologist) has a secondary, if it have any interest. It was, he says, the problem of Personality, the problem of the Self or Ego, which first led to his characteristic conception of psychological method. "My first discovery," he tells us[25], "was that the Self was neither primitive nor independent, but must be the most dependent and most conditioned thing one can imagine. The second was that the elementary ideas of an intelligent being, if they were ever to reach the pitch of self-consciousness, must be either all, or at least in part, opposed to each other, and that they must check or block one another in consequence of this opposition. Though held in check, however, these ideas were not to be supposed lost: they subsist as endeavours or tendencies to return into the position of actual idea, as soon as the check became, for any reason, either in whole or in part inoperative. This check could and

must be calculated, and thus it was clear that psychology required a mathematical as well as a metaphysical foundation."

The place of the conception of the Ego in Kant's and Fichte's theory of knowledge is well known. Equally well known is Kant's treatment of the soul-reality or soul-substance in his examination of Rational Psychology. Whereas the (logical) unity of consciousness, or "synthetic unity of apperception," is assumed as a fundamental starting-point in explanation of our objective judgments, or of our knowledge of objective existence, its real (as opposed to its formal) foundation in a "substantial" soul is set aside as an illegitimate interpretation of, or inference from, the facts of inner experience. The belief in the separate unity and persistence of the soul, said Kant, is not a scientifically-warranted conclusion. Its true place is as an ineffaceable postulate of the faith which inspires human life and action. Herbart did not rest content with either of these — as he believed — dogmatic assumptions of his master. He did not fall in cheerfully with the idealism which seemed ready to dispense with a soul, or which justified its acceptance of empirical reality by referring to the fundamental unity of the function of judgment. With a strong bent towards fully-differentiated and individualised experience Herbart conjoined a conviction of the need of logical analysis to prevent us being carried away by the first-come and inadequate generalities. The Ego which, in its extremest abstraction, he found defined as the unity of subject and object, did not seem to him to offer the proper guarantees of reality: it was itself a problem, full of contradictions, waiting for solution. On the other hand, the real Ego, or self of concrete experience, is very much more than this logical abstract, and differs widely from individual to individual, and apparently from time to time even in the same individual. Our self, of which we talk so fluently, as one and the self-same — how far does it really possess the continuity and identity with which we credit it? Does it not rather seem to be an ideal

which we gradually form and set before ourselves as the standard for measuring our attainments of the moment, — the perfect fulfilment of that oneness of being and purpose and knowledge which we never reach? Sometimes even it seems no better than a name which we move along the varying phenomena of our inner life, at one time identifying it with the power which has gained the victory in a moral struggle, at another with that which has been defeated[26], according as the attitude of the moment makes us throw now one, now another, aspect of mental activity in the foreground.

The other — or logical Ego — the mere identity of subject and object, — when taken in its utter abstractness and simplicity, shrivels up to something very small indeed — to a something which is little better than nothing. The mere *I* which is not contra-distinguished by a *Thou* and a *He* — which is without all definiteness of predication (the I=I of Fichte and Schelling) — is only as it were a point of being cut off from all its connexions in reality, and treated as if it were or could be entirely independent. It is an identity in which subject and object have not yet appeared: it is not a real I, though we may still retain the name. It is — as Hegel's *Logic* will tell us — exactly definable as Being, which is as yet Nothing: the impossible edge of abstraction on which we try — and in vain — to steady ourselves at the initial point of thought. And to reach or stand at that intangible, ungraspable point, which slips away as we approach, and transmutes itself as we hold it, is not the natural beginning, but the result of introspection and reflection on the concrete self. But with this aspect of the question we are not now concerned.

That the unity of the Self as an intelligent and moral being, that the Ego of self-consciousness was an ideal and a product of development, was what Herbart soon became convinced of. The unity of Self is even as given in mature experience an imperfect fact. It is a fact, that is, which does not come up to what it promised, and which requires to be supplemented, or

philosophically justified. Here and everywhere the custom of life carries us over gaps which yawn deep to the eye of philosophic reflection: even though accident and illness force them not unfrequently even upon the blindest. To trace the process of unification towards this unity — to trace, if you like, even the formation of the concept of such unity, as a governing and guiding principle in life and conduct, comes to be the problem of the psychologist, in the largest sense of that problem. From Soul (*Seele*) to Mind or Spirit (*Geist*) is for Herbart, as for Hegel, the course of psychology[27]. The growth and development of mind, the formation of a self, the realisation of a personality, is for both the theme which psychology has to expound. And Herbart, not less than Hegel, had to bear the censure that such a conception of mental reality as a growth would destroy personality[28].

But with so much common in the general plan, the two thinkers differ profoundly in their special mode of carrying out the task. Or, rather, they turn their strength on different departments of the whole. Herbart's great practical interest had been the theory of education: "paedagogic" is the subject of his first important writings. The inner history of ideas — the processes which are based on the interaction of elements in the individual soul — are what he specially traces. Hegel's interests, on the contrary, are more towards the greater process, the unities of historical life, and the correlations of the powers of art, religion, and philosophy that work therein. He turns to the macrocosm, almost as naturally as Herbart does to the microcosm. Thus, even in Ethics, while Herbart gives a delicate analysis of the distinct aspects or elements in the Ethical idea, — the diverse headings under which the disinterested spectator within the breast measures with purely aesthetic eye his approach to unity and strength of purpose, Hegel seems to hurry away from the field of moral sense or conscience to throw himself on the social and political organisation of the moral life. The

General Paedagogic of Herbart has its pendant in Hegel's Philosophy of Law and of History.

At an early period Herbart had become impressed with the necessity of applying mathematics to psychology[29]. To the usual objection, that psychical facts do not admit of measurement, he had a ready reply. We can calculate even on hypothetical assumptions: indeed, could we measure, we should scarcely take the trouble to calculate[30]. To calculate (i.e. to deduce mathematically) is to perform a general experiment, and to perform it in the medium where there is least likelihood of error or disturbance. There may be anomalies enough apparent in the mental life: there may be the great anomalies of Genius and of Freedom of Will; but the Newton and the Kepler of psychology will show by calculation on assumed conditions of psychic nature that these aberrations can be explained by mechanical laws. "The human Soul is no puppet-theatre: our wishes and resolutions are no marionettes: no juggler stands behind; but our true and proper life lies in our volition, and this life has its rule not outside, but in itself: it has its own purely mental rule, by no means borrowed from the material world. But this rule is in it sure and fixed; and on account of this its fixed quality it has more similarity to (what is otherwise heterogeneous) the laws of impact and pressure than to the marvels of an alleged inexplicable freedom[31]."

Psychology then deals with a real, which exhibits phenomena analogous in several respects to those discussed by statics and mechanics. Its foundation is a statics and mechanics of the Soul, — as this real is called. We begin by presupposing as the ultimate reality, underlying the factitious and generally imperfect unity of self-consciousness and mind, an essential and primary unity — the unity of an absolutely simple or individual point of being — a real point which amongst other points asserts itself, maintains itself. It has a character of its own, but that character it only shows in and through a development conditioned by external influences. The specific

nature of the soul-reality is to be representative, to produce, or manifest itself in, ideas (*Vorstellungen*). But the character only emerges into actuality in the conflict of the soul-atom with other ultimate realities in the congregation of things. A soul *per se* or isolated is not possessed of ideas. It is merely blank, undeveloped, formal unity, of which nothing can be said. But like other realities it defines and characterises itself by antithesis, by resistance: it shows what it is by its behaviour in the struggle for existence. It acts in self-defence: and its peculiar style or weapon of self-defence is an idea or representation. The way the Soul maintains itself is by turning the assailant into an idea[32]: and each idea is therefore a *Selbsterhaltung* of the Soul. The Soul is thus enriched — to appearance or incidentally: and the assailant is annexed. In this way the one Soul may develop or evolve or express an innumerable variety of ideas: for in response to whatever it meets, the living and active Soul ideates, or gives rise to a representation. Thus, while the soul is one, its ideas or representations are many. Taken separately, they each express the psychic self-conservation. But brought in relation with each other, as so many acts or self-affirmations of the one soul, they behave as forces, and tend to thwart or check each other. It is as forces, as reciprocally arresting or fostering each other, that ideas are objects of science. When a representation is thus held in check, it is reduced to a mere endeavour or active tendency to represent. Thus there arises a distinction between representations proper, and those imperfect states or acts which are partly or wholly held in abeyance. But the latent phase of an idea is as essential to a thorough understanding of it as what appears. It is the great blunder of empirical psychology to ignore what is sunk below the surface of consciousness. And to Herbart consciousness is not the condition but rather the product of ideas, which are primarily forces.

But representations are not merely in opposition, — impinging and resisting. The same reason which makes them resist, viz. that they are or

would fain be acts of the one soul, but are more or less incompatible, leads them in other circumstances to form combinations with each other. These combinations are of two sorts. They are, first, complications, or “complexions”: a number of ideas combine by quasi-addition and juxtaposition to form a total. Second, there is fusion: ideas presenting certain degrees of contrast enter into a union where the parts are no longer separately perceptible. It is easy to see how the problems of psychology now assume the form of a statics and mechanics of the mind. Quantitative data are to be sought in the strength of each separate single idea, and the degree in which two or more ideas block each other: in the degree of combination between ideas, and the number of ideas in a combination: and in the terms of relation between the members of a series of ideas. A statical theory has to show the conditions required for what we may call the ideal state of equilibrium of the “idea-forces”: to determine, that is, the ultimate degree of obscuration suffered by any two ideas of different strength, and the conditions of their permanent combination or fusion. A mechanics of the mind will, on the contrary, deal with the rate at which these processes are brought about, the velocity with which in the movement of mind ideas are obscured or reawakened, &c.

It is fortunately unnecessary, here, to go further into details. What Herbart proposes is not a method for the mathematical measurement of psychic facts: it is a theory of mechanics and statics specially adapted to the peculiarities of psychical phenomena, where the forces are given with no sine or cosine, where instead of gravitation we have the constant effort (as it were elasticity) of each idea to revert to its unchecked state. He claims — in short — practically to be a Kepler and Newton of the mind, and in so doing to justify the vague professions of more than one writer on mind — above all, perhaps of David Hume, who goes beyond mere professions — to make mental science follow the example of physics. And a main argument in

favour of his enterprise is the declaration of Kant that no body of knowledge can claim to be a science except in such proportion as it is mathematical. And the peculiarity of this enterprise is that self-consciousness, the Ego, is not allowed to interfere with the free play of psychic forces. The Ego is — psychologically — the result, the product, and the varying product of that play. The play of forces is no doubt a unity: but its unity lies not in the synthesis of consciousness, but in the essential unity of Soul. And Soul is in its essence neither consciousness, nor self-consciousness, nor mind: but something on the basis of whose unity these are built up and developed[33]. The mere "representation" does not include the further supervenience of consciousness: it represents, but it is not as yet necessary that we should also be conscious that there is representation. It is, in the phrase of Leibniz, perception: but not apperception. It is mere straight-out, not as yet reflected, representation. Gradually there emerges through the operation of mechanical psychics a nucleus, a floating unity, a fixed or definite central aggregate.

The suggestion of mathematical method has been taken up by subsequent inquirers (as it was pursued even before Herbart's time), but not in the sense he meant. Experimentation has now taken a prominent place in psychology. But in proportion as it has done so, psychology has lost its native character, and thrown itself into the arms of physiology. What Herbart calculated were actions and reactions of idea-forces: what the modern experimental school proposes to measure are to a large extent the velocities of certain physiological processes, the numerical specification of certain facts. Such ascertainments are unquestionably useful; as numerical precision is in other departments. But, taken in themselves, they do not carry us one bit further on the way to science. As experiments, further, — to note a point discussed elsewhere[34] — their value depends on the point of view, on the theory which has led to them, on the value of the general

scheme for which they are intended to provide a special new determination. In many cases they serve to give a vivid reality to what was veiled under a general phrase. The truth looks so much more real when it is put in figures: as the size of a huge tree when set against a rock; or as when Milton bodies out his fallen angel by setting forth the ratio between his spear and the tallest Norway pine. But until the general relationship between soul and body is more clearly formulated, such statistics will have but a value of curiosity.

(iii.) The Faculty-Psychology and its Critics.

What Herbart (as well as Hegel) finds perpetual ground for objecting to is the talk about mental faculties. This objection is part of a general characteristic of all the higher philosophy; and the recurrence of it gives an illustration of how hard it is for any class of men to see themselves as others see them. If there be anything the vulgar believe to be true of philosophy, it is that it deals in distant and abstruse generalities, that it neglects the shades of individuality and reality, and launches out into unsubstantial general ideas. But it would be easy to gather from the great thinkers an anthology of passages in which they hold it forth as the great work of philosophy to rescue our conceptions from the indefiniteness and generality of popular conception, and to give them real, as opposed to a merely nominal, individuality.

The Wolffian school, which Herbart (not less than Kant) found in possession of the field, and which in Germany may be taken to represent only a slight variant of the half-and-half attitude of vulgar thought, was entrenched in the psychology of faculties. Empirical psychology, said Wolff[35], tells the number and character of the soul's faculties: rational psychology will tell what they "properly" are, and how they subsist in soul. It is assumed that there are general receptacles or tendencies of mental

operation which in course of time get filled or qualified in a certain way: and that when this question is disposed of, it still remains to fix on the metaphysical bases of these facts.

That a doctrine of faculties should fix itself in psychology is not so wonderful. In the non-psychical world objects are easily discriminated in space, and the individual thing lasts through a time. But a phase of mind is as such fleeting and indeterminate: its individual features which come from its "object" tend soon to vanish in memory: all freshness of definite characters wears off, and there is left behind only a vague "recept" of the one and same in many, a sort of hypostatised representative, faint but persistent, of what in experience was an ever-varying succession. We generalise here as elsewhere: but elsewhere the many singulars remain to confront us more effectually. But in Mind the immense variety of real imagination, memory, judgment is forgotten, and the name in each case reduced to a meagre abstract. Thus the identity in character and operation, having been cut off from the changing elements in its real action, is transmuted into a substantial somewhat, a subsistent faculty. The relationship of one to another of the powers thus by abstraction and fancy created becomes a problem of considerable moment, their causal relations in particular: till in the end they stand outside and independent of each other, engaged, as Herbart says, in a veritable *bellum omnium contra omnes*.

But this hypostatising of faculties becomes a source of still further difficulties when it is taken in connexion with the hypostasis of the Soul or Self or Ego. To Aristotle the Soul in its general aspect is Energy or Essence; and its individual phases are energies. But in the hands of the untrained these conceptions came to be considerably displaced. Essence or Substance came to be understood (as may be seen in Locke, and still more in loose talk) as a something, — a substratum, — or peculiar nature — (of which *in*

itself nothing further could be said[36] but which notwithstanding was permanent and perhaps imperishable): this something subsistent exhibited certain properties or activities. There thus arose, on one hand, the Soul-thing, — a substance misunderstood and sensualised with a supernatural sensuousness, — a denizen of the transcendental or even of the transcendent world: and, on the other hand, stood the actual manifestations, the several exhibitions of this force, the assignable and describable psychic facts. We are accordingly brought before the problem of how this one substance or essence stands to the several entities or hypostases known as faculties. And we still have in the rear the further problem of how these abstract entities stand to the real and concrete single acts and states of soul and mind.

This hypostatising of faculties, and this distinction of the "Substantial" soul from its "accidentia" or phenomena, had grown — through the materialistic proclivities of popular conception — from the indications found in Aristotle. It attained its climax, perhaps in the Wolffian school in Germany, but it has been the resort of superficial psychology in all ages. For while it, on one hand, seemed to save the substantial Soul on whose incorruptibility great issues were believed to hinge, it held out, on the other, an open hand to the experimental inquirer, whom it bade freely to search amongst the phenomena. But if it was the refuge of pusillanimity, it was also the perpetual object of censure from all the greater and bolder spirits. Thus, the psychology of Hobbes may be hasty and crude, but it is at least animated by a belief that the mental life is continuous, and not cut off by abrupt divisions severing the mental faculties. The "image" (according to his materialistically coloured psychology) which, when it is a strong motion, is called sense, passes, as it becomes weaker or decays, into imagination, and gives rise, by its various complications and associations with others, to reminiscence, experience, expectation. Similarly, the voluntary motion which is an effect or a phase of imagination, beginning at

first in small motions — called by themselves “endeavours,” and in relation to their cause “appetites” or “desires[37]“ — leads on cumulatively to Will, which is the “last appetite in deliberating.” Spinoza, his contemporary, speaks in the same strain[38]. “Faculties of intellect, desire, love, &c., are either utterly fictitious, or nothing but metaphysical entities, or universals which we are in the habit of forming from particulars. Will and intellect are thus supposed to stand to this or that idea, this or that volition, in the same way as stoniness to this or that stone, or as man to Peter or Paul.” They are supposed to be a general something which gets defined and detached. But, in the mind, or in the cogitant soul, there are no such things. There are only ideas: and by an “idea” we are to understand not an image on the retina or in the brain, not a “dumb something, like a painting on a panel[39],” but a mode of thinking, or even the act of intellection itself. The ideas *are* the mind: mind does not *have* ideas. Further, every “idea,” as such, “involves affirmation or negation,” — is not an image, but an act of judgment — contains, as we should say, an implicit reference to actuality, — a reference which in volition is made explicit. Thus (concludes the corollary of Eth. ii. 49) “Will and Intellect are one and the same.” But in any case the “faculties” as such are no better than *entia rationis* (i.e. auxiliary modes of representing facts).

Leibniz speaks no less distinctly and sanely in this direction. “True powers are never mere possibilities: they are always tendency and action.” The “Monad” — that is the quasi-intelligent unit of existence, — is essentially activity, and its actions are perceptions and appetitions, i.e. tendencies to pass from one perceptive state or act to another. It is out of the variety, the complication, and relations of these miniature or little perceptions and appetitions, that the conspicuous phenomena of consciousness are to be explained, and not by supposing them due to one or other faculty. The soul is a unity, a self-developing unity, a unity which at

each stage of its existence shows itself in a perception or idea, — each such perception however being, to repeat the oft quoted phrase, *plein de l'avenir et chargé du passé*: — each, in other words, is not stationary, but active and urgent, a progressive force, as well as a representative element. Above all, Leibniz has the view that the soul gives rise to all its ideas from itself: that its life is its own production, not a mere inheritance of ideas which it has from birth and nature, nor a mere importation into an empty room from without, but a necessary result of its own constitution acting in necessary (predetermined) reciprocity and harmony with the rest of the universe.

But Hobbes, Spinoza, and Leibniz, were most attentively heard in the passages where they favoured or combatted the dominant social and theological prepossessions. Their glimpses of truer insight and even their palpable contributions in the line of a true psychology were ignored or forgotten. More attention, perhaps, was attracted by an attempt of a very different style. This was the system of Condillac, who, as Hegel says (p. 61), made an unmistakable attempt to show the necessary interconnexion of the several modes of mental activity. In his *Traité des Sensations* (1754), following on his *Essai sur l'origine des connaissances humaines* (1746), he tried to carry out systematically the deduction or derivation of all our ideas from sense, or to trace the filiation of all our faculties from sensation. Given a mind with no other power than sensibility, the problem is to show how it acquires all its other faculties. Let us then suppose a sentient animal to which is offered a single sensation, or one sensation standing out above the others. In such circumstances the sensation "becomes" (*devient*) attention: or a sensation "is" (*est*) attention, either because it is alone, or because it is more lively than all the rest. Again: before such a being, let us set two sensations: to perceive or feel (*apercevoir ou sentir*) the two sensations is the same thing (*c'est la même chose*). If one of the sensations is not present, but a sensation made already, then to perceive it is memory. Memory, then,

is only “transformed sensation” (*sensation transformée*). Further, suppose we attend to both ideas, this is “the same thing” as to compare them. And to compare them we must see difference or resemblance. This is judgment. “Thus sensation becomes successively attention, comparison, judgment.” And — by further steps of the equating process — it appears that sensation again “becomes” an act of reflection. And the same may be said of imagination and reasoning: all are transformed sensations.

If this is so with the intelligence, it is equally the case with the Will. To feel and not feel well or ill is impossible. Coupling then this feeling of pleasure or pain with the sensation and its transformations, we get the series of phases ranging from desire, to passion, hope, will. “Desire is only the action of the same faculties as are attributed to the understanding.” A lively desire is a passion: a desire, accompanied with a belief that nothing stands in its way, is a volition. But combine these affective with the intellectual processes already noticed, and you have thinking (*penser*)[40]. Thus thought in its entirety is, only and always, transformed sensation.

Something not unlike this, though scarcely so simply and directly doctrinaire, is familiar to us in some English psychology, notably James Mill’s[41]. Taken in their literal baldness, these identifications may sound strained, — or trifling. But if we look beyond the words, we can detect a genuine instinct for maintaining and displaying the unity and continuity of mental life through all its modifications, — coupled unfortunately with a bias sometimes in favour of reducing higher or more complex states of mind to a mere prolongation of lower and beggarly rudiments. But otherwise such analyses are useful as aids against the tendency of inert thought to take every name in this department as a distinguishable reality: the tendency to part will from thought — ideas from emotion — and even imagination from reason, as if either could be what it professed without the other.

(iv.) Methods and Problems of Psychology.

The difficulties of modern psychology perhaps lie in other directions, but they are not less worth guarding against. They proceed mainly from failure or inability to grasp the central problem of psychology, and a disposition to let the pen (if it be a book on the subject) wander freely through the almost illimitable range of instance, illustration, and application. Though it is true that the proper study of mankind is man, it is hardly possible to say what might not be brought under this head. *Homo sum, nihil a me alienum puto*, it might be urged. Placed in a sort of middle ground between physiology (summing up all the results of physical science) and general history (including the contributions of all the branches of sociology), the psychologist need not want for material. He can wander into ethics, aesthetic, and logic, into epistemology and metaphysics. And it cannot be said with any conviction that he is actually trespassing, so long as the ground remains so ill-fenced and vaguely enclosed. A desultory collection of observations on traits of character, anecdotes of mental events, mixed up with hypothetical descriptions of how a normal human being may be supposed to develop his so-called faculties, and including some dictionary-like verbal distinctions, may make a not uninteresting and possibly bulky work entitled Psychology.

It is partly a desire of keeping up to date which is responsible for the copious extracts or abstracts from treatises on the anatomy and functions of the nerve-system, which, accompanied perhaps by a diagram of the brain, often form the opening chapter of a work on psychology. Even if these researches had achieved a larger number of authenticated results than they as yet have, they would only form an appendix and an illustration to the proper subject[42]. As they stand, and so long as they remain largely hypothetical, the use of them in psychology only fosters the common delusion that, when we can picture out in material outlines a theory

otherwise unsupported, it has gained some further witness in its favour. It is quite arguable indeed that it may be useful to cut out a section from general human biology which should include the parts of it that were specially interesting in connexion with the expression or generation of thought, emotion, and desire. But in that case, there is a blunder in singling out the brain alone, and especially the organs of sense and voluntary motion, — except for the reason that this province of psycho-physics alone has been fairly mapped out. The preponderant half of the soul's life is linked to other parts of the physical system. Emotion and volition, and the general tone of the train of ideas, if they are to be connected with their expression and physical accompaniment (or aspect), would require a sketch of the heart and lungs, as well as the digestive system in general. Nor these alone. Nerve analysis (especially confined to the larger system), though most modern, is not alone important, as Plato and Aristotle well saw. So that if biology is to be adapted for psychological use (and if psychology deals with more than cognitive processes), a liberal amount of physiological information seems required.

Experimental psychology is a term used with a considerable laxity of content; and so too is that of physiological psychology, or psycho-physics. And the laxity mainly arises because there is an uncertainty as to what is principal and what secondary in the inquiry. Experiment is obviously a help to observation: and so far as the latter is practicable, the former would seem to have a chance of introduction. But in any case, experiment is only a means to an end and only practicable under the guidance of hypothesis and theory. Its main value would be in case the sphere of psychology were completely paralleled with one province of physiology. It was long ago maintained by Spinoza and (in a way by) Leibniz, that there is no mental phenomenon without its bodily equivalent, pendant, or correspondent. The *ordo rerum* (the molecular system of movements) is, he held, the same as

the order of ideas. But it is only at intervals, under special conditions, or when they reach a certain magnitude, that ideas emerge into full consciousness. As consciousness presents them, they are often discontinuous, and abrupt: and they do not always carry with them their own explanation. Hence if we are confined to the larger phenomena of consciousness alone, our science is imperfect: many things seem anomalous; above all, perhaps, will, attention, and the like. We have seen how Herbart (partly following the hints of Leibniz), attempted to get over this difficulty by the hypothesis of idea-forces which generate the forms and matter of consciousness by their mutual impact and resistance. Physiological psychology substitutes for Herbart's reals and his idea-forces a more materialistic sort of reality; perhaps functions of nerve-cells, or other analogous entities. There, it hopes one day to discover the underlying continuity of event which in the upper range of consciousness is often obscured, and then the process would be, as the phrase goes, explained: we should be able to picture it out without a gap.

These large hopes may have a certain fulfilment. They may lead to the withdrawal of some of the fictitious mental processes which are still described in works of psychology. But on the whole they can only have a negative and auxiliary value. The value, that is, of helping to confute feigned connexions and to suggest truer. They will be valid against the mode of thought which, when Psyché fails us for an explanation, turns to body, and interpolates soul between the states of body: the mode which, in an older phraseology, jumps from final causes to physical, and from physical (or efficient) to final. Here, as elsewhere, the physical has its place: and here, more than in many places, the physical has been unfairly treated. But the whole subject requires a discussion of the so-called "relations" of soul and body: a subject on which popular conceptions and so-called science are radically obscure.

“But the danger which threatens experimental psychology,” says Münsterberg, “is that, in investigating details, the connexion with questions of principle may be so lost sight of that the investigation finally lands at objects scientifically quite worthless[43]. Psychology forgets only too easily that all those numerical statistics which experiment allows us to form are only means for psychological analysis and interpretation, not ends in themselves. It piles up numbers and numbers, and fails to ask whether the results so formed have any theoretical value whatever: it seeks answers before a question has been clearly and distinctly framed; whereas the value of experimental answers always depends on the exactitude with which the question is put. Let me remind the reader, how one inquirer after another made many thousand experiments on the estimation of small intervals of time, without a single one of them raising the question what the precise point was which these experiments sought to measure, what was the psychological occurrence in the case, or what psychological phenomena were employed as the standard of time-intervals. And so each had his own arbitrary standard of measurement, each of them piled up mountains of numbers, each demonstrated that his predecessor was wrong; but neither Estel nor Mehner have carried the problem of the time-sense a single step further.

“This must be all changed, if we are not to drift into the barrenest scholastic.... Everywhere out of the correct perception that problems of principle demand the investigation of detailed phenomena, and that the latter investigation must proceed in comparative independence of the question of principles, there has grown the false belief that the description of detail phenomena is the ultimate aim of science. And so, side by side with details which are of importance to principles, we have others, utterly indifferent and theoretically worthless, treated with the same zeal. To the solution of their barren problems the old Schoolmen applied a certain

acuteness; but in order to turn out masses of numbers from barren experiments, all that is needed is a certain insensibility to fits of ennui. Let numbers be less collected for their own sake: and instead, let the problems be so brought to a point that the answers may possess the character of principles. Let each experiment be founded on far more theoretical considerations, then the number of the experiments may be largely diminished[44]."

What is thus said of a special group of inquiries by one of the foremost of the younger psychologists, is not without its bearings on all the departments in which psychology can learn. For physiological, or what is technically called psychological, experiment, is co-ordinate with many other sources of information. Much, for instance, is to be learnt by a careful study of language by those who combine sound linguistic knowledge with psychological training. It is in language, spoken and written, that we find at once the great instrument and the great document of the distinctively human progress from a mere *Psyche* to a mature *Nous*, from Soul to Mind. Whether we look at the varieties of its structure under different ethnological influences, or at the stages of its growth in a nation and an individual, we get light from language on the differentiation and consolidation of ideas. But here again it is easy to lose oneself in the world of etymology, or to be carried away into the enticing questions of real and ideal philology.

"The human being of the psychologist," says Herbart[45], "is the social and civilised human being who stands on the apex of the whole history through which his race has passed. In him is found visibly together all the multiplicity of elements, which, under the name of mental faculties, are regarded as a universal inheritance of humanity. Whether they are originally in conjunction, whether they are originally a multiplicity, is a point on which the facts are silent. The savage and the new-born child give us far less occasion to admire the range of their mind than do the nobler animals.

But the psychologists get out of this difficulty by the unwarranted assumption that all the higher mental activities exist potentially in children and savages — though not in the animals — as a rudimentary predisposition or psychical endowment. Of such a nascent intellect, a nascent reason, and nascent moral sense, they find recognisable traces in the scanty similarities which the behaviour of child or savage offers to those of civilised man. We cannot fail to note that in their descriptions they have before them a special state of man, and one which, far from accurately defined, merely follows the general impression made upon us by those beings we name civilised. An extremely fluctuating character inevitably marks this total impression. For there are no general facts: — the genuine psychological documents lie in the momentary states of individuals: and there is an immeasurably long way from these to the height of the universal concept of man in general."

And yet Man in general, — Man as man and therefore as mind — the concept of Man — normal and ideal man — the complete and adequate Idea of man — is the true terminus of the psychological process; and whatever be the difficulties in the way, it is the only proper goal of the science. Only it has to be built up, constructed, evolved, developed, — and not assumed as a datum of popular imagination. We want a concept, concrete and real, of Man and of Mind, which shall give its proper place to each of the elements that, in the several examples open to detailed observation, are presented with unfair or exaggerated prominence. The savage and the child are not to be left out as free from contributing to form the ideal: virtues here are not more important than vices, and are certainly not likely to be so informing: even the insane and the idiot show us what human intelligence is and requires: and the animals are also within the sweep of psychology. Man is not its theatre to the exclusion of woman; if it records the results of introspection of the Me, it will find vast and copious quarries in the various modes in which an individual identifies himself with

others as We. And even the social and civilised man gets his designation, as usual, *a potiori*. He is more civilised and social than others: perhaps rather more civilised than not. But always, in some measure, he is at the same time unsocial or anti-social, and uncivilised. Each unit in the society of civilisation has to the outside observer — and sometimes even to his own self-detached and impartial survey — a certain oddity or fixity, a gleam of irrationality, which shows him to fall short of complete sanity or limpid and mobile intelligence. He has not wholly put off the savage, — least of all, says the cynic, in his relations with the other sex. He carries with him even to the grave some grains of the recklessness and petulance of childhood. And rarely, if ever, can it be said of him that he has completely let the ape and tiger die.

But that is only one way of looking at the matter — and one which, perhaps, is more becoming to the pathologist and the cynic, than to the psychologist. Each of these stages of psychical development, even if that development be obviously describable as degeneration, has something which, duly adjusted, has its place and function in the theory of the normally-complete human mind. The animal, the savage, and the child, — each has its part there. It is a mutilated, one-sided and superficial advance in socialisation which cuts off the civilised creature from the natural stem of his ancestry, from the large freedom, the immense *insouciance*, the childlikeness of his first estate. There is something, again, wanting in the man who utterly lacks the individualising realism and tenderness of the woman, as in the woman who can show no comprehension of view or bravery of enterprise. Even pathological states of mind are not mere anomalies and mere degenerations. Nature perhaps knows no proper degenerations, but only by-ways and intricacies in the course of development. Still less is the vast enormity or irregularity of genius to be ignored. It is all — to the philosophic mind — a question of degree and

proportion, — though often the proportion seems to exceed the scale of our customary denominators. If an element is latent or quiescent (in arrest), that is no index to its absolute amount: "we know not what's resisted." Let us by all means keep proudly to our happy mediocrity of faculty, and step clear of insanity or idiotcy on one hand, and from genius or heroism on the other. But the careful observer will notwithstanding note how delicately graded and how intricately combined are the steps which connect extremes so terribly disparate. It is only vulgar ignorance which turns away in hostility or contempt from the imbecile and the deranged, and only a worse than vulgar sciolism which sees in genius and the hero nothing but an aberration from its much-prized average. Criminalistic anthropology, or the psychology of the criminal, may have indulged in much frantic exaggeration as to the doom which nature and heredity have pronounced over the fruit of the womb even before it entered the shores of light: yet they have at least served to discredit the free and easy assumption of the abstract averagist, and shown how little the penalties of an unbending law meet the requirements of social well-being.

Yet, if psychology be willing to learn in all these and other provinces of the estate of man, it must remember that, once it goes beyond the narrow range in which the interpretations of symbol and expression have become familiar, it is constantly liable to blunder in the inevitable effort to translate observation into theory. The happy mean between making too much of palpable differences and hurrying on to a similar rendering of similar signs is the rarest of gifts. Or, perhaps, it were truer to say it is the latest and most hardly won of acquirements. To learn to observe — observe with mind — is not a small thing. There are rules for it — both rules of general scope and, above all, rules in each special department. But like all "major premisses" in practice, everything depends on the power of judgment, the tact, the skill, the "gift" of applying them. They work not as mere rules to be conned by

rote, but as principles assimilated into constituents of the mental life-blood: rules which serve only as condensed reminders and hints of habits of thought and methods of research which have grown up in action and reflection. To observe we must comprehend: yet we can only comprehend by observing. We all know how unintelligible — save for epochs of ampler reciprocity, and it may be even of acquired unity of interest — the two sexes are for each other. Parents can remember how mysteriously minded they found their own elders; and in most cases they have to experience the depth of the gulf which in certain directions parts them from their children's hearts. Even in civilised Europe, the ordinary member of each nation has an underlying conviction (which at moments of passion or surprise will rise and find harsh utterance) that the foreigner is queer, irrational, and absurd. If the foreigner, further, be so far removed as a Chinaman (or an Australian "black"), there is hardly anything too vile, meaningless, or inhuman which the European will not readily believe in the case of one who, it may be, in turn describes him as a "foreign devil." It can only be in a fit of noble chivalry that the British rank and file can so far temporise with its insular prejudice as to admit of "Fuzzy-wuzzy" that

"He's a poor benighted 'eathen — but a first-class fightin' man."

Not every one is an observer who chooses to dub himself so, nor is it in a short lapse of time and with condescension for foreign habits, that any observer whatever can become a trustworthy reporter of the ideas some barbarian tribe holds concerning the things of earth and air, and the hidden things of spirits and gods. The "interviewer" no doubt is a useful being when it is necessary to find "copy," or when sharp-drawn characters and picturesque incidents are needed to stimulate an inert public, ever open to be interested in some new thing. But he is a poor contributor to the stored materials of science.

It is of other stuff that true science is made. And if even years of nominal intercourse and spatial juxtaposition sometimes leave human beings, as regards their inner selves, in the position of strangers still, what shall be said of the attempt to discern the psychic life of animals? Will the touch of curiosity which prompts us to watch the proceedings of the strange creatures, — will a course of experimentation on their behaviour under artificial conditions, — justify us in drawing liberal conclusions as to why they so behaved, and what they thought and felt about it? It is necessary in the first place to know what to observe, and how, and above all what for. But that presumed, we must further live with the animals not only as their masters and their examiners, but as their friends and fellow-creatures; we must be able — and so lightly that no effort is discernable — to lay aside the burden and garb of civilisation; we must possess that stamp of sympathy and similarity which invites confidence, and breaks down the reserve which our poor relations, whether human or others, offer to the first approaches of a strange superior. It is probable that in that case we should have less occasion to wonder at their oddities or to admire their sagacity. But a higher and more philosophical wonder might, as in other cases when we get inside the heart of our subject, take the place of the cheap and childish love of marvels, or of the vulgar straining after comic traits.

Of all this mass of materials the psychologist proper can directly make only a sparing use. Even as illustrations, his data must not be presented too often in all their crude and undigested individuality, or he runs the risk of leaving one-sided impressions. Every single instance, individualised and historical, — unless it be exhibited by that true art of genius which we cannot expect in the average psychologist — narrows, even though it be but slightly, the complete and all-sided truth. Anecdotes are good, and to the wise they convey a world of meaning, but to lesser minds they sometimes suggest anything but the points they should accentuate. Without the detail

of individual realistic study there is no psychology worth the name. History, story, we must have: but at the same time, with the philosopher, we must say, I don't give much weight to stories. And this is what will always — except in rare instances where something like genius is conjoined with it — make esoteric science hard and unpopular. It dare not — if it is true to its idea — rest on any amount of mere instances, as isolated, unreduced facts. Yet it can only have real power so far as it concentrates into itself the life-blood of many instances, and indeed extracts the pith and unity of all instances.

Nor, on the other hand, can it turn itself too directly and intently towards practical applications. All this theory of mental progress from the animate soul to the fullness of religion and science deals solely with the universal process of education: "the education of humanity" we may call it: the way in which mind is made true and real[46]. It is therefore a question of intricacy and of time how to carry over this general theory into the arena of education as artificially directed and planned. To try to do so at a single step would be to repeat the mistake of Plato, if Plato may be taken to suppose (which seems incredible) that a theoretical study of the dialectics of truth and goodness would enable his rulers, without the training of special experience, to undertake the supreme tasks of legislation or administration. All politics, like all education, rests on these principles of the means and conditions of mental growth: but the schooling of concrete life, though it may not develop the faculty of formulating general laws, will often train better for the management of the relative than a mere logical Scholastic in first or absolute principles.

In conclusion, there are one or two points which seem of cardinal importance for the progress of psychology. (1) Its difference from the physical sciences has to be set out: in other words, the peculiarity of psychical fact. It will not do merely to say that experience marks out these

boundaries with sufficient clearness. On the contrary, the terms consciousness, feeling, mind, &c., are evidently to many psychologists mere names. In particular, the habits of physical research when introduced into mental study lead to a good deal of what can only be called mythology. (2) There should be a clearer recognition of the problem of the relations of mental unity to mental elements. But to get that, a more thorough logical and metaphysical preparation is needed than is usually supposed necessary. The doctrine of identity and necessity, of universal and individual, has to be faced, however tedious. (3) The distinction between first-grade and second-grade elements and factors in the mental life has to be realised. The mere idea as presentative or immediate has to be kept clear of the more logico-reflective, or normative ideas, which belong to judgment and reasoning. And the number of these grades in mental development seems endless. (4) But, also, a separation is required — were it but temporary — between what may be called principles, and what is detail. At present, in psychology, "principles" is a word almost without meaning. A complete all-explaining system is of course impossible at present and may always be so. Yet if an effort of thought could be concentrated on cardinal issues, and less padding of conventional and traditional detail were foisted in, much might thereby be done to make detailed research fruitful. (5) And finally, perhaps, if psychology be a philosophical study, some hint as to its purpose and problem would be desirable. If it is only an abstract branch of science, of course, no such hint is in place.

Essay III. On Some Psychological Aspects Of Ethics.

ALLUSION HAS ALREADY been made to the question of the boundaries between logic and psychology, between logic and ethics, ethics and psychology, and psychology and epistemology. Each of these occasionally comes to cover ground that seems more appropriate to the others. Logic is sometimes restricted to denote the study of the conditions of derivative knowledge, of the canons of inference and the modes of proof. If taken more widely as the science of thought-form, it is supposed to imply a world of fixed or stereotyped relations between ideas, a system of stable thoughts governed by inflexible laws in an absolute order of immemorial or eternal truth. As against such fixity, psychology is supposed to deal with these same ideas as products — as growing out of a living process of thought — having a history behind them and perhaps a prospect of further change. The genesis so given may be either a mere chronicle-history, or it may be a philosophical development. In the former case, it would note the occasions of incident and circumstance, the reactions of mind and environment, under which the ideas were formed. Such a psychological genesis of several ideas is found in the Second Book of Locke's Essay. In the latter case, the account would be more concerned with the inner movement, the action and reaction in ideas themselves, considered not as due to casual occurrences, but as self-developing by an organic growth. But in either case, ideas would be shown not to be ready-made and independently existing kinds in a world of idea-things, and not to form an unchanging diagram or framework, but to be a growth, to have a history, and a development. Psychology in this sense would be a dynamical, as opposed to the supposed statical, treatment of ideas and concepts in logic. But it may be doubted how far it is well to call

this psychology: unless psychology deals with the contents of the mental life, in their meaning and purpose, instead of, as seems proper, merely in their character of psychic events. Such psychology is rather an evolutionist logic, — a dialectic process more than an analytic of a datum.

In the same way, ethics may be brought into one kind of contact with psychology. Ethics, like logic, may be supposed to presuppose and to deal with a certain inflexible scheme of requirements, a world of moral order governed by invariable or universal law; an eternal kingdom of right, existing independently of human wills, but to be learned and followed out in uncompromising obedience. As against this supposed absolute order, psychology may be said to show the genesis of the idea of obligation and duty, the growth of the authority of conscience, the formation of ideals, the relativity of moral ideas. Here also it may reach this conclusion, by a more external or a more internal mode of argument. It may try to show, in other words, that circumstances give rise to these forms of estimating conduct, or it may argue that they are a necessary development in the human being, constituted as he is. It may again be doubted whether this is properly called psychology. Yet its purport seems ultimately to be that the objective order is misconceived when it is regarded as an external or quasi-physical order: as a law written up and sanctioned with an external authority — as, in Kant's words, a heteronomy. If that order is objective, it is so because it is also in a sense subjective: if it is above the mere individuality of the individual, it is still in a way identical with his true or universal self-hood. Thus "psychological" here means the recognition that the logical and the moral law is an autonomy: that it is not given, but though necessary, necessary by the inward movement of the mind. The metaphor of law is, in brief, misleading. For, according to a common, though probably an erroneous, analysis of that term, the essence of a law in the political sphere is to be a species of command. And that is rather a one-sidedly practical or aesthetic

way of looking at it. The essence of law in general, and the precondition of every law in special, is rather uniformity and universality, self-consistency and absence of contradiction: or, in other words, rationality. Its essential opposite — or its contradiction in essence — is a privilege, an attempt at isolating a case from others. It need not indeed always require bare uniformity — require i.e. the same act to be done by different people: but it must always require that every thing within its operation shall be treated on principles of utter and thorough harmony and consistency. It requires each thing to be treated on public principles and with publicity: nothing apart and mere singular, as a mere incident or as a world by itself. Differently it may be treated, but always on grounds of common well-being, as part of an embracing system.

There is probably another sense, however, in which psychology comes into close relation with ethics. If we look on man as a microcosm, his inner system will more or less reproduce the system of the larger world. The older psychology used to distinguish an upper or superior order of faculties from a lower or inferior. Thus in the intellectual sphere, the intellect, judgment, and reason were set above the senses, imagination, and memory. Among the active powers, reasonable will, practical reason and conscience were ranked as paramount over the appetites and desires and emotions. And this use of the word "faculty" is as old as Plato, who regards science as a superior faculty to opinion or imagination. But this application — which seems a perfectly legitimate one — does not, in the first instance, belong to psychology at all. No doubt it is psychically presented: but it has an other source. It springs from an appreciation, a judgment of the comparative truth or reality of what the so-called psychical act means or expresses. Such faculties are powers in a hierarchy of means and ends and presuppose a normative or critical function which has classified reality. Psychically, the elements which enter into knowledge are not other than those which belong

to opinion: but they are nearer an adequate rendering of reality, they are truer, or nearer the Idea. And in the main we may say, that is truer or more real which succeeds in more completely organising and unifying elements — which rises more and more above the selfish or isolated part into the thorough unity of all parts.

The superior faculty is therefore the more thorough organisation of that which is elsewhere less harmoniously systematised. Opinion is fragmentary and partial: it begins abruptly and casually from the unknown, and runs off no less abruptly into the unknown. Knowledge, on the contrary, is unified: and its unity gives it its strength and superiority. The powers which thus exist are the subjective counterparts of objectively valuable products. Thus, reason is the subjective counterpart of a world in which all the constituents are harmonised and fall into due relationship. It is a product or result, which is not psychologically, but logically or morally important. It is a faculty, because it means that actually its possessor has ordered and systematised his life or his ideas of things. Psychologically, it, like unreason, is a compound of elements: but in the case of reason the composition is unendingly and infinitely consistent; it is knowledge completely unified. The distinction then is not in the strictest sense psychological: for it has an aesthetic or normative character; it is logical or ethical: it denotes that the idea or the act is an approach to truth or goodness. And so, when Butler or Plato distinguishes reason or reflection from appetites and affections, and even from self-love or from the heart which loves and hates, this is not exactly a psychological division in the narrower sense. That is to say: these are, in Plato's words, not merely "parts," but quite as much "kinds" and "forms" of soul. They denote degrees in that harmonisation of mind and soul which reproduces the permanent and complete truth of things. For example, self-love, as Butler describes it, has but a partial and narrowed view of the worth of acts: it is engrossing and self-involved: it cannot take

in the full dependence of the narrower interest on the larger and eternal self. So, in Plato, the man of heart is but a nature which by fits and starts, or with steady but limited vision, realises the larger life. These parts or kinds are not separate and co-existent faculties: but grades in the co-ordination and unification of the same one human nature.

(i.) Psychology and Epistemology.

Psychology however in the strict sense is extremely difficult to define. Those who describe it as the "science of mind," the "phenomenology of consciousness," seem to give it a wider scope than they really mean. The psychologist of the straiter sect tends, on the other hand, to carry us beyond mind and consciousness altogether. His, it has been said, is a psychology without a Psyché. For him Mind, Soul, and Consciousness are only current and convenient names to designate the field, the ground on which the phenomena he observes are supposed to transact themselves. But they must not on any account interfere with the operations; any more than Nature in general may interfere with strictly physical inquiries, or Life and vital force with the theories of biology. The so-called Mind is only to be regarded as a stage on which certain events represent themselves. In this field, or on this stage, there are certain relatively ultimate elements, variously called ideas, presentations, feelings, or states of consciousness. But these elements, though called ideas, must not be supposed more than mechanical or dynamical elements; consciousness is rather their product, a product which presupposes certain operations and relations between them. If we are to be strictly scientific, we must, it is urged, treat the factors of consciousness as not themselves conscious: we must regard them as quasi-objective, or in abstraction from the consciousness which surveys them. The Ego must sink

into a mere receptacle or arena of psychic event; its independent meaning or purport is to be ignored, as beside the question.

When this line is once fixed upon, it seems inevitable to go farther. Comte was inclined to treat psychology as falling between two stools: it must, he thought, draw all its content either from physiology on the one hand, or from social factors on the other. The dominant or experimental psychology of the present day seems inclined, without however formulating any very definite statement, to pronounce for the former alternative. It does not indeed adopt the materialistic view that mind is only a function of matter. Its standpoint rather is that the psychical presents itself even to unskilled observation as dependent on (i.e. not independent of) or as concomitant with certain physical or corporeal facts. It adds that the more accurately trained the observer becomes, the more he comes to discover a corporeal aspect even where originally he had not surmised its existence, and to conclude that the two cycles of psychical and physical event never interfere with each other: that soul does not intervene in bodily process, nor body take up and carry on psychical. If it is said that the will moves the limbs, he replies that the will which moves is really certain formerly unnoticed movements of nerve and muscle which are felt or interpreted as a discharge of power. If the ocular impression is said to cause an impression on the mind, he replies that any fact hidden under that phrase refers to a change in the molecules of the brain. He will therefore conclude that for the study of psychical phenomena the physical basis, as it may be called, is all important. Only so can observation really deal with fact capable of description and measurement. Thus psychology, it may be said, tends to become a department of physiology. From another standpoint, biology may be said to receive its completion in psychology. How much either phrase means, however, will depend on the estimate we form of biology. If biology is only the study of mechanical and chemical phenomena on the peculiar

field known as an organism, and if that organism is only treated as an environment which may be ignored, then psychology, put on the same level, is not the full science of mind, any more than the other is the full study of life. They both have narrowed their subject to suit the abstract scheme of the laboratory, where the victim of experiment is either altered by mutilation and artificial restrictions, or is dead. If, on the contrary, biology has a substantial unity of its own to which mechanical and chemical considerations are subordinate and instrumental, psychology may even take part with physiology without losing its essential rank. But in that case, we must, as Spinoza said[47], think less mechanically of the animal frame, and recognise (after the example of Schelling) something truly inward (i.e. not merely locally inside the skin) as the supreme phase or characteristic of life. We must, in short, recognise sensibility as the culmination of the physiological and the beginning of the psychological.

To the strictly scientific psychologist, as has been noted — or to the psychology which imitates optical and electrical science — ideas are only psychical events: they are not ideas *of* anything, relative, i.e. to something else; they have no meaning, and no reference to a reality beyond themselves. They are presentations; — not representations of something outside consciousness. They are appearances: but not appearances of something: they do not reveal anything beyond themselves. They are, we may almost say, a unique kind of physical phenomena. If we say they are presentations of something, we only mean that in the presented something, in the felt something, the wished something, we separate the quality or form or aspect of presentativeness, of feltness, of wishedness, and consider this aspect by itself. There are grades, relations, complications, of such presentations or in such presentedness: and with the description and explanation of these, psychology is concerned. They are fainter or stronger, more or less correlated and antithetical. Presentation (or ideation), in short,

is the name of a train of event, which has its peculiarities, its laws, its systems, its history.

All reality, it may be said, subsists in such presentation; it is for a consciousness, or in a consciousness. All *esse*, in its widest sense, is *percipi*. And yet, it seems but the commonest of experiences to say that all that is presented is not reality. It *is*, it has a sort of being, — is somehow presumed to exist: but it is not reality. And this reference and antithesis to *what* is presented is implied in all such terms as "ideas," "feelings," "states of consciousness": they are distinguished from and related to objects of sense or external facts, to something, as it is called, outside consciousness. Thoughts and ideas are set against things and realities. In their primitive stage both the child and the savage seem to recognise no such difference. What they imagine is, as we might say, on the same plane with what they touch and feel. They do not, as we reproachfully remark, recognise the difference between fact and fiction. All of us indeed are liable to lapses into the same condition. A strong passion, a keen hope or fear, as we say, invests its objects with reality: even a sanguine moment presents as fact what calmer reflection disallows as fancy. With natural and sane intelligences, however, the recrudescence of barbarous imagination is soon dispelled, and the difference between hallucinations and realities is established. With the utterly wrecked in mind, the reality of hallucinations becomes a permanent or habitual state. With the child and the untrained it is a recurrent and a disturbing influence: and it need hardly be added that the circle of these *decepti deceptores* — people with the "lie in the Soul" — is a large one. There thus emerges a distinction of vast importance, that of truth and falsehood, of reality and unreality, or between representation and reality. There arise two worlds, the world of ideas, and the world of reality which it is supposed to represent, and, in many cases, to represent badly.

With this distinction we are brought across the problem sometimes called Epistemological. Strictly speaking, it is really part of a larger problem: the problem of what — if Greek compounds must be used — may be styled Aletheiology — the theory of truth and reality: what Hegel called Logic, and what many others have called Metaphysics. As it is ordinarily taken up, "ideas" are believed to be something *in us* which is representative or symbolical of something truly real *outside us*. This inward something is said to be the first and immediate object of knowledge[48], and gives us — in a mysterious way we need not here discuss — the mediate knowledge of the reality, which is sometimes said to cause it. Ideas in the Mind, or in the Subject, or in us, bear witness to something outside the mind, — trans-subjective — beyond us. The Mind, Subject, or Ego, in this parallelism is evidently in some way identified with our corporeal organism: perhaps even located, and provided with a "seat," in some defined space of that organism. It is, however, the starting-point of the whole distinction that ideas *do not*, no less than they do, conform or correspond to this supra-conscious or extra-conscious world of real things. Truth or falsehood arises, according to these assumptions, according as psychical image or idea corresponds or not to physical fact. But how, unless by some miraculous second-sight, where the supreme consciousness, directly contemplating by intuition the true and independent reality, turns to compare with this immediate vision the results of the mediate processes conducted along the organs of sense, — how this agreement or disagreement of copy and original, of idea and reality, can be detected, it is impossible to say.

As has been already noted, the mischief lies in the hypostatisation of ideas as something existing in abstraction from things — and, of things, in abstraction from ideas. They are two abstractions, the first by the realist, the second by the idealist called subjective and psychological. To the realist, things exist by themselves, and they manage to produce a copy of

themselves (more or less exact, or symbolical) in *our* mind, i.e. in a materialistically-spiritual or a spiritualistically-material locus which holds "images" and ideas. To the psychological idealist, ideas have a substantive and primary right to existence, them alone do we really know, and from them we more or less legitimately are said (but probably no one takes this seriously) to infer or postulate a world of permanent things. Now ideas have no substantive existence as a sort of things, or even images of things anywhere. All this is pure mythology. It is said by comparative mythologists that in some cases the epithet or quality of some deity has been substantialised (hypostatised) into a separate god, who, however (so still to keep up the unity), is regarded as a relative, a son, or daughter, of the original. So the phrase "ideas of things" has been taken literally as if it was double. But to have an idea of a thing merely means that we know it, or think it. An idea is not given: it is a thing which is given in the idea. An idea is not an additional and intervening object of our knowledge or supposed knowledge. That a thing is our object of thought is another word for its being our idea, and that means we know it.

The distinction between truth and falsehood, between reality and appearance, is not arrived at by comparing what we have before us in our mind with some inaccessible reality beyond. It is a distinction that grows up with the growth and organisation of our presentations — with their gradual systematisation and unification in one consciousness. But this consciousness which thinks, i.e. judges and reasons, is something superior to the contrast of physical and psychical: superior, i.e. in so far as it includes and surveys the antithesis, without superseding it. It is the "transcendental unity of consciousness" of Kant — his synthetic unity of apperception. It means that all ideas ultimately derive their reality from their coherence with each other in an all-embracing or infinite idea. Real in a sense ideas always are, but with an imperfect reality. Thus the education to truth is not — such

a thing would be meaningless — ended by a rough and ready recommendation to compare our ideas with facts: it must teach the art which discovers facts. And the teaching may have to go through many grades or provinces: in each of which it is possible to acquire a certain virtuosoship without being necessarily an adept in another. It is through what is called the development of intellect, judgment, and reasoning that the faculty of truth-detecting or truth-selecting comes. And the common feature of all of these is, so to say, their superiority to the psychological mechanism, not in the sense of working without it and directly, but of being the organising unity or unifier and controller and judge of that mechanism. The certainty and necessity of truth and knowledge do not come from a constraint from the external thing which forces the inner idea into submission; they come from the inner necessity of conformity and coherence in the organism of experience. We in fact had better speak of ideas as experience — as felt reality: a reality however which has its degrees and perhaps even its provinces. All truth comes with the reasoned judgment, i.e. the syllogism — i.e. with the institution or discovery of relations of fact or element to fact or element, immediate or derivative, partial and less partial, up to its ideal coherence in one Idea. It is because this coherence is so imperfectly established in many human beings that their knowledge is so indistinguishable from opinion, and that they separate so loosely truth from error. They have not worked their way into a definitely articulated system, where there are no gaps, no abrupt transitions: their mental order is so loosely put together that divergences and contradictions which vex another drop off ineffectual from them.

(ii.) Kant, Fichte, and Hegel.

This was the idealism which Kant taught and Fichte promoted. Of the other idealism there are no doubt abundant traces in the language of Kant: and

they were greedily fastened on by Schopenhauer. To him the doctrine, that the world is my idea, is adequately represented when it is translated into the phrase that the world is a phantasmagoria of my brain; and escape from the subjective idealism thus initiated is found by him only through a supposed revelation of immediate being communicated in the experience of will. But according to the more consistently interpreted Kant, the problem of philosophy consists in laying bare the supreme law or conditions of consciousness on which depend the validity of our knowledge, our estimates of conduct, and our aesthetic standards. And these roots of reality are for Kant in the mind — or, should we rather say — in mind — in "Consciousness in General." In the *Criticism of Pure Reason* the general drift of his examination is to show that the great things or final realities which are popularly supposed to stand in self-subsistent being, as ultimate and all-comprehensive objects set up for knowledge, are not "things" as popularly supposed, but imperative and inevitable ideas. They are not objects to be known — (these are always finite): but rather the unification, the basis, or condition, and the completion of all knowledge. To know them — in the ordinary petty sense of knowledge — is as absurd and impossible as it would be, in the Platonic scheme of reality, to know the idea of good which is "on the further side of knowledge and being." God and the Soul — and the same would be true of the World (though modern speculators sometimes talk as if they had it at least within their grasp) — are not mere *objects* of knowledge. It would be truer to say they are that by which we know, and they are what in us knows: they make knowledge possible, and actual. Kant has sometimes spoken of them as the objects of a faith of reason. What he means is that reason only issues in knowledge because of and through this inevitable law of reason bidding us go on for ever in our search, because there can be nothing isolated and nowhere any *ne plus*

ultra in science, which is infinite and yet only justified as it postulates or commands unity.

Kant's central idea is that truth, beauty, goodness, are not dependent on some qualities of the object, but on the universal nature or law of consciousness. Beauty is not an attribute of things in their abstractness: but of things as ideas of a subject, and depends on the proportion and symmetry in the play of human faculty. Goodness is not conformity to an outward law, but is obligatory on us through that higher nature which is our truer being. Truth is not conformity of ideas with supposed trans-subjective things, but coherence and stability in the system of ideas. The really infinite world is not out there, but in here — in consciousness in general, which is the denial of all limitation, of all finality, of all isolation. God is the essential and inherent unity and unifier of spirit and nature — the surety that the world in all its differentiations is one. The Soul is not an essential entity, but the infinite fruitfulness and freshness of mental life, which forbids us stopping at anything short of complete continuity and unity. The Kingdom of God — the Soul — the moral law — is within us: within us, as supreme, supra-personal and infinite intelligences, even amid all our littleness and finitude. Even happiness which we stretch our arms after is not really beyond us, but is the essential self which indeed we can only reach in detail. It is so both in knowledge and in action. Each knowledge and enjoyment in reality is limited and partial, but it is made stable, and it gets a touch of infinitude, by the larger idea which it helps to realise. Only indeed in that antithesis between the finite and the infinite does the real live. Every piece of knowledge is real, only because it assumes *pro tempore* certain premisses which are given: every actual beauty is set in some defect of aesthetic completeness: every actually good deed has to get its foil in surrounding badness. The real is always partial and incomplete. But it has the basis or condition of its reality in an idea — in a transcendental unity of

consciousness, which is so to say a law, or a system and an order, which imposes upon it the condition of conformity and coherence; but a conformity which is essential and implicit in it.

Fichte has called his system a *Wissenschaftslehre* — a theory of knowledge. Modern German used the word *Wissenschaft*, as modern English uses the word Science, to denote the certified knowledge of piecemeal fact, the partial unification of elements still kept asunder. But by *Wissen*, as opposed to *Erkennen*, is meant the I know, am aware and sure, am in contact with reality, as opposed to the derivative and conditional reference of something to something else which explains it. The former is a wider term: it denotes all consciousness of objective truth, the certainty which claims to be necessary and universal, which pledges its whole self for its assertion. Fichte thus unifies and accentuates the common element in the Kantian criticisms. In the first of these Kant had begun by explaining the nature and limitation of empirical science. It was essentially conditioned by the given sensation — dependent i.e. on an unexplained and preliminary element. This is what makes it science in the strict or narrow sense of the term: its being set, as it were, in the unknown, the felt, the sense-datum. The side of reality is thus the side of limitation and of presupposition. But what makes it truth and knowledge in general, on the other hand, — as distinct from *a* truth (i.e. partial truth) and a knowledge, — is the ideal element — the mathematical, the logical, the rational law, — or in one word, the universal and formal character. So too every real action is on one hand the product of an impulse, a dark, merely given, immediate tendency to be, and without that would be nothing: but on the other hand it is only an intelligent and moral action in so far as it has its constitution from an intelligence, a formal system, which determine its place and function.

It is on the latter or ideal element that Kant makes the emphasis increasingly turn. Not truths, duties, beauties, but truth, duty, beauty, form

his theme. The formal element — the logical or epistemological condition of knowledge and morality and of beauty — is what he (and still more Fichte) considers the prime question of fundamental philosophy. His philosophy is an attempt to get at the organism of our fundamental belief — the construction, from the very base, of our conception of reality, of our primary certainty. In technical language, he describes our essential nature as a Subject-object. It is the unity of an I am which is also I know that I am: an I will which is also I am conscious of my will[49]. Here there is a radical disunion and a supersession of that disunion. Action and contemplation are continually outrunning each other. The I will rests upon one I know, and works up to another: the I know reflects upon an I will, and includes it as an element in its idea.

Kant had brought into use the term Deduction, and Fichte follows him. The term leads to some confusion: for in English, by its modern antithesis to induction, it suggests *a priori* methods in all their iniquity. It means a kind of jugglery which brings an endless series out of one small term. Kant has explained that he uses it in the lawyer's sense in which a claim is justified by being traced step by step back to some acknowledged and accepted right[50]. It is a regressive method which shows us that if the original datum is to be accepted it carries along with it the legitimation of the consequence. This method Fichte applies to psychology. Begin, he says like Condillac, with the barest nucleus of soul-life; the mere sentiency, or feeling: the contact, as it were, with being, at a single point. But such a mere point is unthinkable. You find, as Mr. Spencer says, that "Thought" (or Consciousness) "cannot be framed out of one term only." "Every sensation to be known as one must be perceived." Such is the nature of the Ego — a subject which insists on each part being qualified by the whole and so transformed. As Mr. Spencer, again, puts it, the mind not merely tends to revive, to associate, to assimilate, to represent its own

presentations, but it carries on this process infinitely and in ever higher multiples. Ideas as it were are growing in complexity by re-presenting: i.e. by embracing and enveloping elements which cannot be found existing in separation. In the mind there is no mere presentation, no bare sensation. Such a unit is a fiction or hypothesis we employ, like the atom, for purposes of explanation. The pure sensation therefore — which you admit because you must have something to begin with, not a mere nothing, but something so simple that it seems to stand out clear and indisputable — this pure sensation, when you think of it, forces you to go a good deal further. Even to be itself, it must be more than itself. It is like the pure or mere being of the logicians. Admit the simple sensation — and you have admitted everything which is required to make sensation a possible reality. But you do not — in the sense of vulgar logic — deduce what follows out of the beginning. From that, taken by itself, you will get only itself: mere being will give you only nothing, to the end of the chapter. But, as the phrase is, sensation is an element in a consciousness: it is, when you think of it, always more than you called it: there is a curious "continuity" about the phenomena, which makes real isolation impossible.

Of course this "deduction" is not history: it is logic. It says, if you posit sensation, then in doing so, you posit a good deal more. You have imagination, reason, and many more, all involved in your original assumption. And there is a further point to be noted. You cannot really stop even at reason, at intelligence and will, if you take these in the full sense. You must realise that these only exist as part and parcel of a reasonable world. An individual intelligence presupposes a society of intelligences. The successive steps in this argument are presented by Fichte in the chief works of his earlier period (1794-98). The works of that period form a kind of trilogy of philosophy, by which the faint outlines of the absolute selfhood is shown acquiring definite consistency in the moral organisation of society.

First comes the “Foundation for the collective philosophy.” It shows how our conception of reality and our psychical organisation are inevitably presupposed in the barest function of intelligence, in the abstractest forms of logical law. Begin where you like, with the most abstract and formal point of consciousness, you are forced, as you dwell upon it (you identifying yourself with the thought you realise), to go step by step on till you accept as a self-consistent and self-explanatory unity all that your cognitive and volitional nature claims to own as its birthright. Only in such an intelligent will is perception and sensation possible. Next came the “Foundation of Natural Law, on the principles of the general theory.” Here the process of deduction is carried a step further. If man is to realise himself as an intelligence with an inherent bent to action, then he must be conceived as a person among persons, as possessed of rights, as incapable of acting without at the same moment claiming for his acts recognition, generality, and logical consecution. The reference, which in the conception of a practical intelligence was implicit, — the reference to fellow-agents, to a world in which law rules — is thus, by the explicit recognition of these references, made a fact patent and positive — *gesetzt*, — expressly instituted in the way that the nature and condition of things postulates. But this is not all: we step from the formal and absolute into the material and relative. If man is to be a real intelligence, he must be an intelligence served by organs. “The rational being cannot realise its efficient individuality, unless it ascribes to itself a material body”: a body, moreover, in which Fichte believes he can show that the details of structure and organs are equally with the general corporeity predetermined by reason[51]. In the same way it is shown that the social and political organisation is required for the realisation — the making positive and yet coherent — of the rights of all individuals. You deduce society by showing it is required to make a genuine individual man. Thirdly came the “System of Ethics.” Here it is further

argued that, at least in a certain respect[52], in spite of my absolute reason and my absolute freedom, I can only be fully real as a part of Nature: that my reason is realised in a creature of appetite and impulse. From first to last this deduction is one process which may be said to have for its object to determine "the conditions of self-hood or egoity." It is the deduction of the concrete and empirical moral agent — the actual ego of actual life — from the abstract, unconditioned ego, which in order to be actual must condescend to be at once determining and determined.

In all of this Fichte makes — especially formally — a decided advance upon Kant. In Ethics Kant in particular, (— especially for readers who never got beyond the beginning of his moral treatise and were overpowered by the categorical imperative of duty) had found the moral initiative or dynamic apparently in the other world. The voice of duty seemed to speak from a region outside and beyond the individual conscience. In a sense it must do so: but it comes from a consciousness which is, and yet is more than, the individual. It is indeed true that appearances here are deceptive: and that the idea of autonomy, the self-legislation of reason, is trying to become the central conception of Kant's Ethics. Still it is Fichte's merit to have seen this clearly, to have held it in view unfalteringly, and to have carried it out in undeviating system or deduction. Man, intelligent, social, ethical, is a being all of one piece and to be explained entirely immanently, or from himself. Law and ethics are no accident either to sense or to intelligence — nothing imposed by mere external or supernal authority[53]. Society is not a brand-new order of things supervening upon and superseding a state of nature, where the individual was entirely self-supporting. Morals, law, society, are all necessary steps (necessary i.e. in logic, and hence in the long run also inevitable in course of time) to complete the full evolution or realisation of a human being. The same conditions as make man intelligent make him social and moral. He does not

proceed so far as to become intelligent and practical, under terms of natural and logical development, then to fall into the hands of a foreign influence, an accident *ab extra*, which causes him to become social and moral. Rather he is intelligent, because he is a social agent.

Hence, in Fichte, the absence of the ascetic element so often stamping its character on ethics, and representing the moral life as the enemy of the natural, or as mainly a struggle to subdue the sensibility and the flesh. With Kant, — as becomes his position of mere inquirer — the sensibility has the place of a predominant and permanent foreground. Reason, to his way of talking, is always something of an intruder, a stranger from a far-off world, to be feared even when obeyed: sublime, rather than beautiful. From the land of sense which we habitually occupy, the land of reason is a country we can only behold from afar: or if we can be said to have a standpoint in it, that is only a figurative way of saying that though it is really over the border, we can act — it would sometimes seem by a sort of make-believe — as if we were already there. But these moments of high enthusiasm are rare; and Kant commends sobriety and warns against high-minded *Schwärmerei*, or over-strained Mysticism. For us it is reserved to struggle with a recalcitrant selfhood, a grovelling sensibility: it were only fantastic extravagance, fit for "fair souls" who unfortunately often lapse into "fair sinners," should we fancy ourselves already anchored in the haven of untempted rest and peace.

When we come to Fichte, we find another spirit breathing. We have passed from the age of Frederick the Great to the age of the French Revolution; and the breeze that burst in the War of Liberation is already beginning to freshen the air. Boldly he pronounces the primacy of that faith of reason whereby not merely the just but all shall live. Your will shall show you what you really are. You are essentially a rational will, or a will-reason. Your sensuous nature, of impulse and appetite, far from being the given and

found obstacle to the realisation of reason, — which Kant strictly interpreted might sometimes seem to imply — (and in this point Schopenhauer carries out the implications of Kant) — is really the condition or mode of being which reason assumes, or rises up to, in order to be a practical or moral being. Far from the body and the sensible needs being a stumbling-block to hamper the free fullness of rationality and morality, the truth rather is that it is only by body and sense, by flesh and blood, that the full moral and rational life can be realised[54]. Or, to put it otherwise, if human reason (intelligence and will) is to be more than a mere and empty inner possibility, if man is to be a real and concrete cognitive and volitional being, he must be a member of an ethical and actual society, which lives by bread, and which marries and has children.

(iii.) Psychology in Ethics.

In this way, for Fichte, and through Fichte still more decidedly for Hegel, both psychology and ethics breathe an opener and ampler air than they often enjoy. Psychology ceases to be a mere description of psychic events, and becomes the history of the self-organising process of human reason. Ethics loses its cloistered, negative, unnatural aspect, and becomes a name for some further conditions of the same development, essentially postulated to complete or supplement its shortcomings. Psychology — taken in this high philosophical acceptation — thus leads on to Ethics; and Ethics is parted by no impassable line from Psychology. That, at least, is what must happen if they are still to retain a place in philosophy: for, as Kant says[55], "under the government of reason our cognitions cannot form a rhapsody, but must constitute a system, in which alone can they support and further its essential aims." As parts of such a system, they carry out their special work in subordination to, and in the realisation of, a single Idea — and therefore in essential interconnexion. From that interconnecting band we may

however in detail-enquiry dispense ourselves; and then we have the empirical or inductive sciences of psychology and ethics. But even with these, the necessity of the situation is such that it is only a question of degree how far we lose sight of the philosophical horizon, and entrench ourselves in special enquiry. Something of the philosophic largeness must always guide us; even when, to further the interests of the whole, it is necessary for the special enquirer to bury himself entirely in his part. So long as each part is sincerely and thoroughly pursued, and no part is neglected, there is an indwelling reason in the parts which will in the long run tend to constitute the total.

A philosophical psychology will show us how the sane intelligence and the rational will are, at least approximately, built up out of elements, and through stages and processes, which modify and complement, as they may also arrest and perplex, each other. The unity, coherence, and completeness of the intelligent self is not, as vulgar irreflectiveness supposes and somewhat angrily maintains, a full-grown thing or agent, of whose actions and modes of behaviour the psychologist has to narrate the history, — a history which is too apt to degenerate into the anecdotal and the merely interesting. This unity of self has to be "deduced," as Fichte would say: it has to be shown as the necessary result which certain elements in a certain order will lead to[56]. A normal mind, self-possessed, developed and articulated, yet thoroughly one, a real microcosm, or true and full monad, which under the mode of its individuality still represents the universe: that is, what psychology has to show as the product of factors and processes. And it is clearly something great and good, something valuable, and already possessing, by implication we may say, an ethical character.

In philosophy, at least, it is difficult, or rather impossible to draw a hard and fast line which shall demarcate ethical from non-ethical characters, — to separate them from other intellectual and reasonable motives. Kant, as

we know, attempted to do so: but with the result that he was forced to add a doubt whether a purely moral act could ever be said to exist[57]; or rather to express the certainty that if it did it was for ever inaccessible to observation. All such designations of the several "factors" or "moments" in reality, as has been hinted, are only *a potiori*. But they are misused when it is supposed that they connote abrupt and total discontinuity. And Kant, after all, only repeated in his own terminology an old and inveterate habit of thought: — the habit which in Stoicism seemed to see sage and foolish utterly separated, and which in the straiter sects of Christendom fenced off saint absolutely from sinner. It is a habit to which Hegel, and even his immediate predecessors, are radically opposed. With Herder, he might say, "Ethics is only a higher physics of the mind[58]." This — the truth in Spinozism — no doubt demands some emphasis on the word "higher": and it requires us to read ethics (or something like it) into physics; but it is a step on the right road, — the step which Utilitarianism and Evolutionism had (however awkwardly) got their foot upon, and which "transcendent" ethics seems unduly afraid of committing itself to. Let us say, if we like, that the mind is more than mere nature, and that it is no proper object of a merely natural science. But let us remember that a merely natural science is only a fragment of science: let us add that the *merely* natural is an abstraction which in part denaturalises and mutilates the larger nature — a nature which includes the natural mind, and cannot altogether exclude the ethical.

What have been called "formal duties[59]" seem to fall under this range — the province of a philosophical psychology which unveils the conditions of personality. Under that heading may be put self-control, consistency, resolution, energy, forethought, prudence, and the like. The due proportion of faculty, the correspondence of head and heart, the vivacity and quickness of sympathy, the ease and simplicity of mental tone, the due vigour of

memory and the grace of imagination, sweetness of temper, and the like, are parts of the same group[60]. They are lovely, and of good report: they are praise and virtue. If it be urged that they are only natural gifts and graces, that objection cuts two ways. The objector may of course be reminded that religion tones down the self-complacency of morality. Yet, first, even apart from that, it may be said that of virtues, which stand independent of natural conditions — of external supply of means (as Aristotle would say) — nothing can be known and nothing need be said. And secondly, none of these qualities are mere gifts; — all require exercise, habituation, energising, to get and keep them. How much and how little in each case is nature's and how much ours is a problem which has some personal interest — due perhaps to a rather selfish and envious curiosity. But on the broad field of experience and history we may perhaps accept the — apparently one-sided — proverb that "Each man is the architect of his own fortune." Be this as it may, it will not do to deny the ethical character of these "formal duties" on the ground e.g. that self-control, prudence, and even sweetness of temper may be used for evil ends, — that one may smile and smile, and yet be a villain. That — let us reply, — on one hand, is a fault (if fault it be) incidental to all virtues in detail (for every single quality has its defect): nay it may be a limitation attaching to the whole ethical sphere: and, secondly, its inevitable limitation does not render the virtue in any case one whit less genuine so far as it goes. And yet of such virtues it may be said, as Hume[61] would say (who calls them "natural," as opposed to the more artificial merits of justice and its kin), that they please in themselves, or in the mere contemplation, and without any regard to their social effects. But they please as entering into our idea of complete human nature, of mind and spirit as will and intellect.

The moralists of last century sometimes divided the field of ethics by assigning to man three grades or kinds of duty: duties to himself, duties to

society, and duties to God. For the distinction there is a good deal to be said: there are also faults to be found with it. It may be said, amongst other things, that to speak of duties to self is a metaphorical way of talking, and that God lies out of the range of human duty altogether, except in so far as religious service forms a part of social obligation. It may be urged that man is essentially a social being, and that it is only in his relations to other such beings that his morality can find a sphere. The sphere of morality, according to Dr. Bain, embraces whatever "society has seen fit to enforce with all the rigour of positive inflictions. Positive good deeds and self-sacrifice ... transcend the region of morality proper and occupy a sphere of their own[62]." And there is little doubt that this restriction is in accordance with a main current of usage. It may even be said that there are tendencies towards a narrower usage still, which would restrict the term to questions affecting the relations of the sexes. But, without going so far, we may accept the standpoint which finds in the phrase "popular or social" sanction, as equivalent to the moral sanction, a description of the average level of common opinion on the topic. The morality of an age or country thus denotes, first, the average requirement in act and behaviour imposed by general consent on the members of a community, and secondly, the average performance of the members in response to these requirements. Generally speaking the two will be pretty much the same. If the society is in a state of equilibrium, there will be a palpable agreement between what all severally expect and what all severally perform. On the other hand, as no society is ever in complete equilibrium, this harmony will never be perfect and may often be widely departed from. In what is called a single community, if it reach a considerable bulk, there are (in other words) often a number of minor societies, more or less thwarting and modifying each other; and different observers, who belong in the main to one or other of these subordinate groups, may elicit from the facts before them a somewhat

different social code, and a different grade of social observance. Still, with whatever diversity of detail, the important feature of such social ethics is that the stress is laid on the performance of certain acts, in accordance with the organisation of society. So long as the required compliance is given, public opinion is satisfied, and morality has got its due.

But in two directions this conception of morality needs to be supplementing. There is, on one hand, what is called duty to God. The phrase is not altogether appropriate: for it follows too closely the analogy of social requirement, and treats Deity as an additional and social authority, — a lord paramount over merely human sovereigns. But though there may be some use in the analogy, to press the conception is seriously to narrow the divine character and the scope of religion. As in similar cases, we cannot change one term without altering its correlative. And therefore to describe our relation to God under the name of duty is to narrow and falsify that relation. The word is no longer applicable in this connexion without a strain, and where it exists it indicates the survival of a conception of theocracy: of God regarded as a glorification of the magistrate, as king of kings and lord of lords. It is the social world — and indeed we may say the outside of the social world — that is the sphere of duties. Duty is still with these reductions a great august name: but in literal strictness it only rules over the medial sphere of life, the sphere which lies between the individual as such and his universal humanity[63]. Beyond duty, lies the sphere of conscience and of religion. And that is not the mere insistence by the individual to have a voice and a vote in determining the social order. It is the sense that the social order, however omnipotent it may seem, is limited and finite, and that man has in him a kindred with the Eternal.

It is not very satisfactory, either, as Aristotle and others have pointed out, to speak of man's duties to himself. The phrase is analogical, like the other. But it has the merit, like that of duty to God, of reminding us that the

ordinary latitude occupied by morality is not all that comes under the larger scope of ethics. The "ethics of individual life" is a subject which Mr. Spencer has touched upon: and by this title, he means that, besides his general relationship to others, a human being has to mind his own health, food, and amusement, and has duties as husband and parent. But, after all, these are not matters of peculiarly individual interest. They rather refer to points which society at certain epochs leaves to the common sense of the agent, — apparently on an assumption that he is the person chiefly interested. And these points — as the Greeks taught long ago — are of fundamental importance: they are the very bases of life. Yet the comparative neglect in which so-called civilised societies[64] hold the precepts of wisdom in relation to bodily health and vigour, in regard to marriage and progeny, serve to illustrate the doctrine of the ancient Stoics that πάντα ὑπόληψις, or the modern idealist utterance that the World is my idea. More and more as civilisation succeeds in its disruption of man from nature, it shows him governed not by bare facts and isolated experiences, but by the systematic idea under which all things are subsumed. He loses the naïveté of the natural man, which takes each fact as it came, all alike good: he becomes sentimental, and artificial, sees things under a conventional point of view, and would rather die than not be in the fashion. And this tendency is apparently irresistible. Yet the mistake lies in the one-sidedness of sentiment and convention. Not the domination of the idea is evil; but the domination of a partial and fragmentary idea: and this is what constitutes the evil of artificiality. And the correction must lie not in a return to nature, but in the reconstruction of a wider and more comprehensive idea: an idea which shall be the unity and system of all nature; not a fantastic idealism, but an attempt to do justice to the more realist as well as the idealist sides of life.

There is however another side of individualist ethics which needs even more especial enforcement. It is the formation of

"The reason firm, the temperate will,

Endurance, foresight, strength and skill:"

the healthy mind in a healthy body. Ethics is only too apt to suppose that will and intelligence are assumptions which need no special justification. But the truth is that they vary from individual to individual in degree and structure. It is the business of ethical psychology to give to these vague attributions the definiteness of a normal standard: to show what proportions are required to justify the proper title of reason and will — to show what reason and will really are if they do what they are encouraged or expected to do. It talks of the diseases of will and personality: it must also set forth their educational ideal. The first problem of Ethics, it may be said, is the question of the will and its freedom. But to say this is of course not to say that, unless freedom of will be understood in some special sense, ethics becomes impossible. If the moral law is the *ratio cognoscendi* of freedom, then must our conception of morality and of freedom hang together. And it will clearly be indispensable to begin by some attempt to discover in what sense man may be in the most general way described as a moral agent — as an intelligent will, or (more briefly, yet synonymously) as a will. "The soil of law and morality," says Hegel[65], "is the intelligent life: and its more precise place and starting-point the will, which is free, in the sense that freedom is its substance and characteristic, and the system of law the realm of freedom realised, the world of intelligence produced out of itself as a second nature." Such a freedom is a freedom made and acquired, the work of the mind's self-realisation, not to be taken as a given fact of consciousness which must be believed[66]. To have a will — in other words, to have freedom, is the consummation — and let us add, only the formal or ideal consummation — of a process by which man raises himself out of his

absorption in sensation and impulse, establishes within himself a mental realm, an organism of ideas, a self-consciousness, and a self.

The vulgar apprehension of these things seems to assume that we have by nature, or are born with, a general faculty or set of general faculties, which we subsequently fill up and embody by the aid of experience. We possess — they seem to imply — so many “forms” and “categories” latent in our minds ready to hold and contain the raw materials supplied from without. According to this view we have all a will and an intelligence: the difference only is that some put more into them, and some put less. But such a separation of the general form from its contents is a piece of pure mythology. It is perhaps true and safe to say that the human being is of such a character that will and intelligence are in the ordinary course inevitably produced. But the forms which grow up are the more and more definite and systematic organisation of a graded experience, of series of ideas, working themselves up again and again in representative and re-representative degree, till they constitute a mental or inner world of their own. The will is thus the title appropriate to the final stage of a process, by which sensation and impulse have polished and perfected themselves by union and opposition, by differentiation and accompanying redintegration, till they assume characters quite unsurmised in their earliest aspects, and yet only the consolidation or self-realisation of implications. Thus the mental faculties are essentially acquired powers, — acquired not from without, but by action which generates the faculties it seems to imply. The process of mind is a process which creates individual centres, raises them to completer independence; — which produces an inner life more and more self-centered and also more and more equal to the universe which it has embodied. And will and intelligence are an important stage in that process.

Herbart (as was briefly hinted at in the first essay) has analysed ethical appreciation (which may or may not be accompanied by approbation) into five distinct standard ideas. These are the ideas of inward liberty, of perfection, of right, benevolence, and equity. Like Hume, he regards the moral judgment as in its purity a kind of aesthetic pronouncement on the agreement or proportion of certain activities in relations to each other. Two of these standard ideas, — that of inward liberty and of perfection — seem to belong to the sphere at present under review. They emerge as conditions determining the normal development of human nature to an intelligent and matured personality. By inward freedom Herbart means the harmony between the will and the intellect: what Aristotle has named "practical truth or reality," and what he describes in his conception of wisdom or moral intelligence, — the power of discerning the right path and of pursuing it with will and temper: the unity, clear but indissoluble, of will and discernment. By the idea of perfection Herbart means the sense of proportion and of propriety which is awakened by comparing a progress in development or an increase in strength with its earlier stages of promise and imperfection. The pleasure such perception affords works in two ways: it is a satisfaction in achievement past, and a stimulus to achievement yet to come.

Such ideas of inward liberty and of growth in ability or in performance govern (at least in part) our judgment of the individual, and have an ethical significance. Indeed, if the cardinal feature of the ethical sentiment be the inwardness and independence of its approbation and obligation, these ideas lie at the root of all true morality. Inward harmony and inward progress, lucidity of conscience and the resolution which knows no finality of effort, are the very essence of moral life. Yet, if ethics is to include in the first instance social relationships and external utilities and sanctions, these conditions of true life must rather be described as pre-ethical. The truth

seems to be that here we get to a range of ethics which is far wider than what is ordinarily called practice and conduct. At this stage logic, aesthetic, and ethic, are yet one: the true, the good, and the beautiful are still held in their fundamental unity. An ethics of wide principle precedes its narrower social application; and whereas in ordinary usage the social provinciality is allowed to prevail, here the higher ethics emerge clear and imperial above the limitations of local and temporal duty.

And though it is easy to step into exaggeration, it is still well to emphasise this larger conception of ethics. The moral principle of the "maximising of life," as it has been called[67], may be open to misconception (— so, unfortunately are all moral principles when stated in the effrontery of isolation): but it has its truth in the conviction that all moral evil is marked by a tendency to lower or lessen the total vitality. So too Friedrich Nietzsche's maxim, *Sei vornehm*[68], ensue distinction, and above all things be not common or vulgar (*gemein*), will easily lend itself to distortion. But it is good advice for all that, even though it may be difficult to define in a general formula wherein distinction consists, to mark the boundary between self-respect and vanity or obstinacy, or to say wherein lies the beauty and dignity of human nature. Kant has laid it down as the principle of duty to ask ourselves if in our act we are prepared to universalise the maxim implied by our conduct. And that this — which essentially bids us look at an act in the whole of its relations and context — is a safeguard against some forms of moral evil, is certain. But there is an opposite — or rather an apparently opposite — principle which bids us be individual, be true to our own selves, and never allow ourselves to be dismayed from our own unique responsibility. Perhaps the two principles are not so far apart as they seem. In any case true individuality is the last word and the first word in ethics; though, it may be added, there is a good deal to be said between the two termini.

(iv.) An Excursus on Greek Ethics.

It is in these regions that Greek ethics loves to linger; on the duty of the individual to himself, to be perfectly lucid and true, and to rise to ever higher heights of achievement. *Ceteris paribus*, there is felt to be something meritorious in superiority, something good: — even were it that you are master, and another is slave. Thus naïvely speaks Aristotle[69]. To a modern, set amid so many conflicting ideals, perhaps, the immense possibilities of yet further growth might suggest themselves with overpowering force. To him the idea of perfection takes the form of an idea of perfectibility: and sometimes it smites down his conceit in what he has actually done, and impresses a sense of humility in comparison with what yet remains unaccomplished. An ancient Greek apparently was little haunted by these vistas of possibilities of progress through worlds beyond worlds. A comparatively simple environment, a fixed and definite mental horizon, had its plain and definite standards, or at least seemed to have such. There were fewer cases of the man, unattached or faintly attached to any definite profession — moving about in worlds half realised — who has grown so common in a more developed civilisation. The ideals of the Greek were clearly descried: each man had his definite function or work to perform: and to do it better than the average, or than he himself habitually had done, that was perfection, excellence, virtue. For virtue to the Greek is essentially ability and respectability: promise of excellent performance: capacity to do better than others. Virtue is praiseworthy or meritorious character and quality: it is achievement at a higher rate, as set against one's past and against others' average.

The Greek moralists sometimes distinguish and sometimes combine moral virtue and wisdom, ἀρετή and φρόνησις: capacity to perform, and wisdom to guide that capacity. To the ordinary Greek perhaps the emphasis fell on the former, on the attainment of all recognised good quality which

became a man, all that was beautiful and honourable, all that was appropriate, glorious, and fame-giving; and that not for any special reference to its utilitarian qualities. Useful, of course, such qualities were: but that was not in question at the time. In the more liberal commonwealths of ancient Greece there was little or no anxious care to control the education of its citizens, so as to get direct service, overt contribution to the public good. A suspicious Spartan legislation might claim to do that. But in the free air of Athens all that was required was loyalty, good-will — εὔνοια — to the common weal; it might be even a sentiment of human kindliness, of fraternity of spirit and purpose. Everything beyond and upon that basis was left to free development. Let each carry out to the full the development of his powers in the line which national estimation points out. He is — nature and history alike emphasise that fact beyond the reach of doubt, for all except the outlaw and the casual stranger — a member of a community, and as such has a governing instinct and ideal which animates him. But he is also a self-centered individual, with special endowments of nature, in his own person and in the material objects which are his. A purely individualist or selfish use of them is not — to the normal Greek — even dreamed of. He is too deeply rooted in the substance of his community for that: or it is on the ground and in the atmosphere of an assured community that his individuality is to be made to flourish. Nature has secured that his individuality shall rest securely in the presupposition of his citizenship. It seems, therefore, as if he were left free and independent in his personal search for perfection, for distinction. His place is fixed for him: *Spartam nactus es; hanc orna*: his duty is his virtue. That duty, as Plato expresses it, is to do his own deeds — and not meddle with others. Nature and history have arranged that others, in other posts, shall do theirs: that all severally shall energise their function. The very word "duty" seems out of place; if, at least, duty suggests external obligation, an order imposed and a debt to be

discharged. If there be a task-master and a creditor, it is the inflexible order of nature and history: — or, to be more accurate, of nature, the indwelling and permanent reality of things. But the obligation to follow nature is scarcely felt as a yoke of constraint. A man's virtue is to perform his work and to perform it well: to do what he is specially capable of doing, and therefore specially charged to do.

Nowhere has this character of Greek ethics received more classical expression than in the Republic of Plato. In the prelude to his subject — which is the nature of Right and Morality — Plato has touched briefly on certain popular and inadequate views. There is the view that Right has its province in performance of certain single and external acts — in business honesty and commercial straightforwardness. There is the view that it is rendering to each what is due to him; that it consists in the proper reciprocity of services, in the balance of social give and take. There is the critical or hyper-critical view which, from seeing so much that is called justice to be in harmony with the interest of the predominant social order, bluntly identifies mere force or strength as the ground of right. And there are views which regard it as due to social conventions and artifices, to the influence of education, to political arrangements and the operation of irrational prejudices. To all these views Plato objects: not because they are false — for they are all in part, often in large part, true — but because they are inadequate and do not go to the root of the matter. The foundations of right lie, he says, not in external act, but in the inner man: not in convention, but in nature: not in relation to others, but in the constitution of the soul itself. That ethical idea — the idea of right — which seems most obviously to have its centre outside the individual, to live and grow only in the relations between individuals, Plato selects in order to show the independent royalty of the single human soul. The world, as Hume afterwards, called justice artificial: Plato will prove it natural. In a way he

joins company with those who bid us drive out the spectre of duty, of obligation coming upon the soul from social authority, from traditional idea, from religious sanctions. He preaches — or he is about to preach — the autonomy of the will.

The four cardinal virtues of Plato's list are the qualities which go to make a healthy, normal, natural human soul, fit for all activity, equipped with all arms for the battle of life. They tell us what such a soul is, not what it does. They are the qualities which unless a soul has, and has them each perfect, yet all co-operant, its mere outward and single acts have no virtue or merit, but are only lucky accidents at the best. On the other hand, if a man has these constitutive qualities, he will act in the social world, and act well. Plato has said scornful things of mere outward and verbal truthfulness, and has set at the very lowest pitch of degradation the "lie in the soul." His "temperance" or "self-restraint," if it be far from breathing any suggestion of self-suppression or self-assertion, is still farther from any suspicion of asceticism, or war against the flesh. It is the noble harmony of the ruling and the ruled, which makes the latter a partner of the sovereign, and takes from the dictates of the ruler any touch of coercion. It is literally sanity of soul, integrity and purity of spirit; it is what has been sometimes called the beautiful soul — the indiscerptible unity of reason and impulse. Plato's bravery, again, is fortitude and consistency of soul, the full-blooded heart which is fixed in reason, the zeal which is according to knowledge, unflinching loyalty to the idea, the spirit which burns in the martyrs to truth and humanity: yet withal with gentleness and courtesy and noble urbanity in its immediate train. And his truthfulness is that inner lucidity which cannot be self-deceived, the spirit which is a safeguard against fanaticism and hypocrisy, the sunlike warmth of intelligence without which the heart is a darkness full of unclean things.

The full development and crowning grace of such a manly nature Aristotle has tried to present in the character of the Great-souled man — him whom Plato has called the true king by divine right, or the autocrat by the patent of nature. Like all such attempts to delineate a type in the terms necessarily single and successive of abstract analysis, it tends occasionally to run into caricature, and to give partial aspects an absurd prominency. Only the greatest of artists could cope with such a task, though that artist may be found perhaps classed among the historians. Yet it is possible to form some conception of the ideal which Aristotle would set before us. The Great-souled man *is* great, and he dare not deny the witness of his spirit. He is one who does not quail before the anger and seek the applause of popular opinion: he holds his head as his own, and as high as his undimmed self-consciousness shows it is worth. There has been said to him by the reason within him the word that Virgil erewhile addressed to Dante:

“Libero, dritto, e sano è il tuo arbitrio
E fallo fora non fare a suo cenno;
Per ch’ io te sopra te corono e mitrio.”

He is his own Emperor and his own Pope. He is the perfected man, in whom is no darkness, whose soul is utter clearness, and complete harmony. Calm in self-possessed majesty, he stands, if need be, *contra mundum*: but rather, with the world beneath his feet. The chatter of personality has no interest for him. Bent upon the best, lesser competitions for distinction have no attraction for him. To the vulgar he will seem cold, self-confined: in his apartness and distinction they will see the signs of a “prig.” His look will be that of one who pities men — rather than loves them: and should he speak ill of a foe, it is rather out of pride of heart and unbroken spirit than because these things touch him. Such an one, in many ways, was the Florentine poet himself.

If the Greek world in general thus conceived ἀρετή as the full bloom of manly excellence (we all know how slightly — witness the remarks in the Periclean oration — Greeks, in their public and official utterances, rated womanliness), the philosophers had a further point to emphasise. That was what they variously called knowledge, prudence, reason, insight, intelligence, wisdom, truth. From Socrates to Aristotle, from Aristotle to the Stoics and Epicureans, and from the Stoics to the Neo-Platonists, this is the common theme: the supremacy of knowledge, its central and essential relation to virtue. They may differ — perhaps not so widely as current prejudice would suppose — as to how this knowledge is to be defined, what kind of knowledge it is, how acquired and maintained, and so on. But in essentials they are at one. None of them, of course, mean that in order to right conduct nothing more is needed than to learn and remember what is right, the precepts and commandments of ordinary morality. Memory is not knowledge, especially when it is out of mind. Even an ancient philosopher was not wholly devoid of common sense. They held — what they supposed was a fact of observation and reflection — that all action was prompted by feelings of the values of things, by a desire of something good or pleasing to self, and aimed at self-satisfaction and self-realisation, but that there was great mistake in what thus afforded satisfaction. People chose to act wrongly or erroneously, because they were, first, mistaken about themselves and what they wanted, and, secondly, mistaken in the means which would give them satisfaction. But this second point was secondary. The main thing was to know yourself, what you really were; in Plato's words, to "see the soul as it is, and know whether it have one form only or many, or what its nature is; to look upon it with the eye of reason in its original purity." Self-deception, confusion, that worst ignorance which is unaware of itself, false estimation — these are the radical evils of the natural man. To these critics the testimony of consciousness was worthless, unless corroborated. To cure

this mental confusion, this blindness of will and judgment, is the task set for philosophy: to give inward light, to teach true self-measurement. In one passage, much misunderstood, Plato has called this philosophic art the due measurement of pleasures and pains. It should scarcely have been possible to mistake the meaning. But, with the catchwords of Utilitarianism ringing in their ears, the commentators ran straight contrary to the true teaching of the *Protagoras*, consentient as it is with that of the *Phaedo* and the *Philebus*. To measure, one must have a standard: and if Plato has one lesson always for us, it is that a sure standard the multitude have not, but only confusion. The so-called pleasures and pains of the world's experiences are so entitled for different reasons, for contrary aims, and with no unity or harmony of judgment. They are — not a fact to be accepted, but — a problem for investigation: their reality is in question, their genuineness, solidity and purity: and till you have settled that, you cannot measure, for you may be measuring vacuity under the idea that there is substance. You have still to get at the unit — i.e. the reality of pleasure. It was not Plato's view that pleasure was a separate and independent entity: that it was exactly as it was felt. Each pleasure is dependent for its pleasurable quality on the consciousness it belongs to, and has only a relative truth and reality. Bentham has written about computing the value of a "lot" of pleasures and pains. But Plato had his mind on an earlier and more fundamental problem, what is the truth and reality of pleasure; and his fullest but not his only essay towards determining the value or estimating the meaning of pleasure in the scale of being is that given in the *Philebus*.

This then is the knowledge which Greek philosophy meant: not mere intellect — though, of course, there is always a danger of theoretical inquiry degenerating into abstract and formal dogma. But of the meaning there can be no serious doubt. It is a knowledge, says Plato, to which the method of

mathematical science — the most perfect he can find acknowledged — is only an *ouverture*, or perhaps, only the preliminary tuning of the strings. It is a knowledge not eternally hypothetical — a system of sequences which have no sure foundation. It is a knowledge which rests upon the conviction and belief of the "idea of good": a kind of knowledge which does not come by direct teaching, which is not mere theory, but implies a lively conviction, a personal apprehension, a crisis which is a kind of "conversion," or "inspiration." It is as it were the prize of a great contest, in which the sword that conquers is the sword of dialectic: a sword whereof the property is, like that of Ithuriel's spear, to lay bare all deceptions and illusions of life. Or, to vary the metaphor: the son of man is like the prince in the fairy tale who goes forth to win the true queen; but there are many false pretenders decked out to deceive his unwary eyes and foolish heart. Yet in himself there is a power of discernment: there is something kindred with the truth: — the witness of the Spirit — and all that education and discipline can do is to remove obstacles, especially the obstacles within the self which perturb the sight and mislead the judgment. Were not the soul originally possessed of and dominated by the idea of good, it could never discern it elsewhere. On this original kindred depends all the process of education; the influence of which therefore is primarily negative or auxiliary. Thus the process of history and experience, — which the work of education only reproduces in an accelerated *tempo* — serves but to bring out the implicit reason within into explicit conformity with the rationality of the world.

Knowledge, then, in this ethical sphere means the harmony of will, emotion, intellect: it means the clear light which has no illusions and no deceptions. And to those who feel that much of their life and of the common life is founded on prejudice and illusion, such white light will occasionally seem hard and steely. At its approach they fear the loss of the charm of that twilight hour ere the day has yet begun, or before the darkness

has fully settled down. Thus the heart and feelings look upon the intellect as an enemy of sentiment. And Plato himself is not without anticipations of such an issue. Yet perhaps we may add that the danger is in part an imaginary one, and only arises because intelligence takes its task too lightly, and encroaches beyond its proper ground. Philosophy, in other words, mistakes its place when it sets itself up as a dogmatic system of life. Its function is to comprehend, and from comprehension to criticise, and through criticising to unify. It has no positive and additional teaching of its own: no addition to the burden of life and experience. And experience it must respect. Its work is to maintain the organic or super-organic interconnexion between all the spheres of life and all the forms of reality. It has to prevent stagnation and absorption of departments — to keep each in its proper place, but not more than its place, and yet to show how each is not independent of the others. And this is what the philosopher or ancient sage would be. If he is passionless, it is not that he has no passions, but that they no longer perturb and mislead. If his controlling spirit be reason, it is not the reason of the so-called "rationalist," but the reason which seeks in patience to comprehend, and to be at home in, a world it at first finds strange. And if he is critical of others, he is still more critical of himself: critical however not for criticism's sake (which is but a poor thing), but because through criticism the faith of reason may be more fully justified. To the last, if he is true to his mission and faithful to his loyalty to reality, he will have the simplicity of the child.

Whether therefore we agree or not with Plato's reduction of Right and Duty to self-actualisation, we may at least admit that in the idea of perfection or excellence, combined with the idea of knowledge or inward lucidity, he has got the fundamental ideas on which further ethical development must build. Self-control, self-knowledge, internal harmony, are good: and so are the development of our several faculties and of the

totality of them to the fullest pitch of excellence. But their value does not lie entirely in themselves, or rather there is implicit in them a reference to something beyond themselves. They take for granted something which, because it is so taken, may also be ignored and neglected, just because it seems so obvious. And that implication is the social humanity in which they are the spirits of light and leading.

To lay the stress on ἀρετή or excellence tends to leave out of sight the force of duty; and to emphasise knowledge is allowed to disparage the heart and feelings. The mind — even of a philosopher — finds a difficulty in holding very different points of view in one, and where it is forced from one to another, tends to forget the earlier altogether. Thus when the ethical philosopher, presupposing as an absolute or unquestionable fact that man the individual was rooted in the community, proceeded to discuss the problem of the best and completest individual estate, he was easily led to lose sight of the fundamental and governing condition altogether. From the moment that Aristotle lays down the thesis that man is naturally social, to the moment when he asks how the bare ideal of excellence in character and life can become an actuality, the community in which man lives has retired out of sight away into the background. And it only comes in, as it first appears, as the paedagogue to bring us to morality. And Plato, though professedly he is speaking of the community, and is well aware that the individual can only be saved by the salvation of the community, is constantly falling back into another problem — the development of an individual soul. He feels the strength of the egoistic effort after perfection, and his essay in the end tends to lose sight altogether of its second theme. Instead of a man he gives us a mere philosopher, a man, that is, not living with his country's life, instinct with the heart and feeling of humanity, inspired by art and religion, but a being set apart and exalted above his fellows, — charged no doubt in theory with the duty of saving them, of

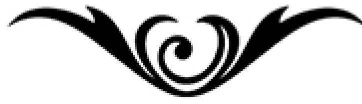
acting vicariously as the mediator between them and the absolute truth — but really tending more and more to seclude himself on the *edita templa* of the world, on the high-towers of speculation.

And what Plato and Aristotle did, so to speak, against their express purpose and effort, yet did, because the force of contemporary tendency was irresistible — that the Stoa and Epicurus did more openly and professedly. With a difference in theory, it is true, owing to the difference in the surroundings. Virtue in the older day of the free and glorious commonwealth had meant physical and intellectual achievement, acts done in the public eye, and of course for the public good — a good with which the agent was identified at least in heart and soul, if not in his explicit consciousness. In later and worse days, when the political world, with the world divine, had withdrawn from actual identity with the central heart of the individual, and stood over-against him as a strange power and little better than a nuisance, virtue came to be counted as endurance, indifference, negative independence against a cold and a perplexing world. But even still, virtue is excellence: it is to rise above the ignoble level: to assert self-liberty against accident and circumstance — to attain self-controlled, self-satisfying independence — and to become God-like in its seclusion. Yet in two directions even it had to acknowledge something beyond the individual. The Epicurean — following out a suggestion of Aristotle — recognised the help which the free society of friends gave to the full development of the single seeker after a self-satisfying and complete life. The Stoic, not altogether refusing such help, tended rather to rest his single self on a fellowship of ideal sort, on the great city of gods and men, the *civitas Dei*. Thus, in separate halves, the two schools, into which Greek ethics was divided, gave expression to the sense that a new and higher community was needed — to the sense that the visible actual community no longer realised its latent idea. The Stoic emphasised the all-embracing necessity, the

absolute comprehensiveness of the moral kingdom. The Epicurean saw more clearly that, if the everlasting city came from heaven, it could only visibly arise by initiation upon the earth. Christianity — in its best work — was a conjunction of the liberty with the necessity, of the human with the divine.

More interesting, perhaps, it is to note the misconception of reason and knowledge which grew up. Knowledge came more and more to be identified with the reflective and critical consciousness, which is outside reality and life, and judges it from a standpoint of its own. It came to be esteemed only in its formal and abstract shape, and at the expense of the heart and feelings. The antithesis of philosophy (or knowledge strictly so called) according to Plato was mere opinion, accidental and imperfect knowledge. The knowledge which is truly valuable is a knowledge which presupposes the full reality of life, and is the more and more completely articulated theory of it as a whole. It is — abstractly taken — a mere form of unity which has no value except in uniting: it is — taken concretely — the matter, we may say, in complete unity. It is ideal and perfect harmony of thought, appetite, and emotion: or putting it otherwise, the philosopher is one who is not merely a creature of appetite and production, not merely a creature of feeling and practical energy, but a creature, who to both of these superadds an intelligence which sets eyes in the blind forehead of these other powers, and thus, far from superseding them altogether, only raises them into completeness, and realises all that is worthy in their implicit natures. Always these two impulsive tendencies of our nature are guided by some sort of ideas and intelligence, by beliefs and opinions. But they, like their guides, are sporadically emergent, unconnected, and therefore apt to be contradictory. It is to such erratic and occasional ideas, half-truths and deceptions, that philosophy is opposed. Unfortunately for all parties, the antithesis is carried farther. Philosophy and the philosopher are further set in

opposition to the faith of the heart, the intimacy and intensity of feeling, the depth of love and trust, which in practice often go along with imperfect ideas. The philosopher is made one who has emancipated himself from the heart and feelings, — a pure intelligence, who is set above all creeds, contemplating all, and holding none. Consistency and clearness become his idol, to be worshipped at any cost, save one sacrifice: and that one sacrifice is the sacrifice of his own self-conceit. For consistency generally means that all is made to harmonise with one assumed standpoint, and that whatever presents discrepancies with this alleged standard is ruthlessly thrown away. Such a philosophy mistakes its function, which is not, as Heine scoffs, to make an intelligible system by rejecting the discordant fragments of life, but to follow reverently, if slowly, in the wake of experience. Such a "perfect sage," with his parade of reasonableness, may often assume the post of a dictator.



And, above all, intelligence is only half itself when it is not also will. And both are more than mere consciousness. Plato — whom we refer to, because he is the coryphaeus of all the diverse host of Greek philosophy — seems to overestimate or rather to misconceive the place of knowledge. That it is the supreme and crowning grace of the soul, he sees. But he tends to identify it with the supreme or higher soul: — as Aristotle did after him, to be followed by the Stoics and Neo-Platonists. For them the supreme, or almost supreme reality is the intelligence or reason: the soul is only on a second grade of reality, on the borders of the natural or physical world. When Plato takes that line, he turns towards the path of asceticism, and treats the philosophic life as a preparation for that truer life when intelligence shall be all in all, for that better land where "divine dialogues" shall form the staple and substance of spiritual existence. Aristotle, — who less often treads these solitudes, — still extols the theoretic life, when the body and its needs trouble no more, when the activity of reason — the

theory of theory — is attained at least as entirely as mortal conditions allow man to be deified. Of the "apathy" and the reasonable conformity of the Stoics, or of the purely negative character of Epicurean happiness (the excision of all that pained) we need not here speak. And in Plotinus and Proclus the deification of mere reason is at any rate the dominant note; whatever protests the larger Greek nature in the former may from time to time offer. The truth which philosophy should have taught was that Mind or intelligence was the element where the inner life culminated and expanded and flourished: the error which it often tended to spread was that intelligence was the higher life of which all other was a degenerate shortcoming, and something valuable on its own account.

It may be that thus to interpret Plato is to do him an injustice. It has been sometimes said that his division of parts or kinds of soul — or his distinction between its fighting horses — tends to destroy the unity of mental life. But perhaps this was exactly what he wanted to convey. There are — we may paraphrase his meaning — three kinds of human being, three types of human life. There is the man or the life of appetite and the flesh: there is the man of noble emotion and energetic depth of soul: there is the life of reasonable pursuits and organised principle. Or, we may take his meaning to be that there are three elements or provinces of mental life, which in all except a few are but imperfectly coherent and do not reach a true or complete unity. Some unity there always is: but in the life of mere appetite and impulse, even when these impulses are our nobler sentiments of love and hatred, the unity falls very far short. Or, as he puts the theme elsewhere, the soul has a passion for self-completion, a love of beauty, which in most is but a misleading lust. It is the business of the philosophic life to re-create or to foster this unity: or philosophy is the persistent search of the soul for its lost unity, the search to see that unity which is always its animating principle, its inner faith. When the soul has reached this ideal —

if it can be supposed to attain it (and of this the strong-souled ancient philosophers feel no doubt), — then a change must take place. The love of beauty is not suppressed; it is only made self-assured and its object freed from all imperfection. It is not that passion has ceased; but its nature is so transfigured, that it seems worthy of a nobler name, which yet we cannot give. To such a life, where battle and conflict are as such unknown, we cannot longer give the title of life: and we say that philosophy is in life a rehearsal of death[70]. And yet if there be no battle, there is not for that reason mere inaction. Hence, as the Republic concludes, the true philosopher is the complete man. He is the truth and reality which the appetitive and emotional man were seeking after and failed to realise. It is true they at first will not see this. But the whole long process of philosophy is the means to induce this conviction. And for Plato it remains clear that through experience, through wisdom, and through abstract deduction, the philosopher will justify his claim to him who hath ears to hear and heart to understand. If that be so, the asceticism of Plato is not a mere war upon flesh and sense as such, but upon flesh and sense as imperfect truth, fragmentary reality, which suppose themselves complete, though they are again and again confuted by experience, by wisdom, and by mere calculation, — a war against their blindness and shortsightedness.

Essay IV. Psycho-Genesis.

"THE KEY," SAYS Carus, "for the ascertainment of the nature of the conscious psychical life lies in the region of the unconscious[71]." The view which these words take is at least as old as the days of Leibniz. It means that the mental world does not abruptly emerge a full-grown intelligence, but has a genesis, and follows a law of development: that its life may be described as the differentiation (with integration) of a simple or indifferentiated mass. The terms conscious and unconscious, indeed, with their lax popular uses, leave the door wide open for misconception. But they may serve to mark that the mind is to be understood only in a certain relation (partly of antithesis) to nature, and the soul only in reference to the body. The so-called "superior faculties" — specially characteristic of humanity — are founded upon, and do not abruptly supersede, the lower powers which are supposed to be specially obvious in the animals[72]. The individual and specific phenomena of consciousness, which the psychologist is generally supposed to study, rest upon a deeper, less explicated, more indefinite, life of sensibility, which in its turn fades away by immeasurable gradations into something irresponsive to the ordinary tests for sensation and life.

And yet the moment we attempt to leave the daylight of consciousness for the darker sides of sub-conscious life, the risks of misinterpretation multiply. The problem is to some extent the same as confronts the student of the ideas and principles of primitive races. There, the temptation of seeing things through the "spectacles of civilisation" is almost irresistible. So in psychology we are apt to import into the life of sensation and feeling the

distinctions and relations of subsequent intellection. Nor is the difficulty lessened by Hegel's method which deals with soul, sentiency, and consciousness as grades or general characteristics in a developmental advance. He borrows his illustrations from many quarters, from morbid and anomalous states of consciousness, — less from the cases of savages, children and animals. These illustrations may be called a loose induction. But it requires a much more powerful instrument than mere induction to build up a scientific system; a framework of general principle or theory is the only basis on which to build theory by the allegation of facts, however numerous. Yet in philosophic science, which is systematised knowledge, all facts strictly so described will find their place and be estimated at their proper value.

(i.) Primitive Sensibility.

Psychology (with Hegel) takes up the work of science from biology. The mind comes before it as the supreme product of the natural world, the finest flower of organic life, the "truth" of the physical process. As such it is called by the time-honoured name of Soul. If we further go on to say that the soul is the principle of life, we must not understand this vital principle to be something over and above the life of which it is the principle. Such a locally-separable principle is an addition which is due to the analogy of mechanical movement, where a detached agent sets in motion and directs the machinery. But in the organism the principle is not thus detachable as a thing or agent. By calling Soul the principle of life we rather mean that in the vital organism, so far as it *lives*, all the real variety, separation, and discontinuity of parts must be reduced to unity and identity, or as Hegel would say, to *ideality*. To live is thus to keep all differences fluid and permeable in the fire of the life-process. Or to use a familiar term of logic, the Soul is the concept or intelligible unity of the organic body. But to call it

a concept might suggest that it is only the conception through which *we* represent to ourselves the variety in unity of the organism. The soul, however, is more than a mere concept: and life is more than a mere mode of description for a group of movements forming an objective unity. It is a unity, subjective and objective. The organism is one life, controlling difference: and it is also one by our effort to comprehend it. The Soul therefore is in Hegelian language described as the Idea rather than the concept of the organic body. Life is the generic title for this subject-object: but the life may be merely physical, or it may be intellectual and practical, or it may be absolute, i.e. will and know all that it is, and be all that it knows and wills.

Up to this point the world is what is called an external, which is here taken to mean (not a world external to the individual, but) a self-externalised world. That is to say, it is the observer who has hitherto by his interpretation of his perceptions supplied the “Spirit in Nature.” In itself the external world has no inside, no centre: it is we who read into it the conception of a life-history. We are led to believe that a principle of unity is always at work throughout the physical world — even in the mathematical laws of natural operation. It is only intelligible and credible to us as a system, a continuous and regular development. But that system is only a hypothetical idea, though it is held to be a conclusion to which all the evidence seems unequivocally to point. And, even in organic life, the unity, though more perfect and palpable than in the mechanical and inorganic world, is only a perception, a vision, — a necessary mode of realising the unity of the facts. The phenomenon of life reveals as in a picture and an ocular demonstration the conformity of inward and outward, the identity of whole and parts, of power and utterance. But it is still outside the observer. In the function of sensibility and sentiency, however, we stand as it were on the border-line between biology and psychology. At one step we have been

brought within the harmony, and are no longer mere observers and reflecters. The sentient not merely is, but is aware that it is. Hitherto as life, it only is the unity in diversity, and diversity in unity, for the outsider, i.e. only implicitly: now it is so for itself, or consciously. And in the first stage it does not know, but feels or is sentient. Here, for the first time, is created the distinction of inward and outward. Loosely indeed we may, like Mr. Spencer, speak of outward and inward in physiology: but strictly speaking, what Goethe says is true, *Natur hat weder Kern noch Schaale*[73]. Nature in the narrower sense knows no distinction of the inward and outward in its phenomena: it is a purely superficial order and succession of appearance and event. The Idea which has been visible to an intelligent percipient in the types and laws of the natural world, now *is*, actually is — is in and for itself — but at first in a minimum of content, a mere point of light, or rather the dawn which has yet to expand into the full day.

Spinoza has asserted that "all individual bodies are animate, though in different degrees[74]." Now it is to a great extent this diversity of degree on which the main interest turns. Yet it is well to remember that the abrupt and trenchant separations which popular practice loves are overridden to a deeper view by an essential unity of idea, reducing them to indifference. If, that is, we take seriously the Spinozist unity of Substance, and the continual correlation (to call it no more) of extension and consciousness therein, we cannot avoid the conclusion which even Bacon would admit of something describable as attraction and perception, something subduing diversity to unity. But whether it be well to name this soul or life is a different matter. It may indeed only be taken to mean that all true being must be looked on as a real unity and individuality, must, that is, be conceived as manifesting itself in organisation, must be referred to a self-centred and self-developing activity. But this — which is the fundamental thesis of idealism — is hardly all that is meant. Rather Spinoza would imply that all things which form a

real unity must have life — must have inner principle and unifying reality: and what he teaches is closely akin to the Leibnitian doctrine that every substantial existence reposes upon a monad, a unity which is at once both a force and a cognition, a "representation" and an appetite or *nisus* to act. When Fechner in a series of works[75] expounds and defends the hypothesis that plants and planets are not destitute of soul, any more than man and animals, he only gives a more pronounced expression to this idealisation or spiritualisation of the natural world. But for the moment the point to be noted is that all of this idealistic doctrine is an inference, or a development which finds its *point d'appui* in the fact of sensation. And the problem of the Philosophy of Mind is just to trace the process whereby a mere shock of sensation has grown into a conception and a faith in the goodness, beauty and intelligence of the world.

Schopenhauer has put the point with his usual picturesqueness. Outward nature presents nothing but a play of forces. At first, however, this force shows merely the mechanical phenomena of pressure and impact, and its theory is sufficiently described by mathematical physics. But in the process of nature force assumes higher types, types where it loses a certain amount of its externality[76], till in the organic world it acquires a peculiar phase which Schopenhauer calls *Will*, meaning by that, however, an organising and controlling power, a tendency or *nisus* to be and live, which is persistent and potent, but without consciousness. This blind force, which however has a certain coherence and purposiveness, is in the animal organism endowed with a new character, in consequence of the emergence of a new organ. This organ, the brain and nervous system, causes the evolution into clear day of an element which has been growing more and more urgent. The gathering tendency of force to return into itself is now complete: the cycle of operation is formed: and the junction of the two

currents issues in the spark of sensation. The blind force now becomes seeing.

But at first — and this is the point we have to emphasise — its powers of vision are limited. Sensibility is either a local and restricted phenomenon: or, in so far as it is not local, it is vague and indefinite, and hardly entitled to the name of sensibility. Either it is a dim, but far-reaching, sympathy with environing existence, and in that case only so-called blind will or feeling: or if it is clear, is locally confined, and at first within very narrow limits. Neither of these points must be lost sight of. On the one hand feeling has to be regarded as the dull and confused stirring of an almost infinite sympathy with the world — a pulse which has come from the far-distant movements of the universe, and bears with it, if but as a possibility, the wealth of an infinite message. On the other hand, feeling at first only becomes real, in this boundless ideality to which its possibilities extend, by restricting itself to one little point and from several points organising itself to a unity of bodily feeling, till it can go on from thence to embrace the universe in distinct and articulate comprehension.

Soul, says Hegel, is not a separate and additional something over and above the rest of nature: it is rather nature's "'universal immaterialism, and simple ideal life[77]." There were ancient philosophers who spoke of the soul as a self-adjusting number, — as a harmony, or equilibrium[78] — and the moderns have added considerably to the list of these analogical definitions. As definitions they obviously fall short. Yet these things give, as it were, by anticipation, an image of soul, as the "ideality," which reduces the manifold to unity. The adhesions and cohesions of matter, its gravitating attractions, its chemical affinities and electrical polarities, the intricate out-and-in of organic structure, are all preludes to the true incorporating unity which is the ever-immanent supersession of the endless self-externalism and successionalism of physical reality. But in sentiency, feeling, or sensibility,

the unity which all of these imply without reaching, is explicitly present. It is implicitly an all-embracing unity: an infinite, — which has no doors and no windows, for the good reason that it needs none, because it has nothing outside it, because it “expresses” and “envelopes” (however confusedly at first) the whole universe. Thus, even if, with localising phraseology, we may describe mind, where it *appears* emerging in the natural world, as a mere feeble and incidental outburst, — a rebellion breaking out as in some petty province or isolated region against the great law of the physical realm — we are in so speaking taking only an external standpoint. But with the rise of mind in nature the bond of externalism is implicitly overcome. To it, and where it really is, there is nothing outside, nothing transcendent. Everything which is said to be outside mind is only outside a localised and limited mind — outside a mind which is imperfectly and abstractly realised — not outside mind absolutely. Mind is the absolute negation of externality: not a mere relative negative, as the organism may be biologically described as inner in respect of the environment. To accomplish this negation in actuality, to bring the multiplicity and externality of things into the unity and identity of one Idea, is the process of development of mind from animal sensibility to philosophic knowledge, from appetite to art, — the process of culture through the social state under the influence of religion.

Sentiency or psychic matter (mind-stuff), to begin with, is in some respects like the *tabula rasa* of the empiricists. It is the possibility — but the real possibility — of intelligence rather than intelligence itself. It is the monotonous undifferentiated inwardness — a faint self-awareness and self-realisation of the material world, but at first a mere vague *psychical protoplasm* and without defined nucleus, without perceptible organisation or separation of structures. If there is self-awareness, it is not yet discriminated into a distinct and unified self, not yet differentiated and integrated, — soul in the condition of a mere “Is,” which, however, is

nothing determinate. It is very much in the situation of Condillac's statue-man — *une statue organisée intérieurement comme nous, et animée d'un esprit privé de toute espèce d'idées*: alike at least so far that the rigid uniformity of the latter's envelope prevents all articulated organisation of its faculties. The foundation under all the diversity and individuality in the concrete intelligent and volitional life is a common feeling, — a *sensus communis* — a general and indeterminate susceptibility to influence, a sympathy responsive, but responsive vaguely and equivocally, to all the stimuli of the physical environment. There was once a time, according to primitive legend, when man understood the language of beast and bird, and even surprised the secret converse of trees and flowers. Such fancies are but the exaggeration of a solidarity of conscious life which seems to spread far in the sub-conscious realm, and to narrow the individual's soul into limited channels as it rises into clear self-perception,

"As thro' the frame that binds him in
His isolation grows defined."

It may be a mere dream that, as Goethe feigns of Makaria in his romance[79], there are men and women in sympathy with the vicissitudes of the starry regions: and hypotheses of lunar influence, or dogmas of astrological destiny, may count to the present guardians of the sciences as visionary superstitions. Yet science in these regions has no reason to be dogmatic; her function hitherto can only be critical; and even for that, her data are scanty and her principles extremely general. The influences on the mental mood and faculty, produced by climate and seasons, by local environment and national type, by individual peculiarities, by the differences of age and sex, and by the alternation of night and day, of sleep and waking, are less questionable. It is easy no doubt to ignore or forget them: easy to remark how indefinable and incalculable they are. But that does not lessen their radical and inevitable impress in the determination of

the whole character. “The sum of our existence, divided by reason, never comes out exact, but always leaves a marvellous remainder[80].” Irrational this residue is, in the sense that it is inexplicable, and incommensurable with the well-known quantities of conscious and voluntarily organised life. But a scientific psychology, which is adequate to the real and concrete mind, should never lose sight of the fact that every one of its propositions in regard to the more advanced phases of intellectual development is thoroughly and in indefinable ways modified by these preconditions. When that is remembered, it will be obvious how complicated is the problem of adapting psychology for the application to education, and how dependent the solution of that problem is upon an experiential familiarity with the data of individual and national temperament and character.

The first stage in mental development is the establishment of regular and uniform relations between soul and body: it is the differentiation of organs and the integration of function: the balance between sensation and movement, between the afferent and efferent processes of sensitivity. Given a potential soul, the problem is to make it actual in an individual body. It is the business of a physical psychology to describe in detail the steps by which the body we are attached to is made inward as our idea through the several organs and their nervous appurtenances: whereas a psychical physiology would conversely explain the corresponding processes for the expression of the emotions and for the objectification of the volitions. Thus soul inwardises (*erinnert*) or envelops body: which body “expresses” or develops soul. The actual soul is the unity of both, is the percipient individual. The solidarity or “communion” of body and soul is here the dominant fact: the soul sentient of changes in its peripheral organs, and transmitting emotion and volition into physical effect. It is on this psychical unity, — the unity which is the soul of the diversity of body — that all the subsequent developments of mind rest. Sensation is thus the *prius* — or

basis — of all mental life: the organisation of soul in body and of body in soul. It is the process which historically has been prepared in the evolution of animal life from those undifferentiated forms where specialised organs are yet unknown, and which each individual has further to realise and complete for himself, by learning to see and hear, and use his limbs. At first, moreover, it begins from many separate centres and only through much collision and mutual compliance arrives at comparative uniformity and centralisation. The common basis of united sensibility supplied by the one organism has to be made real and effective, and it is so at first by sporadic and comparatively independent developments. If self-hood means reference to self of what is prima facie not self, and projection of self therein, there is in primitive sensibility only the germ or possibility of self-hood. In the early phases of psychic development the centre is fluctuating and ill-defined, and it takes time and trouble to co-ordinate or unify the various starting-points of sensibility[81].

This consolidation of inward life may be looked at either formally or concretely. Under the first head, it means the growth of a central unity of apperception. In the second case, it means a peculiar aggregate of ideas and sentiments. There is growing up within him what we may call the individuality of the individual, — an irrational, i.e. not consciously intelligent, nether-self or inner soul, a firm aggregation of hopes and wishes, of views and feelings, or rather of tendencies and temperament, of character hereditary and acquired. It is the law of the natural will or character which from an inaccessible background dominates our action, — which, because it is not realised and formulated in consciousness, behaves like a guardian spirit, or genius, or destiny within us. This genius is the sub-conscious unity of the sensitive life — the manner of man which unknown to ourselves we are, — and which influences us against our nominal or formal purposes. So far as this predominates, our ends, rough hew them

how we will, are given by a force which is not really, i.e. with full consciousness, ours: by a mass of ingrained prejudice and unreasoned sympathies, of instincts and passions, of fancies and feelings, which have condensed and organised themselves into a natural power. As the child in the mother's womb is responsive to her psychic influences, so the development of a man's psychic life is guided by feelings centred in objects and agents external to him, who form the genius presiding over his development. His soul, to that extent, is really in another: he himself is selfless, and when his stay is removed the principle of his life is gone[82]. He is but a bundle of impressions, held together by influences and ties which in years before consciousness proper began made him what he is. Such is the involuntary adaptation to example and environment, which establishes in the depths below personality a self which becomes hereafter the determinant of action. Early years, in which the human being is naturally susceptible, build up by imitation, by pliant obedience, an image, a system, reproducing the immediate surroundings. The soul, as yet selfless, and ready to accept any imprint, readily moulds itself into the likeness of an authoritative influence.

The step by which the universality or unity of the self is realised in the variety of its sensation is Habit. Habit gives us a definite standing-ground in the flux of single impressions: it is the identification of ourselves with what is most customary and familiar: an identification which takes place by practice and repetition. If it circumscribes us to one little province of being, it on the other frees us from the vague indeterminateness where we are at the mercy of every passing mood. It makes thus much of our potential selves our very own, our acquisition and permanent possession. It, above all, makes us free and at one with our bodily part, so that henceforth we start as a subjective unit of body and soul. We have now as the result of the anthropological process a self or ego, an individual consciousness able to

reflect and compare, setting itself on one side (a soul in bodily organisation), and on the other setting an object of consciousness, or external world, a world of other things. All this presupposes that the soul has actualised itself by appropriating and acquiring as its expression and organ the physical sensibility which is its body. By restricting and establishing itself, it has gained a fixed standpoint. No doubt it has localised and confined itself, but it is no longer at the disposal of externals and accident: it has laid the foundation for higher developments.

(ii.) Anomalies of Psychical Life.

Psychology, as we have seen, goes for information regarding the earlier stages of mental growth to the child and the animal, — perhaps also to the savage. So too sociology founds certain conclusions upon the observations of savage customs and institutions, or on the earlier records of the race. In both cases with a limitation caused by the externality and fragmentariness of the facts and the need of interpreting them through our own conscious experiences. There is however another direction in which corresponding inquiries may be pursued; and where the danger of the conclusions arrived at, though not perhaps less real, is certainly of a different kind. In sociology we can observe — and almost experiment upon — the phenomena of the lapsed, degenerate and criminal classes. The advantage of such observation is that the object of study can be made to throw greater light on his own inner states. He is a little of the child and a little of the savage, but these aspects co-exist with other features which put him more on a level with the intelligent observer. Similar pathological regions are open to us in the case of psychology. There the anomalous and morbid conditions of mind co-exist with a certain amount of mature consciousness. So presented, they are thrown out into relief. They form the negative instances which serve to corroborate our positive inductions. The regularly concatenated and solid

structure of normal mind is under abnormal and deranged conditions thrown into disorder, and its constituents are presented in their several isolation. Such phenomena are relapses into more rudimentary grades: but with the difference that they are set in the midst of a more advanced phase of intellectual life.

Even amongst candid and honest-minded students of psychology there is a certain reluctance to dabble in researches into the night-side of the mental range. Herbart is an instance of this shrinking. The region of the Unconscious seemed — and to many still seems — a region in which the charlatan and the dupe can and must play into each other's hands. Once in the whirl of spiritualist and crypto-psychical inquiry you could not tell how far you might be carried. The facts moreover were of a peculiar type. Dependent as they seemed to be on the frame of mind of observers and observed, they defied the ordinary criteria of detached and abstract observation. You can only observe them, it is urged, when you believe; scepticism destroys them. Now there is a widespread natural impatience against what Bacon has called "monodical" phenomena, phenomena i.e. which claim to come under a special law of their own, or to have a private and privileged sphere. And this impatience cuts the Gordian knot by a determination to treat all instances which oppose its hitherto ascertained laws as due to deception and fraud, or, at the best, to incompetent observation, confusions of memory, and superstitions of ignorance. Above all, great interests of religion and personality seemed to connect themselves with these revelations — interests, at any rate, to which our common humanity thrills; it seemed as if, in this region beyond the customary range of the conscious and the seen, one might learn something of the deeper realities which lie in the unseen. But to feel that so much was at stake was naturally unfavourable to purely dispassionate observation.

The philosophers were found — as might have been expected — amongst those most strongly attracted by these problems. Even Kant had been fascinated by the spiritualism of Swedenborg, though he finally turned away sceptical. At least as early as 1806 Schelling had been interested by Ritter's researches into the question of telepathy, or the power of the human will to produce without mechanical means of conveyance an effect at a distance. He was looking forward to the rise of a *Physica coelestis*, or New Celestial Physics, which should justify the old magic. About the same date his brother Karl published an essay on Animal Magnetism. The novel phenomena of galvanism and its congeners suggested vast possibilities in the range of the physical powers, especially of the physical powers of the human psyche as a natural agent. The divining-rod was revived. Clairvoyance and somnambulism were carefully studied, and the curative powers of animal magnetism found many advocates[83].

Interest in these questions went naturally with the new conception of the place of Man in Nature, and of Nature as the matrix of mind[84]. But it had been acutely stimulated by the performances and professions of Mesmer at Vienna and Paris in the last quarter of the eighteenth century. These — though by no means really novel — had forced the artificial world of science and fashion to discuss the claim advanced for a new force which, amongst other things, could cure ailments that baffled the ordinary practitioner. This new force — mainly because of the recent interest in the remarkable advances of magnetic and electrical research — was conceived as a fluid, and called Animal Magnetism. At one time indeed Mesmer actually employed a magnet in the manipulation by which he induced the peculiar condition in his patients. The accompaniments of his procedure were in many respects those of the quack-doctor; and with the quack indeed he was often classed. A French commission of inquiry appointed to examine into his performances reported in 1784 that, while there was no

doubt as to the reality of many of the phenomena, and even of the cures, there was no evidence for the alleged new physical force, and declared the effects to be mainly attributable to the influence of imagination. And with the mention of this familiar phrase, further explanation was supposed to be rendered superfluous.

In France political excitement allowed the mesmeric theory and practice to drop out of notice till the fall of the first Empire. But in Germany there was a considerable amount of investigations and hypotheses into these mystical phenomena, though rarely by the ordinary routine workers in the scientific field. The phenomena where they were discussed were studied and interpreted in two directions. Some theorists, like Jung-Stilling, Eschenmayer, Schubert, and Kerner, took the more metaphysicist and spiritualistic view: they saw in them the witness to a higher truth, to the presence and operation in this lower world of a higher and spiritual matter, a so-called ether. Thus Animal Magnetism supplied a sort of physical theory of the other world and the other life. Jung-Stilling, e.g. in his "Theory of Spirit-lore." (1808), regarded the spiritualistic phenomena as a justification of — what he believed to be — the Kantian doctrine that in the truly real and persistent world space and time are no more. The other direction of inquiry kept more to the physical field. Ritter (whose researches interested both Schelling and Hegel) supposed he had detected the new force underlying mesmerism and the like, and gave to it the name of Siderism (1808); while Amoretti of Milan named the object of his experiments Animal Electrometry (1816). Kieser[85], again (1826) spoke of Tellurism, and connected animal magnetism with the play of general terrestrial forces in the human being.

At a later date (1857) Schindler, in his "Magical Spirit-life," expounded a theory of mental polarity. The psychical life has two poles or centres, — its day-pole, around which revolves our ordinary and superficial current of

ideas, and its night-pole, round which gathers the sub-conscious and deeper group of beliefs and sentiments. Either life has a memory, a consciousness, a world of its own: and they flourish to a large extent inversely to each other. The day-world has for its organs of receiving information the ordinary senses. But the magical or night-world of the soul has its feelers also, which set men directly in telepathic rapport with influences, however distant, exerted by the whole world: and through this "inner sense" which serves to concentrate in itself all the telluric forces (— a sense which in its various aspects we name instinct, presentiment, conscience) is constructed the fabric of our sub-conscious system. Through it man is a sort of résumé of all the cosmic life, in secret affinity and sympathy with all natural processes; and by the will which stands in response therewith he can exercise a directly creative action on external nature. In normal and healthy conditions the two currents of psychic life run on harmonious but independent. But in the phenomena of somnambulism, clairvoyance, and delirium, the magic region becomes preponderant, and comes into collision with the other. The dark-world emerges into the realm of day as a portentous power: and there is the feeling of a double personality, or of an indwelling genius, familiar spirit, or demon.

To the ordinary physicist the so-called *Actio in distans* was a hopeless stumbling-block. If he did not comprehend the transmission (as it is called) of force where there was immediate contact, he was at least perfectly familiar with the outer aspect of it as a condition of his limited experience. It needed one beyond the mere hodman of science to say with Laplace: "We are so far from knowing all the agents of nature, that it would be very unphilosophical to deny the existence of phenomena solely because they are inexplicable in the present state of our knowledge." Accordingly mesmerism and its allied manifestations were generally abandoned to the bohemians of science, and to investigators with dogmatic bias. It was still

employed as a treatment for certain ailments: and philosophers, as different as Fichte and Schopenhauer[86], watched its fate with attention. But the herd of professional scientists fought shy of it. The experiments of Braid at Manchester in 1841 gradually helped to give research into the subject a new character. Under the name of Hypnotism (or, rather at first Neuro-hypnotism) he described the phenomena of the magnetic sleep (induced through prolonged staring at a bright object), such as abnormal rigidity of body, perverted sensibility, and the remarkable obedience of the subject to the command or suggestions of the operator. Thirty years afterwards, the matter became an object of considerable experimental and theoretic work in France, at the rival schools of Paris and Nancy; and the question, mainly under the title of hypnotism, though the older name is still occasionally heard, has been for several years brought prominently under public notice.

It cannot be said that the net results of these observations and hypotheses are of a very definitive character. While a large amount of controversy has been waged on the comparative importance of the several methods and instruments by which the hypnotic or mesmeric trance may be induced, and a scarcely less wide range of divergence prevails with regard to the physiological and pathological conditions in connexion with which it has been most conspicuously manifested, there has been less anxiety shown to determine its precise psychical nature, or its significance in mental development. And yet the better understanding of these aspects may throw light on several points connected with primitive religion and the history of early civilisation, indeed over the whole range of what is called *Völkerpsychologie*. Indeed this is one of the points which may be said to emerge out of the confusion of dispute. Phenomena at least analogous to those styled hypnotic have a wide range in the anthropological sphere[87]: and the proper characters which belong to them will only be caught by an observer who examines them in the widest variety of examples. Another

feature which has been put in prominence is what has been called "psychological automatism." And in this name two points seem to deserve note. The first is the spontaneous and as it were mechanical consecution of mental states in the soul whence the interfering effect of voluntary consciousness has been removed. And the second is the unfailing or accurate regularity, so contrary to the hesitating and uncertain procedure of our conscious and reasoned action, which so often is seen in the unreflecting and unreasoned movements. To this invariable sequence of psychical movement the superior control and direction by the intelligent self has to adapt itself, just as it respects the order of physical laws.

But, perhaps, the chief conclusion to be derived from hypnotic experience is the value of suggestion or suggestibility. Even cool thinkers like Kant have recognised how much mere mental control has to do with bodily state, — how each of us, in this way, is often for good or for ill his own physician. An idea is a force, and is only inactive in so far as it is held in check by other ideas. "There is no such thing as hypnotism," says one: "there are only different degrees of suggestibility." This may be to exaggerate: yet it serves to impress the comparatively secondary character of many of the circumstances on which the specially mesmeric or hypnotic experimentalist is apt to lay exclusive stress. The methods may probably vary according to circumstances. But the essence of them all is to get the patient out of the general frame and system of ideas and perceptions in which his ordinary individuality is encased. Considering how for all of us the reality of concrete life is bound up with our visual perceptions, how largely our sanity depends upon the spatial idea, and how that depends on free ocular range, we can understand that darkness and temporary loss of vision are powerful auxiliaries in the hypnotic process, as in magical and superstitious rites. But a great deal short of this may serve to establish

influence. The mind of the majority of human beings, but especially of the young, may be compared to a vacant seat waiting for some one to fill it.

In Hegel's view hypnotic phenomena produce a kind of temporary and artificial atavism. Mechanical or chemical means, or morbid conditions of body, may cause even for the intelligent adult a relapse into states of mind closely resembling those exhibited by the primitive or the infantile sensibility. The intelligent personality, where powers are bound up with limitations and operate through a chain of means and ends, is reduced to its primitively undifferentiated condition. Not that it is restored to its infantile simplicity; but that all subsequent acquirements operate only as a concentrated individuality, or mass of will and character, released from the control of the self-possessed mind, and invested (by the latter's withdrawal) with a new quasi-personality of their own. With the loss of the world of outward things, there may go, it is supposed, a clearer perception of the inward and particularly of the organic life. The Soul contains the form of unity which other experiences had impressed upon it: but this form avails in its subterranean existence where it creates a sort of inner self. And this inner self is no longer, like the embodied self of ordinary consciousness, an intelligence served by organs, and proceeding by induction and inference. Its knowledge is not mediated or carried along specific channels: it does not build up, piecemeal, by successive steps of synthesis and analysis, by gradual idealisation, the organised totality of its intellectual world. The somnambulist and the clairvoyant see without eyes, and carry their vision directly into regions where the waking consciousness of orderly intelligence cannot enter. But that region is not the world of our higher ideas, — of art, religion, and philosophy. It is still the sensitivity — that realm of sensitivity which is ordinarily covered by unconsciousness. Such sensitive clairvoyants may, as it were, hear themselves growing; they may discern the hidden quivers and pulses of blood and tissue, the seats of secret pain and all the

unrevealed workings in the dark chambers of the flesh. But always their vision seems confined to that region, and will fall short of the world of light and ideal truth. It is towards the nature-bond of sensitive solidarity with earth, and flowers, and trees, the life that “rolls through all things,” not towards the spiritual unity which broods over the world and “impels all thinking things,” that these immersions in the selfless universe lead us.

What Hegel chiefly sees in these phenomena is their indication, even on the natural side of man, of that ideality of the material, which it is the work of intelligence to produce in the more spiritual life, in the fully-developed mind. The latter is the supreme over-soul, that Absolute Mind which in our highest moods, aesthetic and religious, we approximate to. But mind, as it tends towards the higher end to “merge itself in light,” to identify itself yet not wholly lost, but retained, in the fullness of undivided intellectual being, so at the lower end it springs from a natural and underlying unity, the immense solidarity of nether-soul, the great Soul of Nature — the “Substance” which is to be raised into the “Subject” which is true divinity. Between these two unities, the nature-given nether-soul and the spirit-won over-soul, lies the conscious life of man: a process of differentiation which narrows and of redintegration which enlarges, — which alternately builds up an isolated personality and dissolves it in a common intelligence and sympathy. It is because mental or tacit “suggestion”[88] (i.e. will-influence exercised without word or sign, or other sensible mode of connexion), thought-transference, or thought-reading (which is more than dexterous apprehension of delicate muscular signs), exteriorisation or transposition of sensibility into objects primarily non-sensitive, clairvoyance (i.e. the power of describing, as if from direct perception, objects or events removed in space beyond the recognised limits of sensation), and somnambulism, so far as it implies lucid vision with sealed eyes, — it is because these things seem to show the essential ideality of matter, that Hegel is interested in them. The

ordinary conditions of consciousness and even of practical life in society are a derivative and secondary state; a product of processes of individualism, which however are never completed, and leave a large margin for idealising intelligence to fulfil. From a state which is not yet personality to a state which is more than can be described as personality — lies the mental movement. So Fichte, too, had regarded the power of the somnambulist as laying open a world underlying the development of egoity and self-consciousness[89]: "the merely sensuous man is still in somnambulism," only a somnambulism of waking hours: "the true waking is the life in God, to be free in him, all else is sleep and dream." "Egoity," he adds, "is a merely *formal* principle, utterly, and never qualitative (i.e. the essence and universal force)." For Schopenhauer, too, the experiences of animal magnetism had seemed to prove the absolute supernatural power of the radical will in its superiority to the intellectual categories of space, time, and causal sequence: to prove the reality of the metaphysical which is at the basis of all conscious divisions.

(iii.) The Development of Inner Freedom.

The result of the first range in the process of psycho-genesis was to make the body a sign and utterance of the Soul, with a fixed and determinate type. The "anthropological process" has defined and settled the mere general sentiency of soul into an individualised shape, a localised and limited self, a bundle of habits. It has made the soul an Ego or self: a power which looks out upon the world as a spectator, lifted above immanence in the general tide of being, but only so lifted because it has made itself one in the world of objects, a thing among things. The Mind has reached the point of view of reflection. Instead of a general identifiability with all nature, it has encased itself in a limited range, from which it looks forth on what is now other than itself. If previously it was mere inward sensibility, it is now sense,

perceptive of an object here and now, of an external world. The step has involved some price: and that price is, that it has attained independence and self-hood at the cost of surrendering the content it had hitherto held in one with itself. It is now a blank receptivity, open to the impressions of an outside world: and the changes which take place in its process of apprehension seem to it to be given from outside. The world it perceives is a world of isolated and independent objects: and it takes them as they are given. But a closer insistance on the perception develops the implicit intelligence, which makes it possible. The percipient mind is no mere recipiency or susceptibility with its forms of time and space: it is spontaneously active, it is the source of categories, or is an apperceptive power, — an understanding. Consciousness, thus discovered to be a creative or constructive faculty, is strictly speaking self-consciousness[90].

Self-consciousness appears at first in the selfish or narrowly egoistic form of appetite and impulse. The intelligence which claims to mould and construe the world of objects — which, in Kant's phrase, professes to give us nature — is implicitly the lord of that world. And that supremacy it carries out as appetite — as destruction. The self is but a bundle of wants — its supremacy over things is really subjection to them: the satisfaction of appetite is baffled by a new desire which leaves it as it was before. The development of self-consciousness to a more adequate shape is represented by Hegel as taking place through the social struggle for existence. Human beings, too, are in the first instance to the uninstructed appetite or the primitive self-consciousness (which is simply a succession of individual desires for satisfaction of natural want) only things, — adjectival to that self's individual existence. To them, too, his primary relation is to appropriate and master them. Might precedes right. But the social struggle for existence forces him to recognise something other which is kindred to himself, — a limiting principle, another self which has to form an element

in his calculations, not to be neglected. And gradually, we may suppose, the result is the division of humanity into two levels, a ruling lordly class, and a class of slaves, — a state of inequality in which each knows that his appetite is in some measure checked by a more or less permanent other. Lastly, perhaps soonest in the inferior order, there is fashioned the perception that its self-seeking in its isolated appetites is subject to an abiding authority, a continuing consciousness. There grows up a social self — a sense of general humanity and solidarity with other beings — a larger self with which each identifies himself, a common ground. Understanding was selfish intelligence: practical in the egoistic sense. In the altruistic or universal sense practical, a principle social and unifying character, intelligence is Reason.

Thus, Man, beginning as a percipient consciousness, apprehending single objects in space and time, and as an appetitive self bent upon single gratifications, has ended as a rational being, — a consciousness purged of its selfishness and isolation, looking forward openly and impartially on the universe of things and beings. He has ceased to be a mere animal, swallowed up in the moment and the individual, using his intelligence only in selfish satisfactions. He is no longer bound down by the struggle for existence, looking on everything as a mere thing, a mere means. He has erected himself above himself and above his environment, but that because he occupies a point of view at which he and his environment are no longer purely antithetical and exclusive[91]. He has reached what is really the moral standpoint: the point i.e. at which he is inspired by a universal self-consciousness, and lives in that peaceful world where the antitheses of individualities and of outward and inward have ceased to trouble. "The natural man," says Hegel[92], "sees in the woman flesh of his flesh: the moral and spiritual man sees spirit of his spirit in the moral and spiritual being and by its means." Hitherto we have been dealing with something falling below

the full truth of mind: the region of immediate sensibility with its thorough immersion of mind in body, first of all, and secondly its gradual progress to a general standpoint. It is only in the third part of Subjective mind that we are dealing with the psychology of a being who in the human sense knows and wills, i.e. apprehends general truth, and carries out ideal purposes.

Thus, for the third time, but now on a higher plane, that of intelligence and rationality, is traced the process of development or realisation by which reason becomes reasoned knowledge and rational will, a free or autonomous intelligence. And, as before, the starting-point, alike in theoretical and practical mind, is feeling — or immediate knowledge and immediate sense of Ought. The basis of thought is an immediate perception — a sensuous affection or given something, and the basis of the idea of a general satisfaction is the natural claim to determine the outward existence conformably to individual feeling. In intelligent perception or intuition the important factor is attention, which raises it above mere passive acceptance and awareness of a given fact. Attention thus involves on one hand the externality of its object, and on the other affirms its dependence on the act of the subject: it sets the objects before and out of itself, in space and time, but yet in so doing it shows itself master of the objects. If perception presuppose attention, in short, they cease to be wholly outward: we make them ours, and the space and time they fill are projected by us. So attended to, they are appropriated, inwardised and recollected: they take their place in a mental place and mental time: they receive a general or de-individualised character in the memory-image. These are retained as mental property, but retained actually only in so far they are revivable and revived. Such revival is the work of imagination working by the so-called laws of association. But the possession of its ideas thus inwardised and recollected by the mind is largely a matter of chance. The mind is not really fully master of them until it has been able to give them a certain objectivity, by

replacing the mental image by a vocal, i.e. a sensible sign. By means of words, intelligence turns its ideas or representations into quasi-realities: it creates a sort of superior sense-world, the world of language, where ideas live a potential, which is also an actual, life. Words are sensibles, but they are sensibles which completely lose themselves in their meaning. As sensibles, they render possible that verbal memory which is the handmaid of thought: but which also as merely mechanical can leave thought altogether out of account. It is through words that thought is made possible: for it alone permits the movement through ideas without being distracted through a multitude of associations. In them thought has an instrument completely at its own level, but still only a machine, and in memory the working of that machine. We think in names, not in general images, but in terms which only serve as vehicles for mental synthesis and analysis.

It is as such a thinking being — a being who can use language, and manipulate general concepts or take comprehensive views, that man is a rational will. A concept of something to be done — a feeling even of some end more or less comprehensive in its quality, is the implication of what can be called will. At first indeed its material may be found as immediately given and all its volitionality may lie in the circumstance that the intelligent being sets this forward as a governing and controlling Ought. Its vehicle, in short, may be mere impulse, or inclination, and even passion: but it is the choice and the purposive adoption of means to the given end. Gradually it attains to the idea of a general satisfaction, or of happiness. And this end seems positive and definite. It soon turns out however to be little but a prudent and self-denying superiority to particular passions and inclinations in the interest of a comprehensive ideal. The free will or intelligence has so far only a negative and formal value: it is the perfection of an autonomous and freely self-developing mind. Such a mind, which in language has acquired the means of realising an intellectual system of things superior to

the restrictions of sense, and which has emancipated reason from the position of slave to inclination, is endued with the formal conditions of moral conduct. Such a mind will transform its own primarily physical dependence into an image of the law of reason and create the ethical life: and in the strength of that establishment will go forth to conquer the world into a more and more adequate realisation of the eternal Idea.

Essay V. Ethics And Politics.

"In dealing," says Hegel, "with the Idea of the State, we must not have before our eyes a particular state, or a particular institution: we must rather study the Idea, this actual God, on his own account. Every State, however bad we may find it according to our principles, however defective we may discover this or that feature to be, still contains, particularly if it belongs to the mature states of our time, all the essential factors of its existence. But as it is easier to discover faults than to comprehend the affirmative, people easily fall into the mistake of letting individual aspects obscure the intrinsic organism of the State itself. The State is no ideal work of art: it stands in the everyday world, in the sphere, that is, of arbitrary act, accident, and error, and a variety of faults may mar the regularity of its traits. But the ugliest man, the criminal, a sick man and a cripple, is after all a living man; the affirmative, Life, subsists in spite of the defect: and this affirmative is here the theme[93]." "It is the theme of philosophy," he adds, "to ascertain the substance which is immanent in the show of the temporal and transient, and the eternal which is present."

(i.) Hegel as a Political Critic.

But if this is true, it is also to be remembered that the philosopher is, like other men, the son of his age, and estimates the value of reality from preconceptions and aspirations due to his generation. The historical circumstances of his nation as well as the personal experiences of his life help to determine his horizon, even in the effort to discover the hidden pulse

and movement of the social organism. This is specially obvious in political philosophy. The conception of ethics and politics which is presented in the *Encyclopaedia* was in 1820 produced with more detail as the *Grundlinien der Philosophie des Rechts*. Appearing, as it did, two years after his appointment to a professorship at Berlin, and in the midst of a political struggle between the various revolutionary and conservative powers and parties of Germany, the book became, and long remained, a target for embittered criticism. The so-called War of Liberation or national movement to shake off the French yoke was due to a coalition of parties, and had naturally been in part supported by tendencies and aims which went far beyond the ostensive purpose either of leaders or of combatants. Aspirations after a freer state were entwined with radical and socialistic designs to reform the political hierarchy of the Fatherland: high ideals and low vulgarities were closely intermixed: and the noble enthusiasm of youth was occasionally played on by criminal and anarchic intriguers. In a strong and wise and united Germany some of these schemes might have been tolerated. But strength, wisdom, and unity were absent. In the existing tension between Austria and Prussia for the leadership, in the ill-adapted and effete constitutions of the several principalities which were yet expected to realise the advance which had taken place in society and ideas during the last thirty years, the outlook on every hand seemed darker and more threatening than it might have otherwise done. Governments, which had lost touch with their peoples, suspected conspiracy and treason: and a party in the nation credited their rulers with gratuitous designs against private liberty and rights. There was a vast but ill-defined enthusiasm in the breasts of the younger world, and it was shared by many of their teachers. It seemed to their immense aspirations that the war of liberation had failed of its true object and left things much as they were. The volunteers had not fought for the political systems of Austria or Prussia, or for the three-and-

thirty princes of Germany: but for ideas, vague, beautiful, stimulating. To such a mood the continuance of the old system was felt as a cruel deception and a reaction. The governments on their part had not realised the full importance of the spirit that had been aroused, and could not at a moment's notice set their house in order, even had there been a clearer outlook for reform than was offered. They too had suffered, and had realised their insecurity: and were hardly in a mood to open their gates to the enemy.

Coming on such a situation of affairs, Hegel's book would have been likely in any case to provoke criticism. For it took up a line of political theory which was little in accord with the temper of the age. The conception of the state which it expounded is not far removed in essentials from the conception which now dominates the political life of the chief European nations. But in his own time it came upon ears which were naturally disposed to misconceive it. It was unacceptable to the adherents of the *ancien régime*, as much as to the liberals. It was declared by one party to be a glorification of the Prussian state: by another to rationalise the sanctities of authority. It was pointed out that the new professor was a favourite of the leading minister, that his influence was dominant in scholastic appointments, and that occasional gratuities from the crown proved his acceptability. A contemporary professor, Fries, remarked that Hegel's theory of the state had grown "not in the gardens of science but on the dung-hill of servility." Hegel himself was aware that he had planted a blow in the face of a "shallow and pretentious sect," and that his book had "given great offence to the demagogic folk." Alike in religious and political life he was impatient of sentimentalism, of rhetorical feeling, of wordy enthusiasm. A positive storm of scorn burst from him at much-promising and little-containing declamation that appealed to the pathos of ideas, without sense of the complex work of construction and the system of principles which were needed to give them reality. His impatience of demagogic gush led

him (in the preface) into a tactless attack on Fries, who was at the moment in disgrace for his participation in the demonstration at the Wartburg. It led him to an attack on the bumptiousness of those who held that conscientious conviction was ample justification for any proceeding: — an attack which opponents were not unwilling to represent as directed against the principle of conscience itself.

Yet Hegel's views on the nature of political unity were not new. Their nucleus had been formed nearly twenty years before. In the years that immediately followed the French revolution he had gone through the usual anarchic stage of intelligent youth. He had wondered whether humanity might not have had a nobler destiny, had fate given supremacy to some heresy rather than the orthodox creed of Christendom. He had seen religion in the past "teaching what despotism wished, — contempt of the human race, its incapacity for anything good[94]." But his earliest reflections on political power belong to a later date, and are inspired, not so much by the vague ideals of humanitarianism, as by the spirit of national patriotism. They are found in a "Criticism of the German Constitution" apparently dating from the year 1802[95]. It is written after the peace of Lunéville had sealed for Germany the loss of her provinces west of the Rhine, and subsequent to the disasters of the German arms at Hohenlinden and Marengo. It is almost contemporaneous with the measures of 1803 and 1804, which affirmed the dissolution of the "Holy Roman Empire" of German name. The writer of this unpublished pamphlet sees his country in a situation almost identical with that which Macchiavelli saw around him in Italy. It is abused by petty despots, distracted by mean particularist ambitions, at the mercy of every foreign power. It was such a scene which, as Hegel recalls, had prompted and justified the drastic measures proposed in the *Prince*, — measures which have been ill-judged by the closet moralist, but evince the high statesmanship of the Florentine. In the *Prince*,

an intelligent reader can see "the enthusiasm of patriotism underlying the cold and dispassionate doctrines." Macchiavelli dared to declare that Italy must become a state, and to assert that "there is no higher duty for a state than to maintain itself, and to punish relentlessly every author of anarchy, — the supreme, and perhaps sole political crime." And like teaching, Hegel adds, is needed for Germany. Only, he concludes, no mere demonstration of the insanity of utter separation of the particular from his kin will ever succeed in converting the particularists from their conviction of the absoluteness of personal and private rights. "Insight and intelligence always excite so much distrust that force alone avails to justify them; then man yields them obedience[96]."

"The German political edifice," says the writer, "is nothing else but the sum of the rights which the single parts have withdrawn from the whole; and this justice, which is ever on the watch to prevent the state having any power left, is the essence of the constitution." The Peace of Westphalia had but served to constitute or stereotype anarchy: the German empire had by that instrument divested itself of all rights of political unity, and thrown itself on the goodwill of its members. What then, it may be asked, is, in Hegel's view, the indispensable minimum essential to a state? And the answer will be, organised strength, — a central and united force. "The strength of a country lies neither in the multitude of its inhabitants and fighting men, nor in its fertility, nor in its size, but solely in the way its parts are by reasonable combination made a single political force enabling everything to be used for the common defence." Hegel speaks scornfully of "the philanthropists and moralists who decry politics as an endeavour and an art to seek private utility at the cost of right": he tells them that "it is foolish to oppose the interest or (as it is expressed by the more morally-obnoxious word) the utility of the state to its right": that the "rights of a state are the utility of the state as established and recognised by compacts":

and that "war" (which they would fain abolish or moralise) "has to decide not which of the rights asserted by either party is the true right (— for both parties have a true right), but which right has to give way to the other."

It is evident from these propositions that Hegel takes that view of political supremacy which has been associated with the name of Hobbes. But his views also reproduce the Platonic king of men, "who can rule and dare not lie." "All states," he declares, "are founded by the sublime force of great men, not by physical strength. The great man has something in his features which others would gladly call their lord. They obey him against their will. Their immediate will is his will, but their conscious will is otherwise.... This is the prerogative of the great man to ascertain and to express the absolute will. All gather round his banner. He is their God." "The state," he says again, "is the self-certain absolute mind which recognises no definite authority but its own: which acknowledges no abstract rules of good and bad, shameful and mean, craft and deception." So also Hobbes describes the prerogatives of the sovereign Leviathan. But the Hegelian God immanent in the state is a higher power than Hobbes knows: he is no mortal, but in his truth an immortal God. He speaks by (what in this early essay is called) the Absolute Government[97]: the government of the Law — the true impersonal sovereign, — distinct alike from the single ruler and the multitude of the ruled. "It is absolutely only universality as against particular. As this absolute, ideal, universal, compared to which everything else is a particular, it is the phenomenon of God. Its words are his decision, and it can appear and exist under no other form.... The Absolute government is divine, self-sanctioned and not made[98]." The real strength — the real connecting-mean which gives life to sovereign and to subject — is intelligence free and entire, independent both of what individuals feel and believe and of the quality of the ruler. "The spiritual bond," he says in a lower form of speech, "is public opinion: it is the true legislative body,

national assembly, declaration of the universal will which lives in the execution of all commands." This still small voice of public opinion is the true and real parliament: not literally making laws, but revealing them. If we ask, where does this public opinion appear and how does it disengage itself from the masses of partisan judgment? Hegel answers, — and to the surprise of those who have not entered into the spirit of his age[99] — it is embodied in the Aged and the Priests. Both of these have ceased to live in the real world: they are by nature and function disengaged from the struggles of particular existence, have risen above the divergencies of social classes. They breathe the ether of pure contemplation. "The sunset of life gives them mystical lore," or at least removes from old age the distraction of selfishness: while the priest is by function set apart from the divisions of human interest. Understood in a large sense, Hegel's view is that the real voice of experience is elicited through those who have attained indifference to the distorting influence of human parties, and who see life steadily and whole.

If this utterance shows the little belief Hegel had in the ordinary methods of legislation through "representative" bodies, and hints that the real *substance* of political life is deeper than the overt machinery of political operation, it is evident that this theory of "divine right" is of a different stamp from what used to go under that name. And, again, though the power of the central state is indispensable, he is far from agreeing with the so-called bureaucratic view that "a state is a machine with a single spring which sets in motion all the rest of the machinery." "Everything," he says, "which is not directly required to organise and maintain the force for giving security without and within must be left by the central government to the freedom of the citizens. Nothing ought to be so sacred in the eyes of a government as to leave alone and to protect, without regard to utilities, the free action of the citizens in such matters as do not affect its fundamental

aim: for this freedom is itself sacred[100]." He is no friend of paternal bureaucracy. "The pedantic craving to settle every detail, the mean jealousy against estates and corporations administrating and directing their own affairs, the base fault-finding with all independent action on the part of the citizens, even when it has no immediate bearing on the main political interest, has been decked out with reasons to show that no penny of public expenditure, made for a country of twenty or thirty millions' population, can be laid out, without first being, not permitted, but commanded, controlled and revised by the supreme government." You can see, he remarks, in the first village after you enter Prussian territory the lifeless and wooden routine which prevails. The whole country suffers also from the way religion has been mixed up with political rights, and a particular creed pronounced by law indispensable both for sovereign and full-privileged subject. In a word, the unity and vigour of the state is quite compatible with considerable latitude and divergence in laws and judicature, in the imposition and levying of taxes, in language, manners, civilisation and religion. Equality in all these points is desirable for social unity: but it is not indispensable for political strength.

This decided preference for the unity of the state against the system of checks and counterchecks, which sometimes goes by the name of a constitution, came out clearly in Hegel's attitude in discussing the dispute between the Würtembergers and their sovereign in 1815-16. Würtemberg, with its complicated aggregation of local laws, had always been a paradise of lawyers, and the feudal rights or privileges of the local oligarchies — the so-called "good old law" — were the boast of the country. All this had however been aggravated by the increase of territory received in 1805: and the king, following the examples set by France and even by Bavaria, promulgated of his own grace a "constitution" remodelling the electoral system of the country. Immediately an outcry burst out against the attempt

to destroy the ancient liberties. Uhland tuned his lyre to the popular cry: Rückert sang on the king's side. To Hegel the contest presented itself as a struggle between the attachment to traditional rights, merely because they are old, and the resolution to carry out reasonable reform whether it be agreeable to the reformed or not: or rather he saw in it resistance of particularism, of separation, clinging to use and wont, and basing itself on formal pettifogging objections, against the spirit of organisation. Anything more he declined to see. And probably he was right in ascribing a large part of the opposition to inertia, to vanity and self-interest, combined with the want of political perception of the needs of Würtemberg and Germany. But on the other hand, he failed to remember the insecurity and danger of such "gifts of the Danai": he forgot the sense of free-born men that a constitution is not something to be granted (*octroyé*) as a grace, but something that must come by the spontaneous act of the innermost self of the community. He dealt rather with the formal arguments which were used to refuse progress, than with the underlying spirit which prompted the opposition[101].

The philosopher lives (as Plato has well reminded us) too exclusively within the ideal. Bent on the essential nucleus of institutions, he attaches but slight importance to the variety of externals, and fails to realise the practice of the law-courts. He forgets that what weighs lightly in logic, may turn the scale in real life and experience. For feeling and sentiment he has but scant respect: he is brusque and uncompromising: and cannot realise all the difficulties and dangers that beset the Idea in the mazes of the world, and may ultimately quite alter a plan which at first seemed independent of petty details. Better than other men perhaps he recognises in theory how the mere universal only exists complete in an individual shape: but more than other men he forgets these truths of insight, when the business of life calls for action or for judgment. He cannot at a moment's notice remember that he is, if not, as Cicero says, *in faece Romuli*, the member of a degenerate

commonwealth, at least living in a world where good and evil are not, as logic presupposes, sharply divided but intricately intertwined.

(ii.) The Ethics and Religion of the State.

This idealism of political theory is illustrated by the sketch of the Ethical Life which he drew up about 1802. Under the name of "Ethical System" it presents in concentrated or undeveloped shape the doctrine which subsequently swelled into the "Philosophy of Mind." At a later date he worked out more carefully as introduction the psychological genesis of moral and intelligent man, and he separated out more distinctly as a sequel the universal powers which give to social life its higher characters. In the earlier sketch the Ethical Part stands by itself, with the consequence that Ethics bears a meaning far exceeding all that had been lately called moral. The word "moral" itself he avoids[102]. It savours of excessive subjectivity, of struggle, of duty and conscience. It has an ascetic ring about it — an aspect of negation, which seeks for abstract holiness, and turns its back on human nature. Kant's words opposing duty to inclination, and implying that moral goodness involves a struggle, an antagonism, a victory, seem to him (and to his time) one-sided. That aspect of negation accordingly which Kant certainly began with, and which Schopenhauer magnified until it became the all-in-all of Ethics, Hegel entirely subordinates. Equally little does he like the emphasis on the supremacy of insight, intention, conscience: they lead, he thinks, to a view which holds the mere fact of conviction to be all-important, as if it mattered not what we thought and believed and did, so long as we were sincere in our belief. All this emphasis on the good-will, on the imperative of duty, on the rights of conscience, has, he admits, its justification in certain circumstances, as against mere legality, or mere natural instinctive goodness; but it has been overdone. Above all, it errs by

an excess of individualism. It springs from an attitude of reflection, — in which the individual, isolated in his conscious and superficial individuality, yet tries — but probably tries in vain — to get somewhat in touch with a universal which he has allowed to slip outside him, forgetting that it is the heart and substance of his life. Kant, indeed, hardly falls under this condemnation. For he aims at showing that the rational will inevitably creates as rational a law or universal; that the individual act becomes self-regulative, and takes its part in constituting a system or realm of duty.

Still, on the whole, "morality" in this narrower sense belongs to an age of reflection, and is formal or nominal goodness rather than the genuine and full reality. It is the protest against mere instinctive or customary virtue, which is but compliance with traditional authority, and compliance with it as if it were a sort of quasi-natural law. Moralising reflection is the awakening of subjectivity and of a deeper personality. The age which thus precedes morality is not an age in which kindness, or love, or generosity is unknown. And if Hegel says that "Morality," strictly so called, began with Socrates, he does not thereby accuse the pre-Socratic Greeks of inhumanity. But what he does say is that such ethical life as existed was in the main a thing of custom and law: of law, moreover, which was not set objectively forward, but left still in the stage of uncontradicted usage, a custom which was a second nature, part of the essential and quasi-physical ordinance of life. The individual had not yet learned to set his self-consciousness against these usages and ask for their justification. These are like the so-called law of the Medes and Persians which alters not: customs of immemorial antiquity and unquestionable sway. They are part of a system of things with which for good or evil the individual is utterly identified, bound as it were hand and foot. These are, as a traveller says[103], "oral and unwritten traditions which teach that certain rules of conduct are to be observed under certain penalties; and without the aid of fixed records, or the intervention of

a succession of authorised depositaries and expounders, these laws have been transmitted to father and son, through unknown generations, and are fixed in the minds of the people as sacred and unalterable."

The antithesis then in Hegel, as in Kant, is between Law and Morality, or rather Legality and Morality, — two abstractions to which human development is alternately prone to attach supreme importance. The first stage in the objectivation of intelligence or in the evolution of personality is the constitution of mere, abstract, or strict right. It is the creation of institutions and uniformities, i.e. of laws, or rights, which express definite and stereotyped modes of behaviour. Or, if we look at it from the individual's standpoint, we may say his consciousness awakes to find the world parcelled out under certain rules and divisions, which have objective validity, and govern him with the same absolute authority as do the circumstances of physical nature. Under their influence every rank and individual is alike forced to bow: to each his place and function is assigned by an order or system which claims an inviolable and eternal supremacy. It is not the same place and function for each: but for each the position and duties are predetermined in this metaphysically-physical order. The situation and its duties have been created by super-human and natural ordinance. As the Platonic myth puts it, each order in the social hierarchy has been framed underground by powers that turned out men of gold, and silver, and baser metal: or as the Norse legend tells, they are the successive offspring of the white God, Heimdal, in his dealings with womankind.

The central idea of the earlier social world is the supremacy of rights — but not of right. The sum (for it cannot be properly called a system) of rights is a self-subsistent world, to which man is but a servant; and a second peculiarity of it is its inequality. If all are equal before the laws, this only means here that the laws, with their absolute and thorough inequality, are indifferent to the real and personal diversities of individuals. Even the so-

called equality of primitive law is of the “Eye-for-eye, Tooth-for-tooth” kind; it takes no note of special circumstances; it looks abstractly and rudely at facts, and maintains a hard and fast uniformity, which seems the height of unfairness. Rule stands by rule, usage beside usage, — a mere aggregate or multitude of petty tyrants, reduced to no unity or system, and each pressing with all the weight of an absolute mandate. The pettiest bit of ceremonial law is here of equal dignity with the most far-reaching principle of political obligation.

In the essay already referred to, Hegel has designated something analogous to this as Natural or Physical Ethics, or as Ethics in its relative or comparative stage. Here Man first shows his superiority to nature, or enters on his properly ethical function, by transforming the physical world into his possession. He makes himself the lord of natural objects — stamping them as his, and not their own, making them his permanent property, his tools, his instruments of exchange and production. The fundamental ethical act is appropriation by labour, and the first ethical world is the creation of an economic system, the institution of property. For property, or at least possession and appropriation, is the dominant idea, with its collateral and sequent principles. And at first, even human beings are treated on the same method as other things: as objects in a world of objects or aggregate of things: as things to be used and acquired, as means and instruments, — not in any sense as ends in themselves. It is a world in which the relation of master and slave is dominant, — where owner and employer is set in antithesis against his tools and chattels. But the Nemesis of his act issues in making the individual the servant of his so-called property. He has become an objective power by submitting himself to objectivity: he has literally put himself into the object he has wrought, and is now a thing among things: for what he owns, what he has appropriated, determines what he is. The real powers in the world thus established are the laws of possession-holding: the

laws dominate man: and he is only freed from dependence on casual externals, by making himself thoroughly the servant of his possessions.

The only salvation, and it is but imperfect, that can be reached on this stage is by the family union. The sexual tie, is at first entirely on a level with the other arrangements of the sphere. The man or woman is but a chattel and a tool; a casual appropriation which gradually is transformed into a permanent possession and a permanent bond[104]. But, as the family constituted itself, it helped to afford a promise of better things. An ideal interest — the religion of the household — extending beyond the individual, and beyond the moment, — binding past and present, and parents to offspring, gave a new character to the relation of property. Parents and children form a unity, which overrides and essentially permeates their "difference" from each other: there is no exchange, no contract, nor, in the stricter sense, property between the members. In the property-idea they are lifted out of their isolation, and in the continuity of family life there is a certain analogue of immortality. But, says Hegel, "though the family be the highest totality of which Nature is capable, the absolute identity is in it still inward, and is not instituted in absolute form; and hence, too, the reproduction of the totality is an appearance, the appearance of the children[105]." "The power and the intelligence, the 'difference' of the parents, stands in inverse proportion to the youth and vigour of the child: and these two sides of life flee from and are sequent on each other, and are reciprocally external[106]." Or, as we may put it, the god of the family is a departed ancestor, a ghost in the land of the dead: it has not really a continuous and unified life. In such a state of society — a state of nature — and in its supreme form, the family, there is no adequate principle which though real shall still give ideality and unity to the self-isolating aspects of life. There is wanted something which shall give expression to its "indifference," which shall control the tendency of this partial moralisation

to sink at every moment into individuality, and lift it from its immersion in nature. Family life and economic groups (— for these two, which Hegel subsequently separates, are here kept close together) need an ampler and wider life to keep them from stagnating in their several selfishnesses.

This freshening and corrective influence they get in the first instance from deeds of violence and crime. Here is the "negative unsettling" of the narrow fixities, of the determinate conditions or relationships into which the preceding processes of labour and acquisition have tended to stereotype life. The harsh restriction brings about its own undoing. Man may subject natural objects to his formative power, but the wild rage of senseless devastation again and again bursts forth to restore the original formlessness. He may build up his own pile of wealth, store up his private goods, but the thief and the robber with the instincts of barbarian socialism tread on his steps: and every stage of appropriation has for its sequel a crop of acts of dispossession. He may secure by accumulation his future life; but the murderer for gain's sake cuts it short. And out of all this as a necessary consequence stands avenging justice. And in the natural world of ethics — where true moral life has not yet arisen — this is mere retaliation or the *lex talionis*; — the beginning of an endless series of vengeance and counter-vengeance, the blood-feud. Punishment, in the stricter sense of the term, — which looks both to antecedents and effects in character — cannot yet come into existence; for to punish there must be something superior to individualities, an ethical idea embodied in an institution, to which the injurer and the injured alike belong. But as yet punishment is only vengeance, the personal and natural equivalent, the physical reaction against injury, perhaps regulated and formulated by custom and usage, but not essentially altered from its purely retaliatory character. These crimes — or transgressions — are thus by Hegel quaintly conceived as storms which clear the air — which shake the individualist out of his slumber. The scene

in which transgression thus acts is that of the so-called state of nature, where particularism was rampant: where moral right was not, but only the right of nature, of pre-occupation, of the stronger, of the first maker and discoverer. Crime is thus the "dialectic" which shakes the fixity of practical arrangements, and calls for something in which the idea of a higher unity, a permanent substance of life, shall find realisation.

The "positive supersession[107]" of individualism and naturalism in ethics is by Hegel called "Absolute Ethics." Under this title he describes the ethics and religion of the state — a religion which is immanent in the community, and an ethics which rises superior to particularity. The picture he draws is a romance fashioned upon the model of the Greek commonwealth as that had been idealised by Greek literature and by the longings of later ages for a freer life. It is but one of the many modes in which Helena — to quote Goethe — has fascinated the German Faust. He dreams himself away from the prosaic worldliness of a German municipality to the unfading splendour of the Greek city with its imagined coincidence of individual will with universal purpose. There is in such a commonwealth no pain of surrender and of sacrifice, and no subsequent compensation: for, at the very moment of resigning self-will to common aims, he enjoys it retained with the added zest of self-expansion. He is not so left to himself as to feel from beyond the restraint of a law which controls — even if it wisely and well controls — individual effort. There is for his happy circumstances no possibility of doing otherwise. Or, it may be, Hegel has reminiscences from the ideals of other nations than the Greek. He recalls the Israelite depicted by the Law-adoring psalmist, whose delight is to do the will of the Lord, whom the zeal of God's house has consumed, whose whole being runs on in one pellucid stream with the universal and eternal stream of divine commandment. Such a frame of spirit, where the empirical consciousness with all its soul and strength and mind identifies its mission into conformity with the absolute

order, is the mood of absolute Ethics. It is what some have spoken of as the True life, as the Eternal life; in it, says Hegel, the individual exists *auf ewige Weise*[108], as it were *sub specie aeternitatis*: his life is hid with his fellows in the common life of his people. His every act, and thought, and will, get their being and significance from a reality which is established in him as a permanent spirit. It is there that he, in the fuller sense, attains αὐτάρκεια, or finds himself no longer a mere part, but an ideal totality. This totality is realised under the particular form of a Nation (*Volk*), which in the visible sphere represents (or rather is, as a particular) the absolute and infinite. Such a unity is neither the mere sum of isolated individuals, nor a mere majority ruling by numbers: but the fraternal and organic commonwealth which brings all classes and all rights from their particularistic independence into an ideal identity and indifference[109]. Here all are not merely equal before the laws: but the law itself is a living and organic unity, self-correcting, subordinating and organising, and no longer merely defining individual privileges and so-called liberties. "In such conjunction of the universal with the particularity lies the divinity of a nation: or, if we give this universal a separate place in our ideas, it is the God of the nation." But in this complete accordance between concept and intuition, between visible and invisible, where symbol and significate are one, religion and ethics are indistinguishable. It is the old conception (and in its highest sense) of Theocracy[110]. God is the national head and the national life: and in him all individuals have their "difference" rendered "indifferent." "Such an ethical life is absolute truth, for untruth is only in the fixture of a single mode: but in the everlasting being of the nation all singleness is superseded. It is absolute culture; for in the eternal is the real and empirical annihilation and prescription of all limited modality. It is absolute disinterestedness: for in the eternal there is nothing private and personal. It, and each of its movements, is the highest beauty: for beauty is

but the eternal made actual and given concrete shape. It is without pain, and blessed: for in it all difference and all pain is superseded. It is the divine, absolute, real, existing and being, under no veil; nor need one first raise it up into the ideality of divinity, and extract it from the appearance and empirical intuition; but it is, and immediately, absolute intuition[111]."

If we compare this language with the statement of the Encyclopaedia we can see how for the moment Hegel's eye is engrossed with the glory of the ideal nation. In it, the moral life embraces and is co-extensive with religion, art and science: practice and theory are at one: life in the idea knows none of those differences which, in the un-ideal world, make art and morality often antithetical, and set religion at variance with science. It is, as we have said, a memory of Greek and perhaps Hebrew ideals. Or rather it is by the help of such memories the affirmation of the essential unity of life — the true, complete, many-sided life — which is the presupposition and idea that culture and morals rest upon and from which they get their supreme sanction, i.e. their constitutive principle and unity. Even in the Encyclopaedia[112] Hegel endeavours to guard against the severance of morality and art and philosophy which may be rashly inferred in consequence of his serial order of treatment. "Religion," he remarks, "is the very substance of the moral life itself and of the state.... The ethical life is the divine spirit indwelling in consciousness, as it is actually present in a nation and its individual members." Yet, as we see, there is a distinction. The process of history carries out a judgment on nation after nation, and reveals the divine as not only immanent in the ethical life but as ever expanding the limited national spirit till it become a spirit of universal humanity. Still — and this is perhaps for each time always the more important — the national unity — not indeed as a multitude, nor as a majority — is the supreme real appearance of the Eternal and Absolute.

Having thus described the nation as an organic totality, he goes on to point out that the political constitution shows this character by forming a triplicity of political orders. In one of these there is but a silent, practical identity, in faith and trust, with the totality: in the second there is a thorough disruption of interest into particularity: and in the third, there is a living and intellectual identity or indifference, which combines the widest range of individual development with the completest unity of political loyalty. This last order is that which lives in conscious identification of private with public duty: all that it does has a universal and public function. Such a body is the ideal Nobility — the nobility which is the *servus servorum Dei*, the supreme servant of humanity. Its function is to maintain general interests, to give the other orders (peasantry and industrials) security, — receiving in return from these others the means of subsistence. *Noblesse oblige* gives the death-blow to particular interests, and imposes the duty of exhibiting, in the clearest form, the supreme reality of absolute morality, and of being to the rest an unperturbed ideal of aesthetic, ethical, religious, and philosophical completeness.

It is here alone, in this estate which is absolutely disinterested, that the virtues appear in their true light. To the ordinary moralising standpoint they seem severally to be, in their separation, charged with independent value. But from the higher point of view the existence, and still more the accentuation of single virtues, is a mark of incompleteness. Even quality, it has been said, involves its defects: it can only shine by eclipsing or reflecting something else. The completely moral is not the sum of the several virtues, but the reduction of them to indifference. It is thus that when Plato tries to get at the unity of virtue, their aspect of difference tends to be subordinated. “The movement of absolute morality runs through all the virtues, but settles fixedly in none.” It is more than love *to* fatherland, and nation, and laws: — that still implies a relation to something and

involves a difference. For love — the mortal passion, where "self is not annulled" — is the process of approximation, while unity is not yet attained, but wished and aimed at: and when it is complete — and become "such love as spirits know[113]" — it gives place to a calmer rest and an active immanence. The absolute morality is *life in* the fatherland and for the nation. In the individual however it is the process upward and inward that we see, not the consummation. Then the identity appears as an ideal, as a tendency not yet accomplished to its end, a possibility not yet made fully actual. At bottom — in the divine substance in which the individual inheres — the identity is present: but in the appearance, we have only the passage from possible to actual, a passage which has the aspect of a struggle. Hence the moral act appears as a virtue, with merit or desert. It is accordingly the very characteristic of virtue to signalise its own incompleteness: it emerges into actuality only through antagonism, and with a taint of imperfection clinging to it. Thus, in the field of absolute morality, if the virtues appear, it is only in their transiency. If they were undisputedly real in morality, they would not separately show. To feel that you have done well implies that you have not done wholly well: self-gratulation in meritorious deed is the re-action from the shudder at feeling that the self was not wholly good.

The essential unity of virtue — its negative character as regards all the empirical variety of virtues — is seen in the excellences required by the needs of war. These military requirements demonstrate the mere relativity and therefore non-virtuousness of the special virtues. They equally protest against the common beliefs in the supreme dignity of labour and its utilities. But if bravery or soldierlike virtue be essentially a virtue of virtues, it is only a negative virtue after all. It is the blast of the universal sweeping away all the habitations and fixed structures of particularist life. If it is a unity of virtue, it is only a negative unity — an indifference. If it avoid the parcelling of virtue into a number of imperfect and sometimes contradictory

parts, it does so only to present a bare negation. The soldier, therefore, if in potentiality the unity of all the virtues, may tend in practice to represent the ability to do without any of them[114].

The home of these "relative" virtues — of morality in the ordinary sense — is the life of the second order in the commonwealth: the order of industry and commerce. In this sphere the idea of the universal is gradually lost to view: it becomes, says Hegel, only a thought or a creature of the mind, which does not affect practice. The materialistic worker of civilisation does not see further than the empirical existence of individuals: his horizon is limited by the family, and his final ideal is a competency of comfort in possessions and revenues. The supreme universal to which he attains as the climax of his evolution is only money. But it is only with the vaster development of commerce that this terrible consequence ensues. At first as a mere individual, he has higher aims, though not the highest. He has a limited ideal determined by his special sphere of work. To win respect — the character for a limited truthfulness and honesty and skilful work — is his ambition. He lives in a conceit of his performance — his utility — the esteem of his special circle. To his commercial soul the military order is a scarecrow and a nuisance: military honour is but trash. Yet if his range of idea is narrow and engrossing in details, his aim is to get worship, to be recognised as the best in his little sphere. But with the growth of the trading spirit his character changes: he becomes the mere capitalist, is denationalised, has no definite work and can claim no individualised function. Money now measures all things: it is the sole ultimate reality. It transforms everything into a relation of contract: even vengeance is equated in terms of money. Its motto is, The Exchanges must be honoured, though honour and morality may go to the dogs. So far as it is concerned, there is no nation, but a federation of shopkeepers. Such an one is the *bourgeois* (the *Bürger*, as distinct from the peasant or *Bauer* and the *Adel*). As an

artisan — i.e. a mere industrial, he knows no country, but at best the reputation and interest of his own guild-union with its partial object. He is narrow, but honest and respectable. As a mere commercial agent, he knows no country: his field is the world, but the world not in its concreteness and variety, but in the abstract aspect of a money-bag and an exchange. The larger totality is indeed not altogether out of sight. But if he contribute to the needy, either his sacrifice is lifeless in proportion as it becomes general, or loses generality as it becomes lively. As regards his general services to the great life of his national state[115], they are unintelligently and perhaps grudgingly rendered.

Of the peasant order Hegel has less to say. On one side the "country" as opposed to the "town" has a closer natural sympathy with the common and general interest: and the peasantry is the undifferentiated, solid and sound, basis of the national life. It forms the submerged mass, out of which the best soldiers are made, and which out of the depths of earth brings forward nourishment as well as all the materials of elementary necessity. Faithfulness and loyalty are its virtues: but it is personal allegiance to a commanding superior, — not to a law or a general view — for the peasant is weak in comprehensive intelligence, though shrewd in detailed observation.

Of the purely political function of the state Hegel in this sketch says almost nothing. But under the head of the general government of the state he deals with its social functions. For a moment he refers to the well-known distinction of the legislative, judicial and executive powers. But it is only to remark that "in every governmental act all three are conjoined. They are abstractions, none of which can get a reality of its own, — which, in other words, cannot be constituted and organised as powers. Legislation, judicature, and executive are something completely formal, empty, and contentless.... Whether the others are or are not bare abstractions, empty

activities, depends entirely on the executive power; and this is absolutely the government[116]." Treating government as the organic movement by which the universal and the particular in the commonwealth come into relations, he finds that it presents three forms, or gives rise to three systems. The highest and last of these is the "educational" system. By this he understands all that activity by which the intelligence of the state tries directly to mould and guide the character and fortunes of its members: all the means of culture and discipline, whether in general or for individuals, all training to public function, to truthfulness, to good manners. Under the same head come conquest and colonisation as state agencies. The second system is the judicial, which instead of, like the former, aiming at the formation or reformation of its members is satisfied by subjecting individual transgression to a process of rectification by the general principle. With regard to the system of judicature, Hegel argues for a variety of procedure to suit different ranks, and for a corresponding modification of penalties. "Formal rigid equality is just what does not spare the character. The same penalty which in one estate brings no infamy causes in another a deep and irremediable hurt." And with regard to the after life of the transgressor who has borne his penalty: "Punishment is the reconciliation of the law with itself. No further reproach for his crime can be addressed to the person who has undergone his punishment. He is restored to membership of his estate[117]."

In the first of the three systems, the economic system, or "System of wants," the state seems at first hardly to appear in its universal and controlling function at all. Here the individual depends for the satisfaction of his physical needs on a blind, unconscious destiny, on the obscure and incalculable properties of supply and demand in the whole interconnexion of commodities. But even this is not all. With the accumulation of wealth in inequality, and the growth of vast capitals, there is substituted for the

dependence of the individual on the general resultant of a vast number of agencies a dependence on one enormously rich individual, who can control the physical destinies of a nation. But a nation, truly speaking, is there no more. The industrial order has parted into a mere abstract workman on one hand, and the *grande richesse* on the other. "It has lost its capacity of an organic absolute intuition and of respect for the divine — external though its divinity be: and there sets in the bestiality of contempt for all that is noble. The mere wisdomless universal, the mass of wealth, is the essential: and the ethical principle, the absolute bond of the nation, is vanished; and the nation is dissolved[118]."

It would be a long and complicated task to sift, in these ill-digested but profound suggestions, the real meaning from the formal statement. They are, like Utopia, beyond the range of practical politics. The modern reader, whose political conceptions are limited by contemporary circumstance, may find them archaic, medieval, quixotic. But for those who behind the words and forms can see the substance and the idea, they will perhaps come nearer the conception of ideal commonwealth than many reforming programmes. Compared with the maturer statements of the *Philosophy of Law*, they have the faults of the Romantic age to which their inception belongs. Yet even in that later exposition there is upheld the doctrine of the supremacy of the eternal State against everything particular, class-like, and temporary; a doctrine which has made Hegel — as it made Fichte — a voice in that "professorial socialism" which is at least as old as Plato.

Introduction.

§ 377. The knowledge of Mind is the highest and hardest, just because it is the most "concrete" of sciences. The significance of that "absolute"

commandment, *Know thyself* — whether we look at it in itself or under the historical circumstances of its first utterance — is not to promote mere self-knowledge in respect of the *particular* capacities, character, propensities, and foibles of the single self. The knowledge it commands means that of man's genuine reality — of what is essentially and ultimately true and real — of mind as the true and essential being. Equally little is it the purport of mental philosophy to teach what is called *knowledge of men* — the knowledge whose aim is to detect the *peculiarities*, passions, and foibles of other men, and lay bare what are called the recesses of the human heart. Information of this kind is, for one thing, meaningless, unless on the assumption that we know the *universal* — man as man, and, that always must be, as mind. And for another, being only engaged with casual, insignificant and *untrue* aspects of mental life, it fails to reach the underlying essence of them all — the mind itself.

§ 378. Pneumatology, or, as it was also called, Rational Psychology, has been already alluded to in the Introduction to the Logic as an *abstract* and generalising metaphysic of the subject. *Empirical* (or inductive) psychology, on the other hand, deals with the "concrete" mind: and, after the revival of the sciences, when observation and experience had been made the distinctive methods for the study of concrete reality, such psychology was worked on the same lines as other sciences. In this way it came about that the metaphysical theory was kept outside the inductive science, and so prevented from getting any concrete embodiment or detail: whilst at the same time the inductive science clung to the conventional common-sense metaphysic, with its analysis into forces, various activities, &c., and rejected any attempt at a "speculative" treatment.

The books of Aristotle on the Soul, along with his discussions on its special aspects and states, are for this reason still by far the most admirable,

perhaps even the sole, work of philosophical value on this topic. The main aim of a philosophy of mind can only be to re-introduce unity of idea and principle into the theory of mind, and so re-interpret the lesson of those Aristotelian books.

§ 379. Even our own sense of the mind's *living* unity naturally protests against any attempt to break it up into different faculties, forces, or, what comes to the same thing, activities, conceived as independent of each other. But the craving for a *comprehension* of the unity is still further stimulated, as we soon come across distinctions between mental freedom and mental determinism, antitheses between free *psychic* agency and the corporeity that lies external to it, whilst we equally note the intimate interdependence of the one upon the other. In modern times especially the phenomena of *animal magnetism* have given, even in experience, a lively and visible confirmation of the underlying unity of soul, and of the power of its "ideality." Before these facts, the rigid distinctions of practical common sense were struck with confusion; and the necessity of a "speculative" examination with a view to the removal of difficulties was more directly forced upon the student.

§ 380. The "concrete" nature of mind involves for the observer the peculiar difficulty that the several grades and special types which develop its intelligible unity in detail are not left standing as so many separate existences confronting its more advanced aspects. It is otherwise in external nature. There, matter and movement, for example, have a manifestation all their own — it is the solar system; and similarly the *differentiae* of sense-perception have a sort of earlier existence in the properties of *bodies*, and still more independently in the four elements. The species and grades of mental evolution, on the contrary, lose their separate existence and become factors, states and features in the higher grades of development. As a consequence of this, a lower and more abstract aspect of mind betrays the

presence in it, even to experience, of a higher grade. Under the guise of sensation, e.g., we may find the very highest mental life as its modification or its embodiment. And so sensation, which is but a mere form and vehicle, may to the superficial glance seem to be the proper seat and, as it were, the source of those moral and religious principles with which it is charged; and the moral and religious principles thus modified may seem to call for treatment as species of sensation. But at the same time, when lower grades of mental life are under examination, it becomes necessary, if we desire to point to actual cases of them in experience, to direct attention to more advanced grades for which they are mere forms. In this way subjects will be treated of by anticipation which properly belong to later stages of development (e.g. in dealing with natural awaking from sleep we speak by anticipation of consciousness, or in dealing with mental derangement we must speak of intellect).

What Mind (or Spirit) is.

§ 381. From our point of view Mind has for its *presupposition* Nature, of which it is the truth, and for that reason its *absolute prius*. In this its truth Nature is vanished, and mind has resulted as the "Idea" entered on possession of itself. Here the subject and object of the Idea are one — either is the intelligent unity, the notion. This identity is *absolute negativity* — for whereas in Nature the intelligent unity has its objectivity perfect but externalised, this self-externalisation has been nullified and the unity in that way been made one and the same with itself. Thus at the same time it is this identity only so far as it is a return out of nature.

§ 382. For this reason the essential, but formally essential, feature of mind is Liberty: i.e. it is the notion's absolute negativity or self-identity. Considered as this formal aspect, it *may* withdraw itself from everything external and from its own externality, its very existence; it can thus submit

to infinite *pain*, the negation of its individual immediacy: in other words, it can keep itself affirmative in this negativity and possess its own identity. All this is possible so long as it is considered in its abstract self-contained universality.

§ 383. This universality is also its determinate sphere of being. Having a being of its own, the universal is self-particularising, whilst it still remains self-identical. Hence the special mode of mental being is "*manifestation*." The spirit is not some one mode or meaning which finds utterance or externality only in a form distinct from itself: it does not manifest or reveal *something*, but its very mode and meaning is this revelation. And thus in its mere possibility Mind is at the same moment an infinite, "absolute," *actuality*.

§ 384. *Revelation*, taken to mean the revelation of the *abstract* Idea, is an unmediated transition to Nature which *comes* to be. As Mind is free, its manifestation is to *set forth* Nature as *its* world; but because it is reflection, it, in thus setting forth its world, at the same time *presupposes* the world as a nature independently existing. In the intellectual sphere to reveal is thus to create a world as its being — a being in which the mind procures the *affirmation* and *truth* of its freedom.

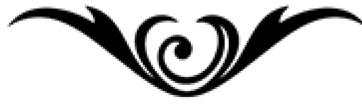
The Absolute is Mind (Spirit) — this is the supreme definition of the Absolute. To find this definition and to grasp its meaning and burthen was, we may say, the ultimate purpose of all education and all philosophy: it was the point to which turned the impulse of all religion and science: and it is this impulse that must explain the history of the world. The word "Mind" (Spirit) — and some glimpse of its meaning — was found at an early period: and the spirituality of God is the lesson of Christianity. It remains for philosophy in its own element of intelligible unity to get hold of what was thus given as a mental image, and what implicitly is the ultimate reality: and that problem is not genuinely, and by rational methods, solved

so long as liberty and intelligible unity is not the theme and the soul of philosophy.

Subdivision.

§ 385. The development of Mind (Spirit) is in three stages: —

(1) In the form of self-relation: within it it has the *ideal* totality of the Idea — i.e. it has before it all that its notion contains: its being is to be self-contained and free. This is *Mind Subjective*.



(2) In the form of *reality*: realised, i.e. in a *world* produced and to be produced by it: in this world freedom presents itself under the shape of necessity. This is *Mind Objective*.

(3) In that unity of mind as objectivity and, of mind as ideality and concept, which essentially and actually is and for ever produces itself, mind in its absolute truth. This is *Mind Absolute*.

§ 386. The two first parts of the doctrine of Mind embrace the finite mind. Mind is the infinite Idea; thus finitude here means the disproportion between the concept and the reality — but with the qualification that it is a shadow cast by the mind's own light — a show or illusion which the mind implicitly imposes as a barrier to itself, in order, by its removal, actually to realise and become conscious of freedom as *its* very being, i.e. to be fully *manifested*. The several steps of this activity, on each of which, with their semblance of being, it is the function of the finite mind to linger, and through which it has to pass, are steps in its liberation. In the full truth of that liberation is given the identification of the three stages — finding a world presupposed before us, generating a world as our own creation, and gaining freedom from it and in it. To the infinite form of this truth the show purifies itself till it becomes a consciousness of it.

A rigid application of the category of finitude by the abstract logician is chiefly seen in dealing with Mind and reason: it is held not a mere matter of strict logic, but treated also as a moral and religious concern, to adhere to the point of view of finitude, and the wish to go further is reckoned a mark of audacity, if not of insanity, of thought. Whereas in fact such a *modesty* of thought, as treats the finite as something altogether fixed and *absolute*, is the worst of virtues; and to stick to a post which has no sound ground in itself is the most unsound sort of theory. The category of finitude was at a much earlier period elucidated and explained at its place in the Logic: an elucidation which, as in logic for the more specific though still simple thought-forms of finitude, so in the rest of philosophy for the concrete forms, has merely to show that the finite *is not*, i.e. is not the truth, but merely a transition and an emergence to something higher. This finitude of the spheres so far examined is the dialectic that makes a thing have its cessation by another and in another: but Spirit, the intelligent unity and the *implicit* Eternal, is itself just the consummation of that internal act by which nullity is nullified and vanity is made vain. And so, the modesty alluded to is a retention of this vanity — the finite — in opposition to the true: it is itself therefore vanity. In the course of the mind's development we shall see this vanity appear as *wickedness* at that turning-point at which mind has reached its extreme immersion in its subjectivity and its most central contradiction.

Section I. Mind Subjective.

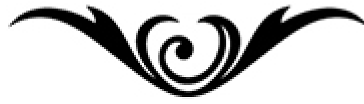
§ 387. MIND, on the ideal stage of its development, is mind as *cognitive*: Cognition, however, being taken here not as a merely logical category of the Idea (§ 223), but in the sense appropriate to the *concrete* mind.

Subjective mind is: —

(A) Immediate or implicit: a soul — the Spirit in *Nature* — the object treated by *Anthropology*.

(B) Mediate or explicit: still as identical reflection into itself and into other things: mind in correlation or particularisation: consciousness — the object treated by the *Phenomenology of Mind*.

(C) Mind defining itself in itself, as an independent subject — the object treated by *Psychology*.



In the Soul is the *awaking of Consciousness*: Consciousness sets itself up as Reason, awaking at one bound to the sense of its rationality: and this Reason by its activity emancipates itself to objectivity and the consciousness of its intelligent unity.

For an intelligible unity or principle of comprehension each modification it presents is an advance of *development*: and so in mind every character under which it appears is a stage in a process of specification and development, a step forward towards its goal, in order to make itself into, and to realise in itself, what it implicitly is. Each step, again, is itself such a process, and its product is that what the mind was implicitly at the beginning (and so for the observer) it is *for itself* — for the special form, viz. which the mind has in that step. The ordinary method of psychology is to narrate what the mind or soul is, what happens to it, what it does. The

soul is presupposed as a ready-made agent, which displays such features as its acts and utterances, from which we can learn what it is, what sort of faculties and powers it possesses — all without being aware that the act and utterance of what the soul is really invests it with that character in our conception and makes it reach a higher stage of being than it explicitly had before.

We must, however, distinguish and keep apart from the progress here studied what we call education and instruction. The sphere of education is the individual's only: and its aim is to bring the universal mind to exist in them. But in the philosophic theory of mind, mind is studied as self-instruction and self-education in very essence; and its acts and utterances are stages in the process which brings it forward to itself, links it in unity with itself, and so makes it actual mind.

Sub-Section A. Anthropology. The Soul.

§ 388. SPIRIT (Mind) *came into* being as the truth of Nature. But not merely is it, as such a result, to be held the true and real first of what went before: this becoming or transition bears in the sphere of the notion the special meaning of "*free judgment*." Mind, thus come into being, means therefore that Nature in its own self realises its untruth and sets itself aside: it means that Mind presupposes itself no longer as the universality which in corporal individuality is always self-externalised, but as a universality which in its concretion and totality is one and simple. At such a stage it is not yet mind, but *soul*.

§ 389. The soul is no separate immaterial entity. Wherever there is Nature, the soul is its universal immaterialism, its simple "ideal" life. Soul is the *substance* or "absolute" basis of all the particularising and individualising of mind: it is in the soul that mind finds the material on which its character is wrought, and the soul remains the pervading, identical ideality of it all. But as it is still conceived thus abstractly, the soul is only the *sleep* of mind — the passive νοῦς of Aristotle, which is potentially all things.

The question of the immateriality of the soul has no interest, except where, on the one hand, matter is regarded as something *true*, and mind conceived as a *thing*, on the other. But in modern times even the physicists have found matters grow thinner in their hands: they have come upon *imponderable* matters, like heat, light, &c., to which they might perhaps add space and time. These "imponderables," which have lost the property (peculiar to matter) of gravity and, in a sense, even the capacity of offering resistance, have still, however, a sensible existence and outness of part to

part; whereas the *“vital” matter*, which may also be found enumerated among them, not merely lacks gravity, but even every other aspect of existence which might lead us to treat it as material. The fact is that in the Idea of Life the self-externalism of nature is *implicitly* at an end: subjectivity is the very substance and conception of life — with this proviso, however, that its existence or objectivity is still at the same time forfeited to the sway of self-externalism. It is otherwise with Mind. There, in the intelligible unity which exists as freedom, as absolute negativity, and not as the immediate or natural individual, the object or the reality of the intelligible unity is the unity itself; and so the self-externalism, which is the fundamental feature of matter, has been completely dissipated and transmuted into universality, or the subjective ideality of the conceptual unity. Mind is the existent truth of matter — the truth that matter itself has no truth.

A cognate question is that of the *community of soul and body*. This community (interdependence) was assumed as a *fact*, and the only problem was how to *comprehend* it. The usual answer, perhaps, was to call it an *incomprehensible* mystery; and, indeed, if we take them to be absolutely antithetical and absolutely independent, they are as impenetrable to each other as one piece of matter to another, each being supposed to be found only in the pores of the other, i.e. where the other is not: whence Epicurus, when attributing to the gods a residence in the pores, was consistent in not imposing on them any connexion with the world. A somewhat different answer has been given by all philosophers since this relation came to be expressly discussed. Descartes, Malebranche, Spinoza, and Leibnitz have all indicated God as this *nexus*. They meant that the finitude of soul and matter were only ideal and unreal distinctions; and, so holding, these philosophers took God, not, as so often is done, merely as another word for the incomprehensible, but rather as the sole true identity of finite mind and

matter. But either this identity, as in the case of Spinoza, is too abstract, or, as in the case of Leibnitz, though his Monad of monads brings things into being, it does so only by an act of judgment or choice. Hence, with Leibnitz, the result is a distinction between soul and the corporeal (or material), and the identity is only like the *copula* of a judgment, and does not rise or develop into system, into the absolute syllogism.

§ 390. The Soul is at first —

(*a*) In its immediate natural mode — the natural soul, which only *is*.

(*b*) Secondly, it is a soul which *feels*, as individualised, enters into correlation with its immediate being, and, in the modes of that being, retains an abstract independence.

(*c*) Thirdly, its immediate being — or corporeity — is moulded into it, and with that corporeity it exists as *actual* soul.

(a) The Physical Soul[119].

§ 391. The soul universal, described, it may be, as an *anima mundi*, a world-soul, must not be fixed on that account as a single subject; it is rather the universal *substance* which has its actual truth only in individuals and single subjects. Thus, when it presents itself as a single soul, it is a single soul which *is* merely: its only modes are modes of natural life. These have, so to speak, behind its ideality a free existence: i.e. they are natural objects for consciousness, but objects to which the soul as such does not behave as to something external. These features rather are *physical qualities* of which it finds itself possessed.

(α) Physical Qualities[120].

§ 392. While still a "substance" (i.e. a physical soul) the mind (1) takes part in the general planetary life, feels the difference of climates, the changes of the seasons and the periods of the day, &c. This life of nature for

the main shows itself only in occasional strain or disturbance of mental tone.

In recent times a good deal has been said of the cosmical, sidereal, and telluric life of man. In such a sympathy with nature the animals essentially live: their specific characters and their particular phases of growth depend, in many cases completely, and always more or less, upon it. In the case of man these points of dependence lose importance, just in proportion to his civilisation, and the more his whole frame of soul is based upon a substructure of mental freedom. The history of the world is not bound up with revolutions in the solar system, any more than the destinies of individuals with the positions of the planets.

The difference of climate has a more solid and vigorous influence. But the response to the changes of the seasons and hours of the day is found only in faint changes of mood, which come expressly to the fore only in morbid states (including insanity) and at periods when the self-conscious life suffers depression.

In nations less intellectually emancipated, which therefore live more in harmony with nature, we find amid their superstitions and aberrations of imbecility *a few* real cases of such sympathy, and on that foundation what seems to be marvellous prophetic vision of coming conditions and of events arising therefrom. But as mental freedom gets a deeper hold, even these few and slight susceptibilities, based upon participation in the common life of nature, disappear. Animals and plants, on the contrary, remain for ever subject to such influences.

§ 393. (2) According to the concrete differences of the terrestrial globe, the general planetary life of the nature-governed mind specialises itself and breaks up into the several nature-governed minds which, on the whole, give expression to the nature of the geographical continents and constitute the diversities of *race*.

The contrast between the earth's poles, the land towards the north pole being more aggregated and preponderant over sea, whereas in the southern hemisphere it runs out in sharp points, widely distant from each other, introduces into the differences of continents a further modification which Treviranus (*Biology*, Part II) has exhibited in the case of the flora and fauna.

§ 394. This diversity descends into specialities, that may be termed *local* minds — shown in the outward modes of life and occupation, bodily structure and disposition, but still more in the inner tendency and capacity of the intellectual and moral character of the several peoples.

Back to the very beginnings of national history we see the several nations each possessing a persistent type of its own.

§ 395. (3) The soul is further de-universalised into the individualised subject. But this subjectivity is here only considered as a differentiation and singling out of the modes which nature gives; we find it as the special temperament, talent, character, physiognomy, or other disposition and idiosyncrasy, of families or single individuals.

(β) Physical Alterations.

§ 396. Taking the soul as an individual, we find its diversities, as alterations in it, the one permanent subject, and as stages in its development. As they are at once physical and mental diversities, a more concrete definition or description of them would require us to anticipate an acquaintance with the formed and matured mind.

The (1) first of these is the natural lapse of the ages in man's life. He begins with *Childhood* — mind wrapt up in itself. His next step is the fully-developed antithesis, the strain and struggle of a universality which is still subjective (as seen in ideals, fancies, hopes, ambitions) against his immediate individuality. And that individuality marks both the world

which, as it exists, fails to meet his ideal requirements, and the position of the individual himself, who is still short of independence and not fully equipped for the part he has to play (*Youth*). Thirdly, we see man in his true relation to his environment, recognising the objective necessity and reasonableness of the world as he finds it, — a world no longer incomplete, but able in the work which it collectively achieves to afford the individual a place and a security for his performance. By his share in this collective work he first is really *somebody*, gaining an effective existence and an objective value (*Manhood*). Last of all comes the finishing touch to this unity with objectivity: a unity which, while on its realist side it passes into the *inertia* of deadening habit, on its idealist side gains freedom from the limited interests and entanglements of the outward present (*Old Age*).

§ 397. (2) Next we find the individual subject to a *real* antithesis, leading it to seek and find *itself* in *another* individual. This — the *sexual relation* — on a physical basis, shows, on its one side, subjectivity remaining in an instinctive and emotional harmony of moral life and love, and not pushing these tendencies to an extreme *universal* phase, in purposes political, scientific or artistic; and on the other, shows an active half, where the individual is the vehicle of a struggle of universal and objective interests with the given conditions (both of his own existence and of that of the external world), carrying out these universal principles into a unity with the world which is his own work. The sexual tie acquires its moral and spiritual significance and function in the *family*.

§ 398. (3) When the individuality, or self-centralised being, distinguishes itself from its *mere* being, this immediate judgment is the *waking* of the soul, which confronts its self-absorbed natural life, in the first instance, as one natural quality and state confronts another state, viz. *sleep*. — The waking is not merely for the observer, or externally distinct from the sleep: it is itself the *judgment* (primary partition) of the individual soul — which is

self-existing only as it relates its self-existence to its mere existence, distinguishing itself from its still undifferentiated universality. The waking state includes generally all self-conscious and rational activity in which the mind realises its own distinct self. — Sleep is an invigoration of this activity — not as a merely negative rest from it, but as a return back from the world of specialisation, from dispersion into phases where it has grown hard and stiff, — a return into the general nature of subjectivity, which is the substance of those specialised energies and their absolute master.

The distinction between sleep and waking is one of those *posers*, as they may be called, which are often addressed to philosophy: — Napoleon, e.g., on a visit to the University of Pavia, put this question to the class of ideology. The characterisation given in the section is abstract; it primarily treats waking merely as a natural fact, containing the mental element *implicite* but not yet as invested with a special being of its own. If we are to speak more concretely of this distinction (in fundamentals it remains the same), we must take the self-existence of the individual soul in its higher aspects as the Ego of consciousness and as intelligent mind. The difficulty raised anent the distinction of the two states properly arises, only when we also take into account the dreams in sleep and describe these dreams, as well as the mental representations in the sober waking consciousness, under one and the same title of mental representations. Thus superficially classified as states of mental representation the two coincide, because we have lost sight of the difference; and in the case of any assignable distinction of waking consciousness, we can always return to the trivial remark that all this is nothing more than mental idea. But the concrete theory of the waking soul in its realised being views it as *consciousness* and *intellect*: and the world of intelligent consciousness is something quite different from a picture of mere ideas and images. The latter are in the main only externally conjoined, in an unintelligent way, by the laws of the so-

called *Association of Ideas*; though here and there of course logical principles may also be operative. But in the waking state man behaves essentially as a concrete ego, an intelligence: and because of this intelligence his sense-perception stands before him as a concrete totality of features in which each member, each point, takes up its place as at the same time determined through and with all the rest. Thus the facts embodied in his sensation are authenticated, not by his mere subjective representation and distinction of the facts as something external from the person, but by virtue of the concrete interconnexion in which each part stands with all parts of this complex. The waking state is the concrete consciousness of this mutual corroboration of each single factor of its content by all the others in the picture as perceived. The consciousness of this interdependence need not be explicit and distinct. Still this general setting to all sensations is implicitly present in the concrete feeling of self. — In order to see the difference of dreaming and waking we need only keep in view the Kantian distinction between subjectivity and objectivity of mental representation (the latter depending upon determination through categories): remembering, as already noted, that what is actually present in mind need not be therefore explicitly realised in consciousness, just as little as the exaltation of the intellectual sense to God need stand before consciousness in the shape of proofs of God's existence, although, as before explained, these proofs only serve to express the net worth and content of that feeling.

(γ) Sensibility[121].

§ 399. Sleep and waking are, primarily, it is true, not mere alterations, but *alternating* conditions (a progression *in infinitum*). This is their formal and negative relationship: but in it the *affirmative* relationship is also involved. In the self-certified existence of waking soul its mere existence is implicit as an "ideal" factor: the features which make up its sleeping nature,

where they are implicitly as in their substance, are *found* by the waking soul, in its own self, and, be it noted, for itself. The fact that these particulars, though as a mode of mind they are distinguished from the self-identity of our self-centred being, are yet simply contained in its simplicity, is what we call sensibility.

§ 400. Sensibility (feeling) is the form of the dull stirring, the inarticulate breathing, of the spirit through its unconscious and unintelligent individuality, where every definite feature is still "immediate," — neither specially developed in its content nor set in distinction as objective to subject, but treated as belonging to its most special, its natural peculiarity. The content of sensation is thus limited and transient, belonging as it does to natural, immediate being, — to what is therefore qualitative and finite.

Everything is in sensation (feeling): if you will, everything that emerges in conscious intelligence and in reason has its source and origin in sensation; for source and origin just means the first immediate manner in which a thing appears. Let it not be enough to have principles and religion only in the head: they must also be in the heart, in the feeling. What we merely have in the head is in consciousness, in a general way: the facts of it are objective — set over against consciousness, so that as it is put in me (my abstract ego) it can also be kept away and apart from me (from my concrete subjectivity). But if put in the feeling, the fact is a mode of my individuality, however crude that individuality be in such a form: it is thus treated as my *very own*. My own is something inseparate from the actual concrete self: and this immediate unity of the soul with its underlying self in all its definite content is just this inseparability; which however yet falls short of the ego of developed consciousness, and still more of the freedom of rational mind-life. It is with a quite different intensity and permanency that the will, the conscience, and the character, are our very own, than can ever be true of feeling and of the group of feelings (the heart): and this we

need no philosophy to tell us. No doubt it is correct to say that above everything the *heart* must be good. But feeling and heart is not the form by which anything is legitimated as religious, moral, true, just, &c., and an appeal to heart and feeling either means nothing or means something bad. This should hardly need enforcing. Can any experience be more trite than that feelings and hearts are also bad, evil, godless, mean, &c.? That the heart is the source only of such feelings is stated in the words: “From the heart proceed evil thoughts, murder, adultery, fornication, blasphemy, &c.” In such times when “scientific” theology and philosophy make the heart and feeling the criterion of what is good, moral, and religious, it is necessary to remind them of these trite experiences; just as it is nowadays necessary to repeat that thinking is the characteristic property by which man is distinguished from the beasts, and that he has feeling in common with them.

§ 401. What the sentient soul finds within it is, on one hand, the naturally immediate, as “ideally” in it and made its own. On the other hand and conversely, what originally belongs to the central individuality (which as further deepened and enlarged is the conscious ego and free mind) get the features of the natural corporeity, and is so felt. In this way we have two spheres of feeling. One, where what at first is a corporeal affection (e.g. of the eye or of any bodily part whatever) is made feeling (sensation) by being driven inward, memorised in the soul’s self-centred part. Another, where affections originating in the mind and belonging to it, are in order to be felt, and to be as if found, invested with corporeity. Thus the mode or affection gets a place in the subject: it is felt in the soul. The detailed specification of the former branch of sensibility is seen in the system of the senses. But the other or inwardly originated modes of feeling no less necessarily systematise themselves; and their corporisation, as put in the living and concretely developed natural being, works itself out, following the special character of the mental mode, in a special system of bodily organs.

Sensibility in general is the healthy fellowship of the individual mind in the life of its bodily part. The senses form the simple system of corporeity specified. (*a*) The "ideal" side of physical things breaks up into two — because in it, as immediate and not yet subjective ideality, distinction appears as mere variety — the senses of definite *light*, § 287 — and of *sound*, § 300. The "real" aspect similarly is with its difference double: (*b*) the senses of smell and taste, §§ 321, 322; (*c*) the sense of solid reality, of heavy matter, of heat and shape. Around the centre of the sentient individuality these specifications arrange themselves more simply than when they are developed in the natural corporeity.

The system by which the internal sensation comes to give itself specific bodily forms would deserve to be treated in detail in a peculiar science — a *psychical physiology*. Somewhat pointing to such a system is implied in the feeling of the appropriateness or inappropriateness of an immediate sensation to the persistent tone of internal sensibility (the pleasant and unpleasant): as also in the distinct parallelism which underlies the symbolical employment of sensations, e.g. of colours, tones, smells. But the most interesting side of a psychical physiology would lie in studying not the mere sympathy, but more definitely the bodily form adopted by certain mental modifications, especially the passions or emotions. We should have, e.g., to explain the line of connexion by which anger and courage are felt in the breast, the blood, the "irritable" system, just as thinking and mental occupation are felt in the head, the centre of the 'sensible' system. We should want a more satisfactory explanation than hitherto of the most familiar connexions by which tears, and voice in general, with its varieties of language, laughter, sighs, with many other specialisations lying in the line of pathognomy and physiognomy, are formed from their mental source. In physiology the viscera and the organs are treated merely as parts subservient to the animal organism; but they form at the same time a

physical system for the expression of mental states, and in this way they get quite another interpretation.

§ 402. Sensations, just because they are immediate and are found existing, are single and transient aspects of psychic life, — alterations in the substantiality of the soul, set in its self-centred life, with which that substance is one. But this self-centred being is not merely a formal factor of sensation: the soul is virtually a reflected totality of sensations — it feels *in itself* the total substantiality which it *virtually* is — it is a soul which feels.

In the usage of ordinary language, sensation and feeling are not clearly distinguished: still we do not speak of the sensation, — but of the feeling (sense) of right, of self; sentimentality (sensibility) is connected with sensation: we may therefore say sensation emphasises rather the side of passivity — the fact that we find ourselves feeling, i.e. the immediacy of mode in feeling — whereas feeling at the same time rather notes the fact that it is *we ourselves* who feel.

(b) The Feeling Soul. — (Soul as Sentiency.)[122]

§ 403. The feeling or sentient individual is the simple "ideality" or subjective side of sensation. What it has to do, therefore, is to raise its substantiality, its merely virtual filling-up, to the character of subjectivity, to take possession of it, to realise its mastery over its own. As sentient, the soul is no longer a mere natural, but an inward, individuality: the individuality which in the merely substantial totality was only formal to it has to be liberated and made independent.

Nowhere so much as in the case of the soul (and still more of the mind) if we are to understand it, must that feature of "ideality" be kept in view, which represents it as the *negation* of the real, but a negation, where the real is put past, virtually retained, although it does not *exist*. The feature is one with which we are familiar in regard to our mental ideas or to memory.

Every individual is an infinite treasury of sensations, ideas, acquired lore, thoughts, &c.; and yet the ego is one and uncompounded, a deep featureless characterless mine, in which all this is stored up, without existing. It is only when *I* call to mind *an* idea, that I bring it out of that interior to existence before consciousness. Sometimes, in sickness, ideas and information, supposed to have been forgotten years ago, because for so long they had not been brought into consciousness, once more come to light. They were not in our possession, nor by such reproduction as occurs in sickness do they for the future come into our possession; and yet they were in us and continue to be in us still. Thus a person can never know how much of things he once learned he really has in him, should he have once forgotten them: they belong not to his actuality or subjectivity as such, but only to his implicit self. And under all the superstructure of specialised and instrumental consciousness that may subsequently be added to it, the individuality always remains this single-souled inner life. At the present stage this singleness is, primarily, to be defined as one of feeling — as embracing the corporeal in itself: thus denying the view that this body is something material, with parts outside parts and outside the soul. Just as the number and variety of mental representations is no argument for an extended and real multeity in the ego; so the "real" outness of parts in the body has no truth for the sentient soul. As sentient, the soul is characterised as immediate, and so as natural and corporeal: but the outness of parts and sensible multiplicity of this corporeal counts for the soul (as it counts for the intelligible unity) not as anything real, and therefore not as a barrier: the soul is this intelligible unity *in existence*, — the existent speculative principle. Thus in the body it is one simple, omnipresent unity. As to the representative faculty the body is but *one* representation, and the infinite variety of its material structure and organisation is reduced to the *simplicity* of one definite conception: so in the sentient soul, the corporeity, and all

that outness of parts to parts which belongs to it, is reduced to *ideality* (the *truth* of the natural multiplicity). The soul is virtually the totality of nature: as an individual soul it is a monad: it is itself the explicitly put totality of its particular world, — that world being included in it and filling it up; and to that world it stands but as to itself.

§ 404. As *individual*, the soul is exclusive and always exclusive: any difference there is, it brings within itself. What is differentiated from it is as yet no external object (as in consciousness), but only the aspects of its own sentient totality, &c. In this partition (judgment) of itself it is always subject: its object is its substance, which is at the same time its predicate. This *substance* is still the content of its natural life, but turned into the content of the individual sensation-laden soul; yet as the soul is in that content still particular, the content is its particular world, so far as that is, in an implicit mode, included in the ideality of the subject.

By itself, this stage of mind is the stage of its darkness: its features are not developed to conscious and intelligent content: so far it is formal and only formal. It acquires a peculiar interest in cases where it is as a *form* and appears as a special *state* of mind (§ 350), to which the soul, which has already advanced to consciousness and intelligence, may again sink down. But when a truer phase of mind thus exists in a more subordinate and abstract one, it implies a want of adaptation, which is *disease*. In the present stage we must treat, first, of the abstract psychical modifications by themselves, secondly, as morbid states of mind: the latter being only explicable by means of the former.

(α) The Feeling Soul in its Immediacy.

§ 405. (αα) Though the sensitive individuality is undoubtedly a monadic individual, it is because immediate, not yet as *its self* not a true subject reflected into itself, and is therefore passive. Hence the individuality of its

true self is a different subject from it — a subject which may even exist as another individual. By the self-hood of the latter it — a substance, which is only a non-independent predicate — is then set in vibration and controlled without the least resistance on its part. This other subject by which it is so controlled may be called its *genius*.

In the ordinary course of nature this is the condition of the child in its mother's womb: — a condition neither merely bodily nor merely mental, but psychical — a correlation of soul to soul. Here are two individuals, yet in undivided psychic unity: the one as yet no *self*, as yet nothing impenetrable, incapable of resistance: the other is its actuating subject, the *single* self of the two. The mother is the *genius* of the child; for by genius we commonly mean the total mental self-hood, as it has existence of its own, and constitutes the subjective substantiality of some one else who is only externally treated as an individual and has only a nominal independence. The underlying essence of the genius is the sum total of existence, of life, and of character, not as a mere possibility, or capacity, or virtuality, but as efficiency and realised activity, as concrete subjectivity.

If we look only to the spatial and material aspects of the child's existence as an embryo in its special integuments, and as connected with the mother by means of umbilical cord, placenta, &c., all that is presented to the senses and reflection are certain anatomical and physiological facts — externalities and instrumentalities in the sensible and material which are insignificant as regards the main point, the psychical relationship. What ought to be noted as regards this psychical tie are not merely the striking effects communicated to and stamped upon the child by violent emotions, injuries, &c. of the mother, but the whole psychical *judgment* (partition) of the underlying nature, by which the female (like the monocotyledons among vegetables) can suffer disruption in twain, so that the child has not merely got *communicated* to it, but has originally received morbid dispositions as

well as other pre-dispositions of shape, temper, character, talent, idiosyncrasies, &c.

Sporadic examples and traces of this *magic* tie appear elsewhere in the range of self-possessed conscious life, say between friends, especially female friends with delicate nerves (a tie which may go so far as to show “magnetic” phenomena), between husband and wife and between members of the same family.

The total sensitivity has its self here in a separate subjectivity, which, in the case cited of this sentient life in the ordinary course of nature, is visibly present as another and a different individual. But this sensitive totality is meant to elevate its self-hood out of itself to subjectivity in one and the same individual: which is then its indwelling consciousness, self-possessed, intelligent, and reasonable. For such a consciousness the merely sentient life serves as an underlying and only implicitly existent material; and the self-possessed subjectivity is the rational, self-conscious, controlling genius thereof. But this sensitive nucleus includes not merely the purely unconscious, congenital disposition and temperament, but within its enveloping simplicity it acquires and retains also (in habit, as to which see later) all further ties and essential relationships, fortunes, principles — everything in short belonging to the character, and in whose elaboration self-conscious activity has most effectively participated. The sensitivity is thus a soul in which the whole mental life is condensed. The total individual under this concentrated aspect is distinct from the existing and actual play of his consciousness, his secular ideas, developed interests, inclinations, &c. As contrasted with this looser aggregate of means and methods the more intensive form of individuality is termed the genius, whose decision is ultimate whatever may be the show of reasons, intentions, means, of which the more public consciousness is so liberal. This concentrated individuality also reveals itself under the aspect of what is called the heart and soul of

feeling. A man is said to be heartless and unfeeling when he looks at things with self-possession and acts according to his permanent purposes, be they great substantial aims or petty and unjust interests: a good-hearted man, on the other hand, means rather one who is at the mercy of his individual sentiment, even when it is of narrow range and is wholly made up of particularities. Of such good nature or goodness of heart it may be said that it is less the genius itself than the *indulgere genio*.

§ 406. (ββ) The sensitive life, when it becomes a *form* or *state* of the self-conscious, educated, self-possessed human being is a disease. The individual in such a morbid state stands in direct contact with the concrete contents of his own self, whilst he keeps his self-possessed consciousness of self and of the causal order of things apart as a distinct state of mind. This morbid condition is seen in *magnetic somnambulism* and cognate states.

In this summary encyclopaedic account it is impossible to supply a demonstration of what the paragraph states as the nature of the remarkable condition produced chiefly by animal magnetism — to show, in other words, that it is in harmony with the facts. To that end the phenomena, so complex in their nature and so very different one from another, would have first of all to be brought under their general points of view. The facts, it might seem, first of all call for verification. But such a verification would, it must be added, be superfluous for those on whose account it was called for: for they facilitate the inquiry for themselves by declaring the narratives — infinitely numerous though they be and accredited by the education and character of the witnesses — to be mere deception and imposture. The *a priori* conceptions of these inquirers are so rooted that no testimony can avail against them, and they have even denied what they had seen with their own eyes. In order to believe in this department even what one sees with these eyes, and still more to understand it, the first requisite is not to be in

bondage to the hard and fast categories of the practical intellect. The chief points on which the discussion turns may here be given:

(α) To the *concrete* existence of the individual belongs the aggregate of his fundamental *interests*, both the essential and the particular empirical ties which connect him with other men and the world at large. This totality forms *his* actuality, in the sense that it lies in fact immanent in him; it has already been called his *genius*. This genius is not the free mind which wills and thinks: the form of sensitivity, in which the individual here appears immersed, is, on the contrary, a surrender of his self-possessed intelligent existence. The first conclusion to which these considerations lead, with reference to the contents of consciousness in the somnambulist stage, is that it is only the range of his individually moulded world (of his private interests and narrow relationships) which appear there. Scientific theories and philosophic conceptions or general truths require a different soil, — require an intelligence which has risen out of the inarticulate mass of mere sensitivity to free consciousness. It is foolish therefore to expect revelations about the higher ideas from the somnambulist state.

(β) Where a human being's senses and intellect are sound, he is fully and intelligently alive to that reality of his which gives concrete filling to his individuality: but he is awake to it in the form of interconnexion between himself and the features of that reality conceived as an external and a separate world, and he is aware that this world is in itself also a complex of interconnexions of a practically intelligible kind. In his subjective ideas and plans he has also before him this causally connected scheme of things he calls his world and the series of means which bring his ideas and his purposes into adjustment with the objective existences, which are also means and ends to each other. At the same time, this world which is outside him has its threads in him to such a degree that it is these threads which make him what he really is: he too would become extinct if these

externalities were to disappear, unless by the aid of religion, subjective reason, and character, he is in a remarkable degree self-supporting and independent of them. But, then, in the latter case he is less susceptible of the psychical state here spoken of. — As an illustration of that identity with the surroundings may be noted the effect produced by the death of beloved relatives, friends, &c. on those left behind, so that the one dies or pines away with the loss of the other. (Thus Cato, after the downfall of the Roman republic, could live no longer: his inner reality was neither wider than higher than it.) Compare home-sickness, and the like.

(γ) But when all that occupies the waking consciousness, the world outside it and its relationship to that world is under a veil, and the soul is thus sunk in sleep (in magnetic sleep, in catalepsy, and other diseases, e.g. those connected with female development, or at the approach of death, &c.), then that *immanent actuality* of the individual remains the same substantial total as before, but now as a purely sensitive life with an inward vision and an inward consciousness. And because it is the adult, formed, and developed consciousness which is degraded into this state of sensitivity, it retains along with its content a certain nominal self-hood, a formal vision and awareness, which however does not go so far as the conscious judgment or discernment by which its contents, when it is healthy and awake, exist for it as an outward objectivity. The individual is thus a monad which is inwardly aware of its actuality — a genius which beholds itself. The characteristic point in such knowledge is that the very same facts (which for the healthy consciousness are an objective practical reality, and to know which, in its sober moods, it needs the intelligent chain of means and conditions in all their real expansion) are now immediately known and perceived in this immanence. This perception is a sort of *clairvoyance*; for it is a consciousness living in the undivided substantiality of the genius, and finding itself in the very heart of the interconnexion, and so can dispense

with the series of conditions, external one to another, which lead up to the result, — conditions which cool reflection has in succession to traverse and in so doing feels the limits of its own individual externality. But such clairvoyance — just because its dim and turbid vision does not present the facts in a rational interconnexion — is for that very reason at the mercy of every private contingency of feeling and fancy, &c. — not to mention that foreign *suggestions* (see later) intrude into its vision. It is thus impossible to make out whether what the clairvoyants really see preponderates over what they deceive themselves in. — But it is absurd to treat this visionary state as a sublime mental phase and as a truer state, capable of conveying general truths[123].

(δ) An essential feature of this sensitivity, with its absence of intelligent and volitional personality, is this, that it is a state of passivity, like that of the child in the womb. The patient in this condition is accordingly made, and continues to be, subject to the power of another person, the magnetiser; so that when the two are thus in psychical *rapport*, the selfless individual, not really a "person," has for his subjective consciousness the consciousness of the other. This latter self-possessed individual is thus the effective subjective soul of the former, and the genius which may even supply him with a train of ideas. That the somnambulist perceives in himself tastes and smells which are present in the person with whom he stands *en rapport*, and that he is aware of the other inner ideas and present perceptions of the latter as if they were his own, shows the substantial identity which the soul (which even in its concreteness is also truly immaterial) is capable of holding with another. When the substance of both is thus made one, there is only one subjectivity of consciousness: the patient has a sort of individuality, but it is empty, not on the spot, not actual: and this nominal self accordingly derives its whole stock of ideas from the

sensations and ideas of the other, in whom it sees, smells, tastes, reads, and hears. It is further to be noted on this point that the somnambulist is thus brought into *rapport* with two genii and a twofold set of ideas, his own and that of the magnetiser. But it is impossible to say precisely which sensations and which visions he, in this nominal perception, receives, beholds and brings to knowledge from his own inward self, and which from the suggestions of the person with whom he stands in relation. This uncertainty may be the source of many deceptions, and accounts among other things for the diversity that inevitably shows itself among somnambulists from different countries and under *rapport* with persons of different education, as regards their views on morbid states and the methods of cure, or medicines for them, as well as on scientific and intellectual topics.

(ε) As in this sensitive substantiality there is no contrast to external objectivity, so within itself the subject is so entirely one that all varieties of sensation have disappeared, and hence, when the activity of the sense-organs is asleep, the "common sense," or "general feeling" specifies itself to several functions; one sees and hears with the fingers, and especially with the pit of the stomach, &c.

To comprehend a thing means in the language of practical intelligence to be able to trace the series of means intervening between a phenomenon and some other existence on which it depends, — to discover what is called the ordinary course of nature, in compliance with the laws and relations of the intellect, e.g. causality, reasons, &c. The purely sensitive life, on the contrary, even when it retains that mere nominal consciousness, as in the morbid state alluded to, is just this form of immediacy, without any distinctions between subjective and objective, between intelligent personality and objective world, and without the aforementioned finite ties between them. Hence to understand this intimate conjunction, which, though all-embracing, is without any definite points of attachment, is

impossible, so long as we assume independent personalities, independent one of another and of the objective world which is their content — so long as we assume the absolute spatial and material externality of one part of being to another.

(β) Self-feeling (Sense of Self)[124].

§ 407. (αα) The sensitive totality is, in its capacity of individual, essentially the tendency to distinguish itself in itself, and to wake up to the *judgment in itself*, in virtue of which it has *particular* feelings and stands as a *subject* in respect of these aspects of itself. The subject as such gives these feelings a place as *its own* in itself. In these private and personal sensations it is immersed, and at the same time, because of the "ideality" of the particulars, it combines itself in them with itself as a subjective unit. In this way it is *self-feeling*, and is so at the same time only in the *particular feeling*.

§ 408. (ββ) In consequence of the immediacy, which still marks the self-feeling, i.e. in consequence of the element of corporeality which is still undetached from the mental life, and as the feeling too is itself particular and bound up with a special corporeal form, it follows that although the subject has been brought to acquire intelligent consciousness, it is still susceptible of disease, so far as to remain fast in a *special* phase of its self-feeling, unable to refine it to "ideality" and get the better of it. The fully-furnished self of intelligent consciousness is a conscious subject, which is consistent in itself according to an order and behaviour which follows from its individual position and its connexion with the external world, which is no less a world of law. But when it is engrossed with a single phase of feeling, it fails to assign that phase its proper place and due subordination in the individual system of the world which a conscious subject is. In this way the subject finds itself in contradiction between the totality systematised in

its consciousness, and the single phase or fixed idea which is not reduced to its proper place and rank. This is Insanity or mental Derangement.

In considering insanity we must, as in other cases, anticipate the full-grown and intelligent conscious subject, which is at the same time the *natural* self of *self-feeling*. In such a phase the self can be liable to the contradiction between its own free subjectivity and a particularity which, instead of being "idealised" in the former, remains as a fixed element in self-feeling. Mind as such is free, and therefore not susceptible of this malady. But in older metaphysics mind was treated as a soul, as a thing; and it is only as a thing, i.e. as something natural and existent, that it is liable to insanity — the settled fixture of some finite element in it. Insanity is therefore a psychical disease, i.e. a disease of body and mind alike: the commencement may appear to start from one more than other, and so also may the cure.

The self-possessed and healthy subject has an active and present consciousness of the ordered whole of his individual world, into the system of which he subsumes each special content of sensation, idea, desire, inclination, &c., as it arises, so as to insert them in their proper place. He is the *dominant genius* over these particularities. Between this and insanity the difference is like that between waking and dreaming: only that in insanity the dream falls within the waking limits, and so makes part of the actual self-feeling. Error and that sort of thing is a proposition consistently admitted to a place in the objective interconnexion of things. In the concrete, however, it is often difficult to say where it begins to become derangement. A violent, but groundless and senseless outburst of hatred, &c., may, in contrast to a presupposed higher self-possession and stability of character, make its victim seem to be beside himself with frenzy. But the main point in derangement is the contradiction which a feeling with a fixed corporeal embodiment sets up against the whole mass of adjustments

forming the concrete consciousness. The mind which is in a condition of mere *being*, and where such being is not rendered fluid in its consciousness, is diseased. The contents which are set free in this reversion to mere nature are the self-seeking affections of the heart, such as vanity, pride, and the rest of the passions — fancies and hopes — merely personal love and hatred. When the influence of self-possession and of general principles, moral and theoretical, is relaxed, and ceases to keep the natural temper under lock and key, the earthly elements are set free — that evil which is always latent in the heart, because the heart as immediate is natural and selfish. It is the evil genius of man which gains the upper hand in insanity, but in distinction from and contrast to the better and more intelligent part, which is there also. Hence this state is mental derangement and distress. The right psychical treatment therefore keeps in view the truth that insanity is not an abstract *loss* of reason (neither in the point of intelligence nor of will and its responsibility), but only derangement, only a contradiction in a still subsisting reason; — just as physical disease is not an abstract, i.e. mere and total, loss of health (if it were that, it would be death), but a contradiction in it. This humane treatment, no less benevolent than reasonable (the services of Pinel towards which deserve the highest acknowledgment), presupposes the patient's rationality, and in that assumption has the sound basis for dealing with him on this side — just as in the case of bodily disease the physician bases his treatment on the vitality which as such still contains health.

(γ) Habit[125].

§ 409. Self-feeling, immersed in the detail of the feelings (in simple sensations, and also desires, instincts, passions, and their gratification), is undistinguished from them. But in the self there is latent a simple self-relation of ideality, a nominal universality (which is the truth of these

details): and as so universal, the self is to be stamped upon, and made appear in, this life of feeling, yet so as to distinguish itself from the particular details, and be a realised universality. But this universality is not the full and sterling truth of the specific feelings and desires; what they specifically contain is as yet left out of account. And so too the particularity is, as now regarded, equally formal; it counts only as the *particular being* or immediacy of the soul in opposition to its equally formal and abstract realisation. This particular being of the soul is the factor of its corporeity; here we have it breaking with this corporeity, distinguishing it from itself, — itself a *simple* being, — and becoming the "ideal," subjective substantiality of it, — just as in its latent notion (§ 359) it was the substance, and the mere substance, of it.

But this abstract realisation of the soul in its corporeal vehicle is not yet the self — not the existence of the universal which is for the universal. It is the corporeity reduced to its mere *ideality*; and so far only does corporeity belong to the soul as such. That is to say, as space and time — the abstract one-outside-another, as, in short, empty space and empty time — are only subjective form — pure act of intuition; so that pure being (which through the supersession in it of the particularity of the corporeity, or of the immediate corporeity as such has realised itself) is mere intuition and no more, lacking consciousness, but the basis of consciousness. And consciousness it becomes, when the corporeity, of which it is the subjective substance, and which still continues to exist, and that as a barrier for it, has been absorbed by it, and it has been invested with the character of self-centred subject.

§ 410. The soul's making itself an abstract universal being, and reducing the particulars of feelings (and of consciousness) to a mere feature of its being is Habit. In this manner the soul has the contents in possession, and contains them in such manner that in these features it is not as sentient, nor

does it stand in relationship with them as distinguishing itself from them, nor is absorbed in them, but has them and moves in them, without feeling or consciousness of the fact. The soul is freed from them, so far as it is not interested in or occupied with them: and whilst existing in these forms as its possession, it is at the same time open to be otherwise occupied and engaged — say with feeling and with mental consciousness in general.

This process of building up the particular and corporeal expressions of feeling into the being of the soul appears as a *repetition* of them, and the generation of habit as *practice*. For, this being of the soul, if in respect of the natural particular phase it be called an abstract universality to which the former is transmuted, is a reflexive universality (§ 175); i.e. the one and the same, that recurs in a series of units of sensation, is reduced to unity, and this abstract unity expressly stated.

Habit, like memory, is a difficult point in mental organisation: habit is the mechanism of self-feeling, as memory is the mechanism of intelligence. The natural qualities and alterations of age, sleep and waking, are "immediately" natural: habit, on the contrary, is the mode of feeling (as well as intelligence, will, &c., so far as they belong to self-feeling) made into a natural and mechanical existence. Habit is rightly called a second nature; nature, because it is an immediate being of the soul; a second nature, because it is an immediacy created by the soul, impressing and moulding the corporeality which enters into the modes of feeling as such and into the representations and volitions so far as they have taken corporeal form (§ 401).

In habit the human being's mode of existence is "natural," and for that reason not free; but still free, so far as the merely natural phase of feeling is by habit reduced to a mere being of *his*, and he is no longer involuntarily attracted or repelled by it, and so no longer interested, occupied, or dependent in regard to it. The want of freedom in habit is partly merely

formal, as habit merely attaches to the being of the soul; partly only relative, so far as it strictly speaking arises only in the case of bad habits, or so far as a habit is opposed by another purpose: whereas the habit of right and goodness is an embodiment of liberty. The main point about Habit is that by its means man gets emancipated from the feelings, even in being affected by them. The different forms of this may be described as follows: (α) The *immediate* feeling is negated and treated as indifferent. One who gets inured against external sensations (frost, heat, weariness of the limbs, &c., sweet tastes, &c.), and who hardens the heart against misfortune, acquires a strength which consists in this, that although the frost, &c. — or the misfortune — is felt, the affection is deposed to a mere externality and immediacy; the universal psychical life keeps its own abstract independence in it, and the self-feeling as such, consciousness, reflection, and any other purposes and activity, are no longer bothered with it. (β) There is indifference towards the satisfaction: the desires and impulses are by the *habit* of their satisfaction deadened. This is the rational liberation from them; whereas monastic renunciation and forcible interference do not free from them, nor are they in conception rational. Of course in all this it is assumed that the impulses are kept as the finite modes they naturally are, and that they, like their satisfaction, are subordinated as partial factors to the reasonable will. (γ) In habit regarded as *aptitude*, or skill, not merely has the abstract psychical life to be kept intact *per se*, but it has to be imposed as a subjective aim, to be made a power in the bodily part, which is rendered subject and thoroughly pervious to it. Conceived as having the inward purpose of the subjective soul thus imposed upon it, the body is treated as an immediate externality and a barrier. Thus comes out the more decided rupture between the soul as simple self-concentration, and its earlier naturalness and immediacy; it has lost its original and immediate identity with the bodily nature, and as external has first to be reduced to that

position. Specific feelings can only get bodily shape in a perfectly specific way (§ 401); and the immediate portion of body is a particular possibility for a specific aim (a particular aspect of its differentiated structure, a particular organ of its organic system). To mould such an aim in the organic body is to bring out and express the "ideality" which is implicit in matter always, and especially so in the specific bodily part, and thus to enable the soul, under its volitional and conceptual characters, to exist as substance in its corporeity. In this way an aptitude shows the corporeity rendered completely pervious, made into an instrument, so that when the conception (e.g. a series of musical notes) is in me, then without resistance and with ease the body gives them correct utterance.

The form of habit applies to all kinds and grades of mental action. The most external of them, i.e. the spatial direction of an individual, viz. his upright posture, has been by will made a habit — a position taken without adjustment and without consciousness — which continues to be an affair of his persistent will; for the man stands only because and in so far as he wills to stand, and only so long as he wills it without consciousness. Similarly our eyesight is the concrete habit which, without an express adjustment, combines in a single act the several modifications of sensation, consciousness, intuition, intelligence, &c., which make it up. Thinking, too, however free and active in its own pure element it becomes, no less requires habit and familiarity (this impromptuity or form of immediacy), by which it is the property of my single self where I can freely and in all directions range. It is through this habit that I come to realise my *existence* as a thinking being. Even here, in this spontaneity of self-centred thought, there is a partnership of soul and body (hence, want of habit and too-long-continued thinking cause headache); habit diminishes this feeling, by making the natural function an immediacy of the soul. Habit on an ampler

scale, and carried out in the strictly intellectual range, is recollection and memory, whereof we shall speak later.

Habit is often spoken of disparagingly and called lifeless, casual and particular. And it is true that the form of habit, like any other, is open to anything we chance to put into it; and it is habit of living which brings on death, or, if quite abstract, is death itself: and yet habit is indispensable for the *existence* of all intellectual life in the individual, enabling the subject to be a concrete immediacy, an "ideality" of soul — enabling the matter of consciousness, religious, moral, &c., to be his as *this* self, *this* soul, and no other, and be neither a mere latent possibility, nor a transient emotion or idea, nor an abstract inwardness, cut off from action and reality, but part and parcel of his being. In scientific studies of the soul and the mind, habit is usually passed over — either as something contemptible — or rather for the further reason that it is one of the most difficult questions of psychology.

(c) The Actual Soul.[126]

§ 411. The Soul, when its corporeity has been moulded and made thoroughly its own, finds itself there a *single* subject; and the corporeity is an externality which stands as a predicate, in being related to which, it is related to itself. This externality, in other words, represents not itself, but the soul, of which it is the *sign*. In this identity of interior and exterior, the latter subject to the former, the soul is *actual*: in its corporeity it has its free shape, in which it *feels itself* and makes *itself felt*, and which as the Soul's work of art has *human* pathognomic and physiognomic expression.

Under the head of human expression are included, e.g., the upright figure in general, and the formation of the limbs, especially the hand, as the absolute instrument, of the mouth — laughter, weeping, &c., and the note of mentality diffused over the whole, which at once announces the body at

the externality of a higher nature. This note is so slight, indefinite, and inexpressible a modification, because the figure in its externality is something immediate and natural, and can therefore only be an indefinite and quite imperfect sign for the mind, unable to represent it in its actual universality. Seen from the animal world, the human figure is the supreme phase in which mind makes an appearance. But for the mind it is only its first appearance, while language is its perfect expression. And the human figure, though its proximate phase of existence, is at the same time in its physiognomic and pathognomic quality something contingent to it. To try to raise physiognomy and above all cranioscopy (phrenology) to the rank of sciences, was therefore one of the vainest fancies, still vainer than a *signatura rerum*, which supposed the shape of a plant to afford indication of its medicinal virtue.

§ 412. Implicitly the soul shows the untruth and unreality of matter; for the soul, in its concentrated self, cuts itself off from its immediate being, placing the latter over against it as a corporeity incapable of offering resistance to its moulding influence. The soul, thus setting in opposition its being to its (conscious) self, absorbing it, and making it its own, has lost the meaning of mere soul, or the “immediacy” of mind. The actual soul with its sensation and its concrete self-feeling turned into habit, has implicitly realised the ‘ideality’ of its qualities; in this externality it has recollected and inwardised itself, and is infinite self-relation. This free universality thus made explicit shows the soul awaking to the higher stage of the ego, or abstract universality in so far as it is *for* the abstract universality. In this way it gains the position of thinker and subject — specially a subject of the judgment in which the ego excludes from itself the sum total of its merely natural features as an object, a world external to it, — but with such respect to that object that in it it is immediately reflected into itself. Thus soul rises to become *Consciousness*.

Sub-Section B. Phenomenology Of Mind. Consciousness.

§ 413. CONSCIOUSNESS constitutes the reflected or correlational grade of mind: the grade of mind as *appearance*. *Ego* is infinite self-relation of mind, but as subjective or as self-certainty. The immediate identity of the natural soul has been raised to this pure "ideal" self-identity; and what the former *contained* is for this self-subsistent reflection set forth as an *object*. The pure abstract freedom of mind lets go from it its specific qualities, — the soul's natural life — to an equal freedom as an independent *object*. It is of this latter, as external to it, that the *ego* is in the first instance aware (conscious), and as such it is Consciousness. Ego, as this absolute negativity, is implicitly the identity in the otherness: the *ego* is itself that other and stretches over the object (as if that object were implicitly cancelled) — it is one side of the relationship and the whole relationship — the light, which manifests itself and something else too.

§ 414. The self-identity of the mind, thus first made explicit as the Ego, is only its abstract formal identity. As *soul* it was under the phase of *substantial* universality; now, as subjective reflection in itself, it is referred to this substantiality as to its negative, something dark and beyond it. Hence consciousness, like reciprocal dependence in general, is the contradiction between the independence of the two sides and their identity in which they are merged into one. The mind as ego is *essence*; but since reality, in the sphere of essence, is represented as in immediate being and at the same time as "ideal," it is as consciousness only the *appearance* (phenomenon) of mind.

§ 415. As the ego is by itself only a formal identity, the dialectical movement of its intelligible unity, i.e. the successive steps in further specification of consciousness, does not to it seem to be its own activity, but is implicit, and to the ego it seems an alteration of the object. Consciousness consequently appears differently modified according to the difference of the given object; and the gradual specification of consciousness appears as a variation in the characteristics of its objects. Ego, the subject of consciousness, is thinking: the logical process of modifying the object is what is identical in subject and object, their absolute interdependence, what makes the object the subject's own.

The Kantian philosophy may be most accurately described as having viewed the mind as consciousness, and as containing the propositions only of a *phenomenology* (not of a *philosophy*) of mind. The Ego Kant regards as reference to something away and beyond (which in its abstract description is termed the thing-at-itself); and it is only from this finite point of view that he treats both intellect and will. Though in the notion of a power of *reflective* judgment he touches upon the *Idea* of mind — a subject-objectivity, an *intuitive intellect*, &c., and even the Idea of Nature, still this Idea is again deposed to an appearance, i.e. to a subjective maxim (§ 58). Reinhold may therefore be said to have correctly appreciated Kantism when he treated it as a theory of consciousness (under the name of "faculty of ideation"). Fichte kept to the same point of view: his non-ego is only something set over against the ego, only defined as in *consciousness*: it is made no more than an infinite "shock," i.e. a thing-in-itself. Both systems therefore have clearly not reached the intelligible unity or the mind as it actually and essentially is, but only as it is in reference to something else.

As against Spinozism, again, it is to be noted that the mind in the judgment by which it "constitutes" itself an ego (a free subject contrasted with its qualitative affection) has emerged from substance, and that the

philosophy, which gives this judgment as the absolute characteristic of mind, has emerged from Spinozism.

§ 416. The aim of conscious mind is to make its appearance identical with its essence, to raise its *self-certainty to truth*. The *existence* of mind in the stage of consciousness is finite, because it is merely a nominal self-relation, or mere certainty. The object is only abstractly characterised as *its*; in other words, in the object it is only as an abstract ego that the mind is reflected into itself: hence its existence there has still a content, which is not as its own.

§ 417. The grades of this elevation of certainty to truth are three in number: first (*a*) consciousness in general, with an object set against it; (*b*) self-consciousness, for which *ego* is the object; (*c*) unity of consciousness and self-consciousness, where the mind sees itself embodied in the object and sees itself as implicitly and explicitly determinate, as Reason, the *notion* of mind.

(a) Consciousness Proper[127].

(α) Sensuous consciousness.

§ 418. Consciousness is, first, *immediate* consciousness, and its reference to the object accordingly the simple and underived certainty of it. The object similarly, being immediate, an existent, reflected in itself, is further characterised as immediately singular. This is sense-consciousness.

Consciousness — as a case of correlation — comprises only the categories belonging to the abstract ego or formal thinking; and these it treats as features of the object (§ 415). Sense-consciousness therefore is aware of the object as an existent, a something, an existing thing, a singular, and so on. It appears as wealthiest in matter, but as poorest in thought. That

wealth of matter is made out of sensations: they are the *material* of consciousness (§ 414), the substantial and qualitative, what the soul in its anthropological sphere is and finds *in itself*. This material the ego (the reflection of the soul in itself) separates from itself, and puts it first under the category of being. Spatial and temporal Singularness, *here* and *now* (the terms by which in the Phenomenology of the Mind (W. II. p. 73), I described the object of sense-consciousness) strictly belongs to *intuition*. At present the object is at first to be viewed only in its correlation to *consciousness*, i.e. a something *external* to it, and not yet as external on its own part, or as being beside and out of itself.

§ 419. The *sensible* as somewhat becomes an *other*: the reflection in itself of this *somewhat*, the *thing*, has *many* properties; and as a single (thing) in its immediacy has several *predicates*. The muchness of the sense-singular thus becomes a breadth — a variety of relations, reflectional attributes, and universalities. These are logical terms introduced by the thinking principle, i.e. in this case by the Ego, to describe the sensible. But the Ego as itself apparent sees in all this characterisation a change in the object; and self-consciousness, so construing the object, is sense-perception.

(β) Sense-perception[128].

§ 420. Consciousness, having passed beyond the sensibility, wants to take the object in its truth, not as merely immediate, but as mediated, reflected in itself, and universal. Such an object is a combination of sense qualities with attributes of wider range by which thought defines concrete relations and connexions. Hence the identity of consciousness with the object passes from the abstract identity of "I am sure" to the definite identity of "I know, and am aware."

The particular grade of consciousness on which Kantism conceives the mind is perception: which is also the general point of view taken by

ordinary consciousness, and more or less by the sciences. The sensuous certitudes of single apperceptions or observations form the starting-point: these are supposed to be elevated to truth, by being regarded in their bearings, reflected upon, and on the lines of definite categories turned at the same time into something necessary and universal, viz. *experiences*.

§ 421. This conjunction of individual and universal is admixture — the individual remains at the bottom hard and unaffected by the universal, to which however it is related. It is therefore a tissue of contradictions — between the single things of sense apperception, which form the alleged ground of general experience, and the universality which has a higher claim to be the essence and ground — between the individuality of a thing which, taken in its concrete content, constitutes its independence and the various properties which, free from this negative link and from one another, are independent universal *matters* (§ 123). This contradiction of the finite which runs through all forms of the logical spheres turns out most concrete, when the somewhat is defined as *object* (§ 194 seqq.).

(γ) The Intellect[129].

§ 422. The proximate *truth* of perception is that it is the object which is an *appearance*, and that the object's reflection in self is on the contrary a self-subsistent inward and universal. The consciousness of such an object is *intellect*. This inward, as we called it, of the thing is on one hand the suppression of the multiplicity of the sensible, and, in that manner, an abstract identity: on the other hand, however, it also for that reason contains the multiplicity, but as an interior "simple" difference, which remains self-identical in the vicissitudes of appearance. This simple difference is the realm of *the laws* of the phenomena — a copy of the phenomenon, but brought to rest and universality.

§ 423. The law, at first stating the mutual dependence of universal, permanent terms, has, in so far as its distinction is the inward one, its necessity on its own part; the one of the terms, as not externally different from the other, lies immediately in the other. But in this manner the interior distinction is, what it is in truth, the distinction on its own part, or the distinction which is none. With this new form-characteristic, on the whole, consciousness *implicitly* vanishes: for consciousness as such implies the reciprocal independence of subject and object. The ego in its judgment has an object which is not distinct from it, — it has itself. Consciousness has passed into self-consciousness.

(b) Self-consciousness[130].

§ 424. *Self-consciousness* is the truth of consciousness: the latter is a consequence of the former, all consciousness of an other object being as a matter of fact also self-consciousness. The object is my idea: I am aware of the object as mine; and thus in it I am aware of me. The formula of self-consciousness is I = I: — abstract freedom, pure "ideality." In so far it lacks "reality": for as it is its own object, there is strictly speaking no object, because there is no distinction between it and the object.

§ 425. Abstract self-consciousness is the first negation of consciousness, and for that reason it is burdened with an external object, or, nominally, with the negation of it. Thus it is at the same time the antecedent stage, consciousness: it is the contradiction of itself as self-consciousness and as consciousness. But the latter aspect and the negation in general is in I = I potentially suppressed; and hence as this certitude of self against the object it is the *impulse* to realise its implicit nature, by giving its abstract self-awareness content and objectivity, and in the other direction to free itself from its sensuousness, to set aside the given objectivity and identify it with

itself. The two processes are one and the same, the identification of its consciousness and self-consciousness.

(α) Appetite or Instinctive Desire[131].

§ 426. Self-consciousness, in its immediacy, is a singular, and a desire (appetite), — the contradiction implied in its abstraction which should yet be objective, — or in its immediacy which has the shape of an external object and should be subjective. The certitude of one's self, which issues from the suppression of mere consciousness, pronounces the *object* null: and the outlook of self-consciousness towards the object equally qualifies the abstract ideality of such self-consciousness as null.

§ 427. Self-consciousness, therefore, knows itself implicit in the object, which in this outlook is conformable to the appetite. In the negation of the two one-sided moments by the ego's own activity, this identity comes to be *for* the ego. To this activity the object, which implicitly and for self-consciousness is self-less, can make no resistance: the dialectic, implicit in it, towards self-suppression exists in this case as that activity of the ego. Thus while the given object is rendered subjective, the subjectivity divests itself of its one-sidedness and becomes objective to itself.

§ 428. The product of this process is the fast conjunction of the ego with itself, its satisfaction realised, and itself made actual. On the external side it continues, in this return upon itself, primarily describable as an individual, and maintains itself as such; because its bearing upon the self-less object is purely negative, the latter, therefore, being merely consumed. Thus appetite in its satisfaction is always destructive, and in its content selfish: and as the satisfaction has only happened in the individual (and that is transient) the appetite is again generated in the very act of satisfaction.

§ 429. But on the inner side, or implicitly, the sense of self which the ego gets in the satisfaction does not remain in abstract self-concentration or in

mere individuality; on the contrary, — as negation of *immediacy* and individuality the result involves a character of universality and of the identity of self-consciousness with its object. The judgment or diremption of this self-consciousness is the consciousness of a "*free*" object, in which ego is aware of itself as an ego, which however is *also* still outside it.

(β) Self-consciousness Recognitive[132].

§ 430. Here there is a self-consciousness for a self-consciousness, at first immediately as one of two things for another. In that other as ego I behold myself, and yet also an immediately existing object, another ego absolutely independent of me and opposed to me. (The suppression of the singleness of self-consciousness was only a first step in the suppression, and it merely led to the characterisation of it as *particular*.) This contradiction gives either self-consciousness the impulse to *show* itself as a free self, and to exist as such for the other: — the process of *recognition*.

§ 431. The process is a battle. I cannot be aware of me as myself in another individual, so long as I see in that other an other and an immediate existence: and I am consequently bent upon the suppression of this immediacy of his. But in like measure *I* cannot be recognised as immediate, except so far as I overcome the mere immediacy on my own part, and thus give existence to my freedom. But this immediacy is at the same time the corporeity of self-consciousness, in which as in its sign and tool the latter has its own *sense of self*, and its being *for others*, and the means for entering into relation with them.

§ 432. The fight of recognition is a life and death struggle: either self-consciousness imperils the other's like, and incurs a like peril for its own — but only peril, for either is no less bent on maintaining his life, as the existence of his freedom. Thus the death of one, though by the abstract, therefore rude, negation of immediacy, it, from one point of view, solves the

contradiction, is yet, from the essential point of view (i.e. the outward and visible recognition), a new contradiction (for that recognition is at the same time undone by the other's death) and a greater than the other.

§ 433. But because life is as requisite as liberty to the solution, the fight ends in the first instance as a one-sided negation with inequality. While the one combatant prefers life, retains his single self-consciousness, but surrenders his claim for recognition, the other holds fast to his self-assertion and is recognised by the former as his superior. Thus arises the status of *master and slave*.

In the battle for recognition and the subjugation under a master, we see, on their phenomenal side, the emergence of man's social life and the commencement of political union. *Force*, which is the basis of this phenomenon, is not on that account a basis of right, but only the necessary and legitimate factor in the passage from the state of self-consciousness sunk in appetite and selfish isolation into the state of universal self-consciousness. Force, then, is the external or phenomenal commencement of states, not their underlying and essential principle.

§ 434. This status, in the first place, implies *common* wants and common concern for their satisfaction, — for the means of mastery, the slave, must likewise be kept in life. In place of the rude destruction of the immediate object there ensues acquisition, preservation, and formation of it, as the instrumentality in which the two extremes of independence and non-independence are welded together. The form of universality thus arising in satisfying the want, creates a *permanent* means and a provision which takes care for and secures the future.

§ 435. But secondly, when we look to the distinction of the two, the master beholds in the slave and his servitude the supremacy of his *single* self-hood, and that by the suppression of immediate self-hood, a

suppression, however, which falls on another. This other, the slave, however, in the service of the master, works off his individualist self-will, overcomes the inner immediacy of appetite, and in this divestment of self and in “the fear of his lord” makes “the beginning of wisdom” — the passage to universal self-consciousness.

(γ) Universal Self-consciousness.

§ 436. Universal self-consciousness is the affirmative awareness of self in an other self: each self as a free individuality has his own “absolute” independence, yet in virtue of the negation of its immediacy or appetite without distinguishing itself from that other. Each is thus universal self-conscious and objective; each has “real” universality in the shape of reciprocity, so far as each knows itself recognised in the other freeman, and is aware of this in so far as it recognises the other and knows him to be free.

This universal re-appearance of self-consciousness — the notion which is aware of itself in its objectivity as a subjectivity identical with itself and for that reason universal — is the form of consciousness which lies at the root of all true mental or spiritual life — in family, fatherland, state, and of all virtues, love, friendship, valour, honour, fame. But this appearance of the underlying essence may be severed from that essential, and be maintained apart in worthless honour, idle fame, &c.

§ 437. This unity of consciousness and self-consciousness implies in the first instance the individuals mutually throwing light upon each other. But the difference between those who are thus identified is mere vague diversity — or rather it is a difference which is none. Hence its truth is the fully and really existent universality and objectivity of self-consciousness, — which is *Reason*.

Reason, as the *Idea* (§ 213) as it here appears, is to be taken as meaning that the distinction between notion and reality which it unifies has the

special aspect of a distinction between the self-concentrated notion or consciousness, and the object subsisting external and opposed to it.

(c) Reason[133].

§ 438. The essential and actual truth which reason is, lies in the simple identity of the subjectivity of the notion, with its objectivity and universality. The universality of reason, therefore, whilst it signifies that the object, which was only given in consciousness *quâ* consciousness, is now itself universal, permeating and encompassing the ego, also signifies that the pure ego is the pure form which overlaps the object, and encompasses it without it.

§ 439. Self-consciousness, thus certified that its determinations are no less objective, or determinations of the very being of things, than they are its own thoughts, is Reason, which as such an identity is not only the absolute *substance*, but the *truth* that knows it. For truth here has, as its peculiar mode and immanent form, the self-centred pure notion, ego, the certitude of self as infinite universality. Truth, aware of what it is, is mind (spirit).

Sub-Section C. Psychology. Mind[134].

§ 440. MIND has defined itself as the truth of soul and consciousness, — the former a simple immediate totality, the latter now an infinite form which is not, like consciousness, restricted by that content, and does not stand in mere correlation to it as to its object, but is an awareness of this substantial totality, neither subjective nor objective. Mind, therefore, starts only from its own being and is in correlation only with its own features.

Psychology accordingly studies the faculties or general modes of mental activity *quâ* mental — mental vision, ideation, remembering, &c., desires, &c. — apart both from the content, which on the phenomenal side is found in empirical ideation, in thinking also and in desire and will, and from the two forms in which these modes exist, viz. in the soul as a physical mode, and in consciousness itself as a separately existent object of that consciousness. This, however, is not an arbitrary abstraction by the psychologist. Mind is just this elevation above nature and physical modes, and above the complication with an external object — in one word, above the material, as its concept has just shown. All it has now to do is to realise this notion of its freedom, and get rid of the *form* of immediacy with which it once more begins. The content which is elevated to intuitions is *its* sensations: it is *its* intuitions also which are transmuted into representations, and its representations which are transmuted again into thoughts, &c.

§ 441. The soul is finite, so far as its features are immediate or con-natural. Consciousness is finite, in so far as it has an object. Mind is finite, in so far as, though it no longer has an object, it has a mode in its knowledge; i.e., it is finite by means of its immediacy, or, what is the same thing, by being subjective or only a notion. And it is a matter of no

consequence, which is defined as its notion, and which as the reality of that notion. Say that its notion is the utterly infinite objective reason, then its reality is knowledge or *intelligence*: say that knowledge is its notion, then its reality is that reason, and the realisation of knowledge consists in appropriating reason. Hence the finitude of mind is to be placed in the (temporary) failure of knowledge to get hold of the full reality of its reason, or, equally, in the (temporary) failure of reason to attain full manifestation in knowledge. Reason at the same time is only infinite so far as it is "absolute" freedom; so far, that is, as presupposing itself for its knowledge to work upon, it thereby reduces itself to finitude, and appears as everlasting movement of superseding this immediacy, of comprehending itself, and being a rational knowledge.

§ 442. The progress of mind is *development*, in so far as its existent phase, viz. knowledge, involves as its intrinsic purpose and burden that utter and complete autonomy which is rationality; in which case the action of translating this purpose into reality is strictly only a nominal passage over into manifestation, and is even there a return into itself. So far as knowledge which has not shaken off its original quality of *mere* knowledge is only abstract or formal, the goal of mind is to give it objective fulfilment, and thus at the same time produce its freedom.

The development here meant is not that of the individual (which has a certain *anthropological* character), where faculties and forces are regarded as successively emerging and presenting themselves in external existence — a series of steps, on the ascertainment on which there was for a long time great stress laid (by the system of Condillac), as if a conjectural natural emergence could exhibit the origin of these faculties and *explain* them. In Condillac's method there is an unmistakable intention to show how the *several* modes of mental activity could be made intelligible without losing sight of mental unity, and to exhibit their necessary interconnexion. But the

categories employed in doing so are of a wretched sort. Their ruling principle is that the sensible is taken (and with justice) as the *prius* or the initial basis, but that the later phases that follow this starting-point present themselves as emerging in a solely *affirmative* manner, and the negative aspect of mental activity, by which this material is transmuted into mind and destroyed *as* a sensible, is misconceived and overlooked. As the theory of Condillac states it, the sensible is not merely the empirical first, but is left as if it were the true and essential foundation.

Similarly, if the activities of mind are treated as mere manifestations, forces, perhaps in terms stating their utility or suitability for some other interest of head or heart, there is no indication of the true final aim of the whole business. That can only be the intelligible unity of mind, and its activity can only have itself as aim; i.e. its aim can only be to get rid of the form of immediacy or subjectivity, to reach and get hold of itself, and to liberate itself to itself. In this way the so-called faculties of mind as thus distinguished are only to be treated as steps of this liberation. And this is the only *rational* mode of studying the mind and its various activities.

§ 443. As consciousness has for its object the stage which preceded it, viz. the natural soul (§ 413), so mind has or rather makes consciousness its object: i.e. whereas consciousness is only the virtual identity of the ego with its other (§ 415), the mind realises that identity as the concrete unity which it and it only knows. Its productions are governed by the principle of all reason that the contents are at once potentially existent, and are the mind's own, in freedom. Thus, if we consider the initial aspect of mind, that aspect is twofold — as *being* and as *its own*: by the one, the mind finds in itself something which *is*, by the other it affirms it to be only *its own*. The way of mind is therefore

(*a*) to be theoretical: it has to do with the rational as its immediate affection which it must render its own: or it has to free knowledge from its

pre-supposedness and therefore from its abstractness, and make the affection subjective. When the affection has been rendered its own, and the knowledge consequently characterised as free intelligence, i.e. as having its full and free characterisation in itself, it is

(*b*) Will: *practical* mind, which in the first place is likewise formal — i.e. its content is at first *only* its own, and is immediately willed; and it proceeds next to liberate its volition from its subjectivity, which is the one-sided form of its contents, so that it

(*c*) confronts itself as free mind and thus gets rid of both its defects of one-sidedness.

§ 444. The theoretical as well as the practical mind still fall under the general range of Mind Subjective. They are not to be distinguished as active and passive. Subjective mind is productive: but it is a merely nominal productivity. Inwards, the theoretical mind produces only its "ideal" world, and gains abstract autonomy within; while the practical, while it has to do with autonomous products, with a material which is its own, has a material which is only nominally such, and therefore a restricted content, for which it gains the form of universality. Outwards, the subjective mind (which as a unity of soul and consciousness, is thus also a reality, — a reality at once anthropological and conformable to consciousness) has for its products, in the theoretical range, the *word*, and in the practical (not yet deed and action, but) *enjoyment*.

Psychology, like logic, is one of those sciences which in modern times have yet derived least profit from the more general mental culture and the deeper conception of reason. It is still extremely ill off. The turn which the Kantian philosophy has taken has given it greater importance: it has, and that in its empirical condition, been claimed as the basis of metaphysics, which is to consist of nothing but the empirical apprehension and the

analysis of the facts of human consciousness, merely as facts, just as they are given. This position of psychology, mixing it up with forms belonging to the range of consciousness and with anthropology, has led to no improvement in its own condition: but it has had the further effect that, both for the mind as such, and for metaphysics and philosophy generally, all attempts have been abandoned to ascertain the necessity of essential and actual reality, to get at the notion and the truth.

(a) Theoretical mind.

§ 445. Intelligence[135] *finds* itself determined: this is its apparent aspect from which in its immediacy it starts. But as knowledge, intelligence consists in treating what is found as its own. Its activity has to do with the empty form — the pretence of *finding* reason: and its aim is to realise its concept or to be reason actual, along with which the content is realised as rational. This activity is *cognition*. The nominal knowledge, which is only certitude, elevates itself, as reason is concrete, to definite and conceptual knowledge. The course of this elevation is itself rational, and consists in a necessary passage (governed by the concept) of one grade or term of intelligent activity (a so-called faculty of mind) into another. The refutation which such cognition gives of the semblance that the rational is *found*, starts from the certitude or the faith of intelligence in its capability of rational knowledge, and in the possibility of being able to appropriate the reason, which it and the content virtually is.

The distinction of Intelligence from Will is often incorrectly taken to mean that each has a fixed and separate existence of its own, as if volition could be without intelligence, or the activity of intelligence could be without will. The possibility of a culture of the intellect which leaves the heart untouched, as it is said, and of the heart without the intellect — of

hearts which in one-sided way want intellect, and heartless intellects — only proves at most that bad and radically untrue existences occur. But it is not philosophy which should take such untruths of existence and of mere imagining for truth — take the worthless for the essential nature. A host of other phrases used of intelligence, e.g. that it receives and accepts impressions from outside, that ideas arise through the causal operations of external things upon it, &c., belong to a point of view utterly alien to the mental level or to the position of philosophic study.

A favourite reflectional form is that of powers and faculties of soul, intelligence, or mind. Faculty, like power or force, is the fixed quality of any object of thought, conceived as reflected into self. Force (§ 136) is no doubt the infinity of form — of the inward and the outward: but its essential finitude involves the indifference of content to form (ib. note). In this lies the want of organic unity which by this reflectional form, treating mind as a "lot" of forces, is brought into mind, as it is by the same method brought into nature. Any aspect which can be distinguished in mental action is stereotyped as an independent entity, and the mind thus made a skeleton-like mechanical collection. It makes absolutely no difference if we substitute the expression "activities" for powers and faculties. Isolate the activities and you similarly make the mind a mere aggregate, and treat their essential correlation as an external incident.

The action of intelligence as theoretical mind has been called *cognition* (knowledge). Yet this does not mean intelligence *inter alia* knows, — besides which it also intuites, conceives, remembers, imagines, &c. To take up such a position is in the first instance part and parcel of that isolating of mental activity just censured; but it is also in addition connected with the great question of modern times, as to whether true knowledge or the knowledge of truth is possible, — which, if answered in the negative, must lead to abandoning the effort. The numerous aspects and reasons and modes

of phrase with which external reflection swells the bulk of this question are cleared up in their place: the more external the attitude of understanding in the question, the more diffuse it makes a simple object. At the present place the simple concept of cognition is what confronts the quite general assumption taken up by the question, viz. the assumption that the possibility of true knowledge in general is in dispute, and the assumption that it is possible for us at our will either to prosecute or to abandon cognition. The concept or possibility of cognition has come out as intelligence itself, as the certitude of reason: the act of cognition itself is therefore the actuality of intelligence. It follows from this that it is absurd to speak of intelligence and yet at the same time of the possibility or choice of knowing or not. But cognition is genuine, just so far as it realises itself, or makes the concept its own. This nominal description has its concrete meaning exactly where cognition has it. The stages of its realising activity are intuition, conception, memory, &c.: these activities have no other immanent meaning: their aim is solely the concept of cognition (§ 445 note). If they are isolated, however, then an impression is implied that they are useful for something else than cognition, or that they severally procure a cognitive satisfaction of their own; and that leads to a glorification of the delights of intuition, remembrance, imagination. It is true that even as isolated (i.e. as non-intelligent), intuition, imagination, &c. can afford a certain satisfaction: what physical nature succeeds in doing by its fundamental quality — its out-of-selfness, — exhibiting the elements or factors of immanent reason external to each other, — that the intelligence can do by voluntary act, but the same result may happen where the intelligence is itself only natural and untrained. But the *true satisfaction*, it is admitted, is only afforded by an intuition permeated by intellect and mind, by rational conception, by products of imagination which are permeated by reason and exhibit ideas — in a word, by *cognitive* intuition, cognitive conception, &c. The truth

ascribed to such satisfaction lies in this, that intuition, conception, &c. are not isolated, and exist only as "moments" in the totality of cognition itself.

(α) Intuition (Intelligent Perception)[136].

§ 446. The mind which as soul is physically conditioned, — which as consciousness stands to this condition on the same terms as to an outward object, — but which as intelligence *finds itself* so characterised — is (1) an inarticulate embryonic life, in which it is to itself as it were palpable and has the whole *material* of its knowledge. In consequence of the immediacy in which it is thus originally, it is in this stage only as an individual and possesses a vulgar subjectivity. It thus appears as mind in the guise of *feeling*.

If feeling formerly turned up (§ 399) as a mode of the *soul's* existence, the finding of it or its immediacy was in that case essentially to be conceived as a congenital or corporeal condition; whereas at present it is only to be taken abstractly in the general sense of immediacy.

§ 447. The characteristic form of feeling is that though it is a mode of some "affection," this mode is simple. Hence feeling, even should its import be most sterling and true, has the form of casual particularity, — not to mention that its import may also be the most scanty and most untrue.

It is commonly enough assumed that mind has in its feeling the material of its ideas, but the statement is more usually understood in a sense the opposite of that which it has here. In contrast with the simplicity of feeling it is usual rather to assume that the primary mental phase is judgment generally, or the distinction of consciousness into subject and object; and the special quality of sensation is derived from an independent *object*, external or internal. With us, in the truth of mind, the mere consciousness point of view, as opposed to true mental "idealism," is swallowed up, and the matter of feeling has rather been supposed already as *immanent* in the

mind. — It is commonly taken for granted that as regards content there is more in feeling than in thought: this being specially affirmed of moral and religious feelings. Now the material, which the mind as it feels is to itself, is *here* the result and the mature result of a fully organised reason: hence under the head of feeling is comprised all rational and indeed all spiritual content whatever. But the form of selfish singleness to which feeling reduces the mind is the lowest and worst vehicle it can have — one in which it is not found as a free and infinitely universal principle, but rather as subjective and private, in content and value entirely contingent. Trained and sterling feeling is the feeling of an educated mind which has acquired the consciousness of the true differences of things, of their essential relationships and real characters; and it is with such a mind that this rectified material enters into its feeling and receives this form. Feeling is the immediate, as it were the closest, contact in which the thinking subject can stand to a given content. Against that content the subject re-acts first of all with its particular self-feeling, which though it *may* be of more sterling value and of wider range than a onesided intellectual standpoint, may just as likely be narrow and poor; and in any case is the form of the particular and subjective. If a man on any topic appeals not to the nature and notion of the thing, or at least to reasons — to the generalities of common sense — but to his feeling, the only thing to do is to let him alone, because by his behaviour he refuses to have any lot or part in common rationality, and shuts himself up in his own isolated subjectivity — his private and particular self.

§ 448. (2) As this immediate finding is broken up into elements, we have the one factor in *Attention* — the abstract *identical* direction of mind (in feeling, as also in all other more advanced developments of it) — an active self-collection — the factor of fixing it as our own, but with an as yet only nominal autonomy of intelligence. Apart from such attention there is nothing for the mind. The other factor is to invest the special quality of

feeling, as contrasted with this inwardness of mind, with the character of something existent, but as a *negative* or as the abstract otherness of itself. Intelligence thus defines the content of sensation as something that is out of itself, projects it into time and space, which are the forms in which it is intuitive. To the view of consciousness the material is only an object of consciousness, a relative other: from mind it receives the rational characteristic of being *its very other* (§§ 147, 254).

§ 449. (3) When intelligence reaches a concrete unity of the two factors, that is to say, when it is at once self-collected in this externally existing material, and yet in this self-collectedness sunk in the out-of-selfness, it is *Intuition* or Mental Vision.

§ 450. At and towards this its own out-of-selfness, intelligence no less essentially directs its attention. In this its immediacy it is an awaking to itself, a recollection of itself. Thus intuition becomes a concretion of the material with the intelligence, which makes it its own, so that it no longer needs this immediacy, no longer needs to find the content.

(β) Representation (or Mental Idea)[137].

§ 451. Representation is this recollected or inwardised intuition, and as such is the middle between that stage of intelligence where it finds itself immediately subject to modification and that where intelligence is in its freedom, or, as thought. The representation is the property of intelligence; with a preponderating subjectivity, however, as its right of property is still conditioned by contrast with the immediacy, and the representation cannot as it stands be said to *be*. The path of intelligence in representations is to render the immediacy inward, to invest itself with intuitive action in itself, and at the same time to get rid of the subjectivity of the inwardness, and inwardly divest itself of it; so as to be in itself in an externality of its own. But as representation begins from intuition and the ready-found material of

intuition, the intuitional contrast still continues to affect its activity, and makes its concrete products still "syntheses," which do not grow to the concrete immanence of the notion till they reach the stage of thought.

(αα) Recollection[138].

§ 452. Intelligence, as it at first recollects the intuition, places the content of feeling in its own inwardness — in a space and a time of its own. In this way that content is (1) an *image* or picture, liberated from its original immediacy and abstract singleness amongst other things, and received into the universality of the ego. The image loses the full complement of features proper to intuition, and is arbitrary or contingent, isolated, we may say, from the external place, time, and immediate context in which the intuition stood.

§ 453. (2) The image is of itself transient, and intelligence itself is as attention its time and also its place, its when and where. But intelligence is not only consciousness and actual existence, but *quâ* intelligence is the subject and the potentiality of its own specialisations. The image when thus kept in mind is no longer existent, but stored up out of consciousness.

To grasp intelligence as this night-like mine or pit in which is stored a world of infinitely many images and representations, yet without being in consciousness, is from the one point of view the universal postulate which bids us treat the notion as concrete, in the way we treat e.g. the germ as affirmatively containing, in virtual possibility, all the qualities that come into existence in the subsequent development of the tree. Inability to grasp a universal like this, which, though intrinsically concrete, still continues *simple*, is what has led people to talk about special fibres and areas as receptacles of particular ideas. It was felt that what was diverse should in the nature of things have a local habitation peculiar to itself. But whereas the reversion of the germ from its existing specialisations to its simplicity in

a purely potential existence takes place only in another germ, — the germ of the fruit; intelligence *quâ* intelligence shows the potential coming to free existence in its development, and yet at the same time collecting itself in its inwardness. Hence from the other point of view intelligence is to be conceived as this sub-conscious mine, i.e. as the *existent* universal in which the different has not yet been realised in its separations. And it is indeed this potentiality which is the first form of universality offered in mental representation.

§ 454. (3) An image thus abstractly treasured up needs, if it is to exist, an actual intuition: and what is strictly called Remembrance is the reference of the image to an intuition, — and that as a subsumption of the immediate single intuition (impression) under what is in point of form universal, under the representation (idea) with the same content. Thus intelligence recognises the specific sensation and the intuition of it as what is already its own, — in them it is still within itself: at the same time it is aware that what is only its (primarily) internal image is also an immediate object of intuition, by which it is authenticated. The image, which in the mine of intelligence was only its *property*, now that it has been endued with externality, comes actually into its *possession*. And so the image is at once rendered distinguishable from the intuition and separable from the blank night in which it was originally submerged. Intelligence is thus the force which can give forth its property, and dispense with external intuition for its existence in it. This "synthesis" of the internal image with the recollected existence is *representation* proper: by this synthesis the internal now has the qualification of being able to be presented before intelligence and to have its existence in it.

(ββ) Imagination[139].

§ 455. (1) The intelligence which is active in this possession is the *reproductive imagination*, where the images issue from the inward world belonging to the ego, which is now the power over them. The images are in the first instance referred to this external, immediate time and space which is treasured up along with them. But it is solely in the conscious subject, where it is treasured up, that the image has the individuality in which the features composing it are conjoined: whereas their original concretion, i.e. at first only in space and time, as a *unit* of intuition, has been broken up. The content reproduced, belonging as it does to the self-identical unity of intelligence, and an out-put from its universal mine, has a general idea (representation) to supply the link of association for the images which according to circumstances are more abstract or more concrete ideas.

The so-called *laws of the association of ideas* were objects of great interest, especially during that outburst of empirical psychology which was contemporaneous with the decline of philosophy. In the first place, it is not *Ideas* (properly so called) which are associated. Secondly, these modes of relation are not *laws*, just for the reason that there are so many laws about the same thing, as to suggest a caprice and a contingency opposed to the very nature of law. It is a matter of chance whether the link of association is something pictorial, or an intellectual category, such as likeness and contrast, reason and consequence. The train of images and representations suggested by association is the sport of vacant-minded ideation, where, though intelligence shows itself by a certain formal universality, the matter is entirely pictorial. — Image and idea, if we leave out of account the more precise definition of those forms given above, present also a distinction in content. The former is the more consciously-concrete idea, whereas the idea (representation), whatever be its content (from image, notion, or idea), has always the peculiarity, though belonging to intelligence, of being in respect of its content given and immediate. It is still true of this idea or

representation, as of all intelligence, that it finds its material, as a matter of fact, to *be* so and so; and the universality which the aforesaid material receives by ideation is still abstract. Mental representation is the mean in the syllogism of the elevation of intelligence, the link between the two significations of self-relatedness — viz. *being* and *universality*, which in consciousness receive the title of object and subject. Intelligence complements what is merely found by the attribution of universality, and the internal and its own by the attribution of being, but a being of its own institution. (On the distinction of representations and thoughts, see Introd. to the Logic, § 20 note.)

Abstraction, which occurs in the ideational activity by which general ideas are produced (and ideas *quâ* ideas virtually have the form of generality), is frequently explained as the incidence of many similar images one upon another and is supposed to be thus made intelligible. If this super-imposing is to be no mere accident and without principle, a force of attraction in like images must be assumed, or something of the sort, which at the same time would have the negative power of rubbing off the dissimilar elements against each other. This force is really intelligence itself, — the self-identical ego which by its internalising recollection gives the images *ipso facto* generality, and subsumes the single intuition under the already internalised image (§ 453).

§ 456. Thus even the association of ideas is to be treated as a subsumption of the individual under the universal, which forms their connecting link. But here intelligence is more than merely a general form: its inwardness is an internally definite, concrete subjectivity with a substance and value of its own, derived from some interest, some latent concept or Ideal principle, so far as we may by anticipation speak of such. Intelligence is the power which wields the stores of images and ideas belonging to it, and which thus (2) freely combines and subsumes these

stores in obedience to its peculiar tenor. Such is creative imagination[140] — symbolic, allegoric, or poetical imagination — where the intelligence gets a definite embodiment in this store of ideas and informs them with its general tone. These more or less concrete, individualised creations are still "syntheses": for the material, in which the subjective principles and ideas get a mentally pictorial existence, is derived from the data of intuition.

§ 457. In creative imagination intelligence has been so far perfected as to need no helps for intuition. Its self-sprung ideas have pictorial existence. This pictorial creation of its intuitive spontaneity is subjective — still lacks the side of existence. But as the creation unites the internal idea with the vehicle of materialisation, intelligence has therein *implicitly* returned both to identical self-relation and to immediacy. As reason, its first start was to appropriate the immediate datum in itself (§§ 445, 455), i.e. to universalise it; and now its action as reason (§ 458) is from the present point directed towards giving the character of an existent to what in it has been perfected to concrete auto-intuition. In other words, it aims at making itself *be* and be a fact. Acting on this view, it is self-uttering, intuition-producing: the imagination which creates signs.

Productive imagination is the centre in which the universal and being, one's own and what is picked up, internal and external, are completely welded into one. The preceding "syntheses" of intuition, recollection, &c., are unifications of the same factors, but they are "syntheses"; it is not till creative imagination that intelligence ceases to be the vague mine and the universal, and becomes an individuality, a concrete subjectivity, in which the self-reference is defined both to being and to universality. The creations of imagination are on all hands recognised as such combinations of the mind's own and inward with the matter of intuition; what further and more definite aspects they have is a matter for other departments. For the present this internal studio of intelligence is only to be looked at in these abstract

aspects. — Imagination, when regarded as the agency of this unification, is reason, but only a nominal reason, because the matter or theme it embodies is to imagination *quâ* imagination a matter of indifference; whilst reason *quâ* reason also insists upon the *truth* of its content.

Another point calling for special notice is that, when imagination elevates the internal meaning to an image and intuition, and this is expressed by saying that it gives the former the character of an *existent*, the phrase must not seem surprising that intelligence makes itself *be* as a *thing*; for its ideal import is itself, and so is the aspect which it imposes upon it. The image produced by imagination of an object is a bare mental or subjective intuition: in the sign or symbol it adds intuitability proper; and in mechanical memory it completes, so far as it is concerned, this form of *being*.

§ 458. In this unity (initiated by intelligence) of an independent representation with an intuition, the matter of the latter is, in the first instance, something accepted, somewhat immediate or given (e.g. the colour of the cockade, &c.). But in the fusion of the two elements, the intuition does not count positively or as representing itself, but as representative of something else. It is an image, which has received as its soul and meaning an independent mental representation. This intuition is the *Sign*.

The sign is some immediate intuition, representing a totally different import from what naturally belongs to it; it is the pyramid into which a foreign soul has been conveyed, and where it is conserved. The *sign* is different from the *symbol*: for in the symbol the original characters (in essence and conception) of the visible object are more or less identical with the import which it bears as symbol; whereas in the sign, strictly so-called, the natural attributes of the intuition, and the connotation of which it is a

sign, have nothing to do with each other. Intelligence therefore gives proof of wider choice and ampler authority in the use of intuitions when it treats them as designatory (significative) rather than as symbolical.

In logic and psychology, signs and language are usually foisted in somewhere as an appendix, without any trouble being taken to display their necessity and systematic place in the economy of intelligence. The right place for the sign is that just given: where intelligence — which as intuiting generates the form of time and space, but is apparently recipient of sensible matter, out of which it forms ideas — now gives its own original ideas a definite existence from itself, treating the intuition (or time and space as filled full) as its own property, deleting the connotation which properly and naturally belongs to it, and conferring on it an other connotation as its soul and import. This sign-creating activity may be distinctively named "productive" Memory (the primarily abstract "Mnemosyne"); since memory, which in ordinary life is often used as interchangeable and synonymous with remembrance (recollection), and even with conception and imagination, has always to do with signs only.

§ 459. The intuition — in its natural phase a something given and given in space — acquires, when employed as a sign, the peculiar characteristic of existing only as superseded and sublimated. Such is the negativity of intelligence; and thus the truer phase of the intuition used as a sign is existence in *time* (but its existence vanishes in the moment of being), and if we consider the rest of its external psychical quality, its *institution* by intelligence, but an institution growing out of its (anthropological) own naturalness. This institution of the natural is the vocal note, where the inward idea manifests itself in adequate utterance. The vocal note which receives further articulation to express specific ideas — speech and, its system, language — gives to sensations, intuitions, conceptions, a second

and higher existence than they naturally possess, — invests them with the right of existence in the ideational realm.

Language here comes under discussion only in the special aspect of a product of intelligence for manifesting its ideas in an external medium. If language had to be treated in its concrete nature, it would be necessary for its vocabulary or material part to recall the anthropological or psycho-physiological point of view (§ 401), and for the grammar or formal portion to anticipate the standpoint of analytic understanding. With regard to the elementary *material* of language, while on one hand the theory of mere accident has disappeared, on the other the principle of imitation has been restricted to the slight range it actually covers — that of vocal objects. Yet one may still hear the German language praised for its wealth — that wealth consisting in its special expression for special sounds — *Rauschen*, *Sausen*, *Knarren*, &c.; — there have been collected more than a hundred such words, perhaps: the humour of the moment creates fresh ones when it pleases. Such superabundance in the realm of sense and of triviality contributes nothing to form the real wealth of a cultivated language. The strictly raw material of language itself depends more upon an inward symbolism than a symbolism referring to external objects; it depends, i.e. on anthropological articulation, as it were the posture in the corporeal act of oral utterance. For each vowel and consonant accordingly, as well as for their more abstract elements (the posture of lips, palate, tongue in each) and for their combinations, people have tried to find the appropriate signification. But these dull sub-conscious beginnings are deprived of their original importance and prominence by new influences, it may be by external agencies or by the needs of civilisation. Having been originally sensuous intuitions, they are reduced to signs, and thus have only traces left of their original meaning, if it be not altogether extinguished. As to the *formal* element, again, it is the work of analytic intellect which informs

language with its categories: it is this logical instinct which gives rise to grammar. The study of languages still in their original state, which we have first really begun to make acquaintance with in modern times, has shown on this point that they contain a very elaborate grammar and express distinctions which are lost or have been largely obliterated in the languages of more civilised nations. It seems as if the language of the most civilised nations has the most imperfect grammar, and that the same language has a more perfect grammar when the nation is in a more uncivilised state than when it reaches a higher civilisation. (Cf. W. von Humboldt's *Essay on the Dual*.)

In speaking of vocal (which is the original) language, we may touch, only in passing, upon written language, — a further development in the particular sphere of language which borrows the help of an externally practical activity. It is from the province of immediate spatial intuition to which written language proceeds that it takes and produces the signs (§ 454). In particular, hieroglyphics uses spatial figures to designate *ideas*; alphabetical writing, on the other hand, uses them to designate vocal notes which are already signs. Alphabetical writing thus consists of signs of signs, — the words or concrete signs of vocal language being analysed into their simple elements, which severally receive designation. — Leibnitz's practical mind misled him to exaggerate the advantages which a complete written language, formed on the hieroglyphic method (and hieroglyphics are used even where there is alphabetic writing, as in our signs for the numbers, the planets, the chemical elements, &c.), would have as a universal language for the intercourse of nations and especially of scholars. But we may be sure that it was rather the intercourse of nations (as was probably the case in Phoenicia, and still takes place in Canton — see *Macartney's Travels* by Staunton) which occasioned the need of alphabetical writing and led to its formation. At any rate a comprehensive hieroglyphic language for

ever completed is impracticable. Sensible objects no doubt admit of permanent signs; but, as regards signs for mental objects, the progress of thought and the continual development of logic lead to changes in the views of their internal relations and thus also of their nature; and this would involve the rise of a new hieroglyphical denotation. Even in the case of sense-objects it happens that their names, i.e. their signs in vocal language, are frequently changed, as e.g. in chemistry and mineralogy. Now that it has been forgotten what names properly are, viz. externalities which of themselves have no sense, and only get signification as signs, and now that, instead of names proper, people ask for terms expressing a sort of definition, which is frequently changed capriciously and fortuitously, the denomination, i.e. the composite name formed of signs of their generic characters or other supposed characteristic properties, is altered in accordance with the differences of view with regard to the genus or other supposed specific property. It is only a stationary civilisation, like the Chinese, which admits of the hieroglyphic language of that nation; and its method of writing moreover can only be the lot of that small part of a nation which is in exclusive possession of mental culture. — The progress of the vocal language depends most closely on the habit of alphabetical writing; by means of which only does vocal language acquire the precision and purity of its articulation. The imperfection of the Chinese vocal language is notorious: numbers of its words possess several utterly different meanings, as many as ten and twenty, so that, in speaking, the distinction is made perceptible merely by accent and intensity, by speaking low and soft or crying out. The European, learning to speak Chinese, falls into the most ridiculous blunders before he has mastered these absurd refinements of accentuation. Perfection here consists in the opposite of that *parler sans accent* which in Europe is justly required of an educated speaker. The hieroglyphic mode of writing keeps the Chinese vocal language from

reaching that objective precision which is gained in articulation by alphabetic writing.

Alphabetic writing is on all accounts the more intelligent: in it the *word* — the mode, peculiar to the intellect, of uttering its ideas most worthily — is brought to consciousness and made an object of reflection. Engaging the attention of intelligence, as it does, it is analysed; the work of sign-making is reduced to its few simple elements (the primary postures of articulation) in which the sense-factor in speech is brought to the form of universality, at the same time that in this elementary phase it acquires complete precision and purity. Thus alphabetic writing retains at the same time the advantage of vocal language, that the ideas have names strictly so called: the name is the simple sign for the exact idea, i.e. the simple plain idea, not decomposed into its features and compounded out of them. Hieroglyphics, instead of springing from the direct analysis of sensible signs, like alphabetic writing, arise from an antecedent analysis of ideas. Thus a theory readily arises that all ideas may be reduced to their elements, or simple logical terms, so that from the elementary signs chosen to express these (as, in the case of the Chinese *Koua*, the simple straight stroke, and the stroke broken into two parts) a hieroglyphic system would be generated by their composition. This feature of hieroglyphic — the analytical designations of ideas — which misled Leibnitz to regard it as preferable to alphabetic writing is rather in antagonism with the fundamental desideratum of language, — the name. To want a name means that for the immediate idea (which, however ample a connotation it may include, is still for the mind simple in the name), we require a simple immediate sign which for its own sake does not suggest anything, and has for its sole function to signify and represent sensibly the simple idea as such. It is not merely the image-loving and image-limited intelligence that lingers over the simplicity of ideas and redintegrates them from the more abstract factors into which they have been analysed: thought

too reduces to the form of a simple thought the concrete connotation which it “resumes” and reunites from the mere aggregate of attributes to which analysis has reduced it. Both alike require such signs, simple in respect of their meaning: signs, which though consisting of several letters or syllables and even decomposed into such, yet do not exhibit a combination of several ideas. — What has been stated is the principle for settling the value of these written languages. It also follows that in hieroglyphics the relations of concrete mental ideas to one another must necessarily be tangled and perplexed, and that the analysis of these (and the proximate results of such analysis must again be analysed) appears to be possible in the most various and divergent ways. Every divergence in analysis would give rise to another formation of the written name; just as in modern times (as already noted, even in the region of sense) muriatic acid has undergone several changes of name. A hieroglyphic written language would require a philosophy as stationary as is the civilisation of the Chinese.

What has been said shows the inestimable and not sufficiently appreciated educational value of learning to read and write an alphabetic character. It leads the mind from the sensibly concrete image to attend to the more formal structure of the vocal word and its abstract elements, and contributes much to give stability and independence to the inward realm of mental life. Acquired habit subsequently effaces the peculiarity by which alphabetic writing appears, in the interest of vision, as a roundabout way to ideas by means of audibility; it makes them a sort of hieroglyphic to us, so that in using them we need not consciously realise them by means of tones, whereas people unpractised in reading utter aloud what they read in order to catch its meaning in the sound. Thus, while (with the faculty which transformed alphabetic writing into hieroglyphics) the capacity of abstraction gained by the first practice remains, hieroglyphic reading is of itself a deaf reading and a dumb writing. It is true that the audible (which is

in time) and the visible (which is in space), each have their own basis, one no less authoritative than the other. But in the case of alphabetic writing there is only a *single* basis: the two aspects occupy their rightful relation to each other: the visible language is related to the vocal only as a sign, and intelligence expresses itself immediately and unconditionally by speaking. — The instrumental function of the comparatively non-sensuous element of tone for all ideational work shows itself further as peculiarly important in memory which forms the passage from representation to thought.

§ 460. The name, combining the intuition (an intellectual production) with its signification, is primarily a single transient product; and conjunction of the idea (which is inward) with the intuition (which is outward) is itself outward. The reduction of this outwardness to inwardness is (verbal) Memory.

(γγ) Memory[141].

§ 461. Under the shape of memory the course of intelligence passes through the same inwardising (recollecting) functions, as regards the intuition of the *word*, as representation in general does in dealing with the first immediate intuition (§ 451). (1) Making its own the synthesis achieved in the sign, intelligence, by this inwardising (memorising) elevates the *single* synthesis to a universal, i.e. permanent, synthesis, in which name and meaning are for it objectively united, and renders the intuition (which the name originally is) a representation. Thus the import (connotation) and sign, being identified, form one representation: the representation in its inwardness is rendered concrete and gets existence for its import: all this being the work of memory which retains names (retentive Memory).

§ 462. The name is thus the thing so far as it exists and counts in the ideational realm. (2) In the name, *Reproductive* memory has and recognises

the thing, and with the thing it has the name, apart from intuition and image. The name, as giving an *existence* to the content in intelligence, is the externality of intelligence to itself; and the inwardising or recollection of the name, i.e. of an intuition of intellectual origin, is at the same time a self-externalisation to which intelligence reduces itself on its own ground. The association of the particular names lies in the meaning of the features sensitive, representative, or cogitant, — series of which the intelligence traverses as it feels, represents, or thinks.

Given the name lion, we need neither the actual vision of the animal, nor its image even: the name alone, if we *understand* it, is the unimaged simple representation. We *think* in names.

The recent attempts — already, as they deserved, forgotten — to rehabilitate the Mnemonic of the ancients, consist in transforming names into images, and thus again deposing memory to the level of imagination. The place of the power of memory is taken by a permanent tableau of a series of images, fixed in the imagination, to which is then attached the series of ideas forming the composition to be learned by rote. Considering the heterogeneity between the import of these ideas and those permanent images, and the speed with which the attachment has to be made, the attachment cannot be made otherwise than by shallow, silly, and utterly accidental links. Not merely is the mind put to the torture of being worried by idiotic stuff, but what is thus learnt by rote is just as quickly forgotten, seeing that the same tableau is used for getting by rote every other series of ideas, and so those previously attached to it are effaced. What is mnemonically impressed is not like what is retained in memory really got by heart, i.e. strictly produced from within outwards, from the deep pit of the ego, and thus recited, but is, so to speak, read off the tableau of fancy. — Mnemonic is connected with the common prepossession about memory, in comparison with fancy and imagination; as if the latter were a higher and

more intellectual activity than memory. On the contrary, memory has ceased to deal with an image derived from intuition, — the immediate and incomplete mode of intelligence; it has rather to do with an object which is the product of intelligence itself, — such a *without book*[142] as remains locked up in the *within-book*[143] of intelligence, and is, within intelligence, only its outward and existing side.

§ 463. (3) As the interconnexion of the names lies in the meaning, the conjunction of their meaning with the reality as names is still an (external) synthesis; and intelligence in this its externality has not made a complete and simple return into self. But intelligence is the universal, — the single plain truth of its particular self-divestments; and its consummated appropriation of them abolishes that distinction between meaning and name. This extreme inwardising of representation is the supreme self-divestment of intelligence, in which it renders itself the mere *being*, the universal space of names as such, i.e. of meaningless words. The ego, which is this abstract being, is, because subjectivity, at the same time the power over the different names, — the link which, having nothing in itself, fixes in itself series of them and keeps them in stable order. So far as they merely *are*, and intelligence is here itself this *being* of theirs, its power is a merely abstract subjectivity, — memory; which, on account of the complete externality in which the members of such series stand to one another, and because it is itself this externality (subjective though that be), is called mechanical (§ 195).

A composition is, as we know, not thoroughly conned by rote, until one attaches no meaning to the words. The recitation of what has been thus got by heart is therefore of course accentless. The correct accent, if it is introduced, suggests the meaning: but this introduction of the signification of an idea disturbs the mechanical nexus and therefore easily throws out the reciter. The faculty of conning by rote series of words, with no principle

governing their succession, or which are separately meaningless, e.g. a series of proper names, is so supremely marvellous, because it is the very essence of mind to have its wits about it; whereas in this case the mind is estranged in itself, and its action is like machinery. But it is only as uniting subjectivity with objectivity that the mind has its wits about it. Whereas in the case before us, after it has in intuition been at first so external as to pick up its facts ready-made, and in representation inwardises or recollects this datum and makes it its own, — it proceeds as memory to make itself external in itself, so that what is its own assumes the guise of something found. Thus one of the two dynamic factors of thought, viz. objectivity, is here put in intelligence itself as a quality of it. — It is only a step further to treat memory as mechanical — the act implying no intelligence — in which case it is only justified by its uses, its indispensability perhaps for other purposes and functions of mind. But by so doing we overlook the proper signification it has in the mind.

§ 464. If it is to be the fact and true objectivity, the mere name as an existent requires something else, — to be interpreted by the representing intellect. Now in the shape of mechanical memory, intelligence is at once that external objectivity and the meaning. In this way intelligence is explicitly made an *existence* of this identity, i.e. it is explicitly active as such an identity which as reason it is implicitly. Memory is in this manner the passage into the function of *thought*, which no longer has a *meaning*, i.e. its objectivity is no longer severed from the subjective, and its inwardness does not need to go outside for its existence.

The German language has etymologically assigned memory (*Gedächtniß*), of which it has become a foregone conclusion to speak contemptuously, the high position of direct kindred with thought (*Gedanke*). — It is not matter of chance that the young have a better memory than the old, nor is their memory solely exercised for the sake of utility. The young

have a good memory because they have not yet reached the stage of reflection; their memory is exercised with or without design so as to level the ground of their inner life to pure being or to pure space in which the fact, the implicit content, may reign and unfold itself with no antithesis to a subjective inwardness. Genuine ability is in youth generally combined with a good memory. But empirical statements of this sort help little towards a knowledge of what memory intrinsically is. To comprehend the position and meaning of memory and to understand its organic interconnexion with thought is one of the hardest points, and hitherto one quite unregarded in the theory of mind. Memory *quâ* memory is itself the merely *external* mode, or merely *existential* aspect of thought, and thus needs a complementary element. The passage from it to thought is to our view and implicitly the identity of reason with this existential mode: an identity from which it follows that reason only exists in a subject, and as the function of that subject. Thus active reason is *Thinking*.

(γ) Thinking[144].

§ 465. Intelligence is recognitive: it cognises an intuition, but only because that intuition is already its own (§ 454); and in the name it re-discovers the fact (§ 462): but now it finds *its* universal in the double signification of the universal as such, and of the universal as immediate or as being, — finds i.e. the genuine universal which is its own unity overlapping and including its other, viz. being. Thus intelligence is explicitly, and on its own part cognitive: *virtually* it is the universal, — its product (the thought) is the thing: it is a plain identity of subjective and objective. It knows that what is *thought*, *is*, and that what *is*, only *is* in so far as it is a thought (§ 521); the thinking of intelligence is to *have thoughts*: these are as its content and object.

§ 466. But cognition by thought is still in the first instance formal: the universality and its being is the plain subjectivity of intelligence. The thoughts therefore are not yet fully and freely determinate, and the representations which have been inwardised to thoughts are so far still the given content.

§ 467. As dealing with this given content, thought is (α) *understanding* with its formal identity, working up the representations, that have been memorised, into species, genera, laws, forces, &c., in short into categories, — thus indicating that the raw material does not get the truth of its being save in these thought-forms. As intrinsically infinite negativity, thought is (β) essentially an act of partition, — *judgment*, which however does not break up the concept again into the old antithesis of universality and being, but distinguishes on the lines supplied by the interconnexions peculiar to the concept. Thirdly (γ), thought supersedes the formal distinction and institutes at the same time an identity of the differences, — thus being nominal *reason* or inferential understanding. Intelligence, as the act of thought, cognises. And (α) understanding out of its generalities (the categories) *explains* the individual, and is then said to comprehend or understand itself: (β) in the judgment it explains the individual to be an universal (species, genus). In these forms the *content* appears as given: (γ) but in inference (syllogism) it characterises a content from itself, by superseding that form-difference. With the perception of the necessity, the last immediacy still attaching to formal thought has vanished.

In *Logic* there was thought, but in its implicitness, and as reason develops itself in this distinction-lacking medium. So in *consciousness* thought occurs as a stage (§ 437 note). Here reason is as the truth of the antithetical distinction, as it had taken shape within the mind's own limits. Thought thus recurs again and again in these different parts of philosophy, because these parts are different only through the medium they are in and

the antithesis they imply; while thought is this one and the same centre, to which as to their truth the antithesis return.

§ 468. Intelligence which as theoretical appropriates an immediate mode of being, is, now that it has completed *taking possession*, in its own *property*: the last negation of immediacy has implicitly required that the intelligence shall itself determine its content. Thus thought, as free notion, is now also free in point of *content*. But when intelligence is aware that it is determinative of the content, which is *its* mode no less than it is a mode of being, it is Will.

(b) Mind Practical[145].

§ 469. As will, the mind is aware that it is the author of its own conclusions, the origin of its self-fulfilment. Thus fulfilled, this independency or individuality form the side of existence or of *reality* for the Idea of mind. As will, the mind steps into actuality; whereas as cognition it is on the soil of notional generality. Supplying its own content, the will is self-possessed, and in the widest sense free: this is its characteristic trait. Its finitude lies in the formalism that the spontaneity of its self-fulfilment means no more than a general and abstract ownness, not yet identified with matured reason. It is the function of the essential will to bring liberty to exist in the formal will, and it is therefore the aim of that formal will to fill itself with its essential nature, i.e. to make liberty its pervading character, content, and aim, as well as its sphere of existence. The essential freedom of will is, and must always be, a thought: hence the way by which will can make itself objective mind is to rise to be a thinking will, — to give itself the content which it can only have as it thinks itself.

True liberty, in the shape of moral life, consists in the will finding its purpose in a universal content, not in subjective or selfish interests. But

such a content is only possible in thought and through thought: it is nothing short of absurd to seek to banish thought from the moral, religious, and law-abiding life.

§ 470. Practical mind, considered at first as formal or immediate will, contains a double ought — (1) in the contrast which the new mode of being projected outward by the will offers to the immediate positivity of its old existence and condition, — an antagonism which in consciousness grows to correlation with external objects. (2) That first self-determination, being itself immediate, is not at once elevated into a thinking universality: the latter, therefore, virtually constitutes an obligation on the former in point of form, as it may also constitute it in point of matter; — a distinction which only exists for the observer.

(α) Practical Sense or Feeling[146].

§ 471. The autonomy of the practical mind at first is immediate and therefore formal, i.e. it *finds* itself as an *individuality* determined in *its* inward *nature*. It is thus "practical feeling," or instinct of action. In this phase, as it is at bottom a subjectivity simply identical with reason, it has no doubt a rational content, but a content which as it stands is individual, and for that reason also natural, contingent and subjective, — a content which may be determined quite as much by mere personalities of want and opinion, &c., and by the subjectivity which selfishly sets itself against the universal, as it may be virtually in conformity with reason.

An appeal is sometimes made to the sense (feeling) of right and morality, as well as of religion, which man is alleged to possess, — to his benevolent dispositions, — and even to his heart generally, — i.e. to the subject so far as the various practical feelings are in it all combined. So far as this appeal implies (1) that these ideas are immanent in his own self, and (2) that when feeling is opposed to the logical understanding, it, and not the partial

abstractions of the latter, *may* be the *totality* — the appeal has a legitimate meaning. But on the other hand feeling too *may* be onesided, unessential and bad. The rational, which exists in the shape of rationality when it is apprehended by thought, is the same content as the *good* practical feeling has, but presented in its universality and necessity, in its objectivity and truth.

Thus it is on the one hand *silly* to suppose that in the passage from feeling to law and duty there is any loss of import and excellence; it is this passage which lets feeling first reach its truth. It is equally silly to consider intellect as superfluous or even harmful to feeling, heart, and will; the truth and, what is the same thing, the actual rationality of the heart and will can only be at home in the universality of intellect, and not in the singleness of feeling as feeling. If feelings are of the right sort, it is because of their quality or content, — which is right only so far as it is intrinsically universal or has its source in the thinking mind. The difficulty for the logical intellect consists in throwing off the separation it has arbitrarily imposed between the several faculties of feeling and thinking mind, and coming to see that in the human being there is only *one* reason, in feeling, volition, and thought. Another difficulty connected with this is found in the fact that the Ideas which are the special property of the thinking mind, viz. God, law and morality, can also be *felt*. But feeling is only the form of the immediate and peculiar individuality of the subject, in which these facts, like any other objective facts (which consciousness also sets over against itself), may be placed.

On the other hand, it is *suspicious* or even worse to cling to feeling and heart in place of the intelligent rationality of law, right and duty; because all that the former holds more than the latter is only the particular subjectivity with its vanity and caprice. For the same reason it is out of place in a scientific treatment of the feelings to deal with anything beyond their form,

and to discuss their content; for the latter, when thought, is precisely what constitutes, in their universality and necessity, the rights and duties which are the true works of mental autonomy. So long as we study practical feelings and dispositions specially, we have only to deal with the selfish, bad, and evil; it is these alone which belong to the individuality which retains its opposition to the universal: their content is the reverse of rights and duties, and precisely in that way do they — but only in antithesis to the latter — retain a speciality of their own.

§ 472. The "Ought" of practical feeling is the claim of its essential autonomy to control some existing mode of fact — which is assumed to be worth nothing save as adapted to that claim. But as both, in their immediacy, lack objective determination, this relation of the *requirement* to existent fact is the utterly subjective and superficial feeling of pleasant or unpleasant.

Delight, joy, grief, &c., shame, repentance, contentment, &c., are partly only modifications of the formal "practical feeling" in *general*, but are partly different in the features that give the special tone and character mode to their "Ought."

The celebrated question as to the origin of evil in the world, so far at least as evil is understood to mean what is disagreeable and painful merely, arises on this stage of the formal practical feeling. Evil is nothing but the incompatibility between what is and what ought to be. "Ought" is an ambiguous term, — indeed infinitely so, considering that casual aims may also come under the form of Ought. But where the objects sought are thus casual, evil only executes what is rightfully due to the vanity and nullity of their planning: for they themselves were radically evil. The finitude of life and mind is seen in their judgment: the contrary which is separated from them they also have as a negative in them, and thus they are the contradiction called evil. In the dead there is neither evil nor pain: for in

inorganic nature the intelligible unity (concept) does not confront its existence and does not in the difference at the same time remain its permanent subject. Whereas in life, and still more in mind, we have this immanent distinction present: hence arises the Ought: and this negativity, subjectivity, ego, freedom are the principles of evil and pain. Jacob Böhme viewed egoity (selfhood) as pain and torment, and as the fountain of nature and of spirit.

(β) The Impulses and Choice[147].

§ 473. The practical ought is a "real" judgment. Will, which is essentially self-determination, finds in the conformity — as immediate and merely *found* to hand — of the existing mode to its requirement a negation, and something inappropriate to it. If the will is to satisfy itself, if the implicit unity of the universality and the special mode is to be realised, the conformity of its inner requirement and of the existent thing ought to be its act and institution. The will, as regards the form of its content, is at first still a natural will, directly identical with its specific mode: — natural *impulse* and *inclination*. Should, however, the totality of the practical spirit throw itself into a single one of the many restricted forms of impulse, each being always in conflict to another, it is *passion*.

§ 474. Inclinations and passions embody the same constituent features as the practical feeling. Thus, while on one hand they are based on the rational nature of the mind; they on the other, as part and parcel of the still subjective and single will, are infected with contingency, and appear as particular to stand to the individual and to each other in an external relation and with a necessity which creates bondage.

The special note in *passion* is its restriction to one special mode of volition, in which the whole subjectivity of the individual is merged, be the

value of that mode what it may. In consequence of this formalism, passion is neither good nor bad; the title only states that a subject has thrown his whole soul, — his interests of intellect, talent, character, enjoyment, — on one aim and object. Nothing great has been and nothing great can be accomplished without passion. It is only a dead, too often, indeed, a hypocritical moralising which inveighs against the form of passion as such.

But with regard to the inclinations, the question is directly raised, Which are good and bad? — Up to what degree the good continue good; — and (as there are many, each with its private range) In what way have they, being all in one subject and hardly all, as experience shows, admitting of gratification, to suffer at least reciprocal restriction? And, first of all, as regards the numbers of these impulses and propensities, the case is much the same as with the psychical powers, whose aggregate is to form the mind theoretical, — an aggregate which is now increased by the host of impulses. The nominal rationality of impulse and propensity lies merely in their general impulse not to be subjective merely, but to get realised, overcoming the subjectivity by the subject's own agency. Their genuine rationality cannot reveal its secret to a method of outer reflection which pre-supposes a number of *independent* innate tendencies and immediate instincts, and therefore is wanting in a single principle and final purpose for them. But the immanent "reflection" of mind itself carries it beyond their particularity and their natural immediacy, and gives their contents a rationality and objectivity, in which they exist as necessary ties of social relation, as rights and duties. It is this objectification which evinces their real value, their mutual connexions, and their truth. And thus it was a true perception when Plato (especially including as he did the mind's whole nature under its right) showed that the full reality of justice could be exhibited only in the *objective* phase of justice, viz. in the construction of the State as the ethical life.

The answer to the question, therefore, What are the good and rational propensities, and how they are to be co-ordinated with each other? resolves itself into an exposition of the laws and forms of common life produced by the mind when developing itself as *objective* mind — a development in which the *content* of autonomous action loses its contingency and optionality. The discussion of the true intrinsic worth of the impulses, inclinations, and passions is thus essentially the theory of legal, moral, and social *duties*.

§ 475. The subject is the act of satisfying impulses, an act of (at least) formal rationality, as it translates them from the subjectivity of content (which so far is *purpose*) into objectivity, where the subject is made to close with itself. If the content of the impulse is distinguished as the thing or business from this act of carrying it out, and we regard the thing which has been brought to pass as containing the element of subjective individuality and its action, this is what is called the *interest*. Nothing therefore is brought about without interest.

An action is an aim of the subject, and it is his agency too which executes this aim: unless the subject were in this way in the most disinterested action, i.e. unless he had an interest in it, there would be no action at all. — The impulses and inclinations are sometimes depreciated by being contrasted with the baseless chimera of a happiness, the free gift of nature, where wants are supposed to find their satisfaction without the agent doing anything to produce a conformity between immediate existence and his own inner requirements. They are sometimes contrasted, on the whole to their disadvantage, with the morality of duty for duty's sake. But impulse and passion are the very life-blood of all action: they are needed if the agent is really to be in his aim and the execution thereof. The morality concerns the content of the aim, which as such is the universal, an inactive thing, that finds its actualising in the agent; and finds it only when the aim

is immanent in the agent, is his interest and — should it claim to engross his whole efficient subjectivity — his passion.

§ 476. The will, as thinking and implicitly free, distinguishes itself from the particularity of the impulses, and places itself as simple subjectivity of thought above their diversified content. It is thus “reflecting” will.

§ 477. Such a particularity of impulse has thus ceased to be a mere datum: the reflective will now sees it as its own, because it closes with it and thus gives itself specific individuality and actuality. It is now on the standpoint of *choosing* between inclinations, and is option or *choice*.

§ 478. Will as choice claims to be free, reflected into itself as the negativity of its merely immediate autonomy. However, as the content, in which its former universality concludes itself to actuality, is nothing but the content of the impulses and appetites, it is actual only as a subjective and contingent will. It realises itself in a particularity, which it regards at the same time as a nullity, and finds a satisfaction in what it has at the same time emerged from. As thus contradictory, it is the process of distracting and suspending one desire or enjoyment by another, — and one satisfaction, which is just as much no satisfaction, by another, without end. But the truth of the particular satisfactions is the universal, which under the name of *happiness* the thinking will makes its aim.

(γ) Happiness[148].

§ 479. In this idea, which reflection and comparison have educed, of a universal satisfaction, the impulses, so far as their particularity goes, are reduced to a mere negative; and it is held that in part they are to be sacrificed to each other for the behoof that aim, partly sacrificed to that aim directly, either altogether or in part. Their mutual limitation, on one hand, proceeds from a mixture of qualitative and quantitative considerations: on the other hand, as happiness has its sole *affirmative* contents in the springs

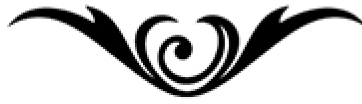
of action, it is on them that the decision turns, and it is the subjective feeling and good pleasure which must have the casting vote as to where happiness is to be placed.

§ 480. Happiness is the mere abstract and merely imagined universality of things desired, — a universality which only ought to be. But the particularity of the satisfaction which just as much *is* as it is abolished, and the abstract singleness, the option which gives or does not give itself (as it pleases) an aim in happiness, find their truth in the intrinsic *universality* of the will, i.e. its very autonomy or freedom. In this way choice is will only as pure subjectivity, which is pure and concrete at once, by having for its contents and aim only that infinite mode of being — freedom itself. In this truth of its autonomy, where concept and object are one, the will is an *actually free will*.

Free Mind[149].

§ 481. Actual free will is the unity of theoretical and practical mind: a free will, which realises its own freedom of will now that the formalism, fortuitousness, and contractedness of the practical content up to this point have been superseded. By superseding the adjustments of means therein contained, the will is the *immediate individuality* self-instituted, — an individuality, however, also purified of all that interferes with its universalism, i.e. with freedom itself. This universalism the will has as its object and aim, only so far as it thinks itself, knows this its concept, and is *will* as free *intelligence*.

§ 482. The mind which knows itself as free and wills itself as this its object, i.e. which has its true being for characteristic and aim, is in the first instance the rational will in general, or *implicit* Idea, and because implicit only the *notion* of absolute mind. As *abstract* Idea again, it is existent only



in the *immediate* will — it is the *existential* side of reason, — the *single* will as aware of this its universality constituting its contents and aim, and of which it is only the formal activity. If the will, therefore, in which the Idea thus appears is only finite, that will is also the act of developing the Idea, and of investing its self-unfolding content with an existence which, as realising the idea, is *actuality*. It is thus "Objective" Mind.

No Idea is so generally recognised as indefinite, ambiguous, and open to the greatest misconceptions (to which therefore it actually falls a victim) as the idea of Liberty: none in common currency with so little appreciation of its meaning. Remembering that free mind is *actual* mind, we can see how misconceptions about it are of tremendous consequence in practice. When individuals and nations have once got in their heads the abstract concept of full-blown liberty, there is nothing like it in its uncontrollable strength, just because it is the very essence of mind, and that as its very actuality. Whole continents, Africa and the East, have never had this idea, and are without it still. The Greeks and Romans, Plato and Aristotle, even the Stoics, did not have it. On the contrary, they saw that it is only by birth (as e.g. an Athenian or Spartan citizen), or by strength of character, education, or philosophy (— the sage is free even as a slave and in chains) that the human being is actually free. It was through Christianity that this idea came into the world. According to Christianity, the individual *as such* has an infinite value as the object and aim of divine love, destined as mind to live in absolute relationship with God himself, and have God's mind dwelling in him: i.e. man is implicitly destined to supreme freedom. If, in religion as such, man is aware of this relationship to the absolute mind as his true being, he has also, even when he steps into the sphere of secular existence, the divine mind present with him, as the substance of the state of the family, &c. These institutions are due to the guidance of that spirit, and are constituted after its measure; whilst by their existence the moral temper comes to be

indwelling in the individual, so that in this sphere of particular existence, of present sensation and volition, he is *actually* free.

If to be aware of the idea — to be aware, i.e. that men are aware of freedom as their essence, aim, and object — is matter of *speculation*, still this very idea itself is the actuality of men — not something which they *have*, as men, but which they *are*. Christianity in its adherents has realised an ever-present sense that they are not and cannot be slaves; if they are made slaves, if the decision as regards their property rests with an arbitrary will, not with laws or courts of justice, they would find the very substance of their life outraged. This will to liberty is no longer an *impulse* which demands its satisfaction, but the permanent character — the spiritual consciousness grown into a non-impulsive nature. But this freedom, which the content and aim of freedom has, is itself only a notion — a principle of the mind and heart, intended to develope into an objective phase, into legal, moral, religious, and not less into scientific actuality.

Section II. Mind Objective.

§ 483. THE objective Mind is the absolute Idea, but only existing *in posse*: and as it is thus on the territory of finitude, its actual rationality retains the aspect of external apparency. The free will finds itself immediately confronted by differences which arise from the circumstance that freedom is its *inward* function and aim, and is in relation to an external and already subsisting objectivity, which splits up into different heads: viz. anthropological data (i.e. private and personal needs), external things of nature which exist for consciousness, and the ties of relation between individual wills which are conscious of their own diversity and particularity. These aspects constitute the external material for the embodiment of the will.

§ 484. But the purposive action of this will is to realise its concept, Liberty, in these externally-objective aspects, making the latter a world moulded by the former, which in it is thus at home with itself, locked together with it: the concept accordingly perfected to the Idea. Liberty, shaped into the actuality of a world, receives the *form of Necessity* the deeper substantial nexus of which is the system or organisation of the principles of liberty, whilst its phenomenal nexus is power or authority, and the sentiment of obedience awakened in consciousness.

§ 485. This unity of the rational will with the single will (this being the peculiar and immediate medium in which the former is actualised) constitutes the simple actuality of liberty. As it (and its content) belongs to thought, and is the virtual *universal*, the content has its right and true character only in the form of universality. When invested with this character for the intelligent consciousness, or instituted as an authoritative power, it is

a *Law*[150]. When, on the other hand, the content is freed from the mixedness and fortuitousness, attaching to it in the practical feeling and in impulse, and is set and grafted in the individual will, not in the form of impulse, but in its universality, so as to become its habit, temper and character, it exists as manner and custom, or *Usage*[151].

§ 486. This "reality," in general, where free will has *existence*, is the *Law* (Right), — the term being taken in a comprehensive sense not merely as the limited juristic law, but as the actual body of all the conditions of freedom. These conditions, in relation to the *subjective* will, where they, being universal, ought to have and can only have their existence, are its *Duties*; whereas as its temper and habit they are *Manners*. What is a right is also a duty, and what is a duty, is also a right. For a mode of existence is a right, only as a consequence of the free substantial will: and the same content of fact, when referred to the will distinguished as subjective and individual, is a duty. It is the same content which the subjective consciousness recognises as a duty, and brings into existence in these several wills. The finitude of the objective will thus creates the semblance of a distinction between rights and duties.

In the phenomenal range right and duty are *correlata*, at least in the sense that to a right on my part corresponds a duty in some one else. But, in the light of the concept, my right to a thing is not merely possession, but as possession by a *person* it is *property*, or legal possession, and it is a *duty* to possess things as *property*, i.e. to be as a person. Translated into the phenomenal relationship, viz. relation to another person — this grows into the duty of some one *else* to respect *my* right. In the morality of the conscience, duty in general is in me — a free subject — at the same time a right of my subjective will or disposition. But in this individualist moral sphere, there arises the division between what is only inward purpose

(disposition or intention), which only has its being in me and is merely subjective duty, and the actualisation of that purpose: and with this division a contingency and imperfection which makes the inadequacy of mere individualistic morality. In social ethics these two parts have reached their truth, their absolute unity; although even right and duty return to one another and combine by means of certain adjustments and under the guise of necessity. The rights of the father of the family over its members are equally duties towards them; just as the children's duty of obedience is their right to be educated to the liberty of manhood. The penal judicature of a government, its rights of administration, &c., are no less its duties to punish, to administer, &c.; as the services of the members of the State in dues, military services, &c., are duties and yet their right to the protection of their private property and of the general substantial life in which they have their root. All the aims of society and the State are the private aim of the individuals. But the set of adjustments, by which their duties come back to them as the exercise and enjoyment of right, produces an appearance of diversity: and this diversity is increased by the variety of shapes which value assumes in the course of exchange, though it remains intrinsically the same. Still it holds fundamentally good that he who has no rights has no duties and *vice versa*.

Distribution.

§ 487. The free will is

A. itself at first immediate, and hence as a single being — the *person*: the existence which the person gives to its liberty is *property*. The *Right as* right (law) is *formal, abstract right*.

B. When the will is reflected into self, so as to have its existence inside it, and to be thus at the same time characterised as a *particular*, it is the right of the *subjective* will, *morality* of the individual conscience.

C. When the free will is the substantial will, made actual in the subject and conformable to its concept and rendered a totality of necessity, — it is the ethics of actual life in family, civil society, and state.

Sub-Section A. Law.[152]

(a) Property.

§ 488. MIND, in the immediacy of its self-secured liberty, is an individual, but one that knows its individuality as an absolutely free will: it is a *person*, in whom the inward sense of this freedom, as in itself still abstract and empty, has its particularity and fulfilment not yet on its own part, but on an external *thing*. This thing, as something devoid of will, has no rights against the subjectivity of intelligence and volition, and is by that subjectivity made adjectival to it, the external sphere of its liberty; — *possession*.

§ 489. By the judgment of possession, at first in the outward appropriation, the thing acquires the predicate of "mine." But this predicate, on its own account merely "practical," has here the signification that I import my personal will into the thing. As so characterised, possession is *property*, which as possession is a *means*, but as existence of the personality is an *end*.

§ 490. In his property the person is brought into union with itself. But the thing is an abstractly external thing, and the I in it is abstractly external. The concrete return of me into me in the externality is that I, the infinite self-relation, am as a person the repulsion of me from myself, and have the existence of my personality in the *being of other persons*, in my relation to them and in my recognition by them, which is thus mutual.

§ 491. The thing is the *mean* by which the extremes meet in one. These extremes are the persons who, in the knowledge of their identity as free, are simultaneously mutually independent. For them my will has its *definite*

recognisable existence in the thing by the immediate bodily act of taking possession, or by the formation of the thing or, it may be, by mere designation of it.

§ 492. The casual aspect of property is that I place my will in *this* thing: so far my will is *arbitrary*, I can just as well put it in it as not, — just as well withdraw it as not. But so far as my will lies in a thing, it is only I who can withdraw it: it is only with my will that the thing can pass to another, whose property it similarly becomes only with his will: — *Contract*.

(b) Contract.

§ 493. The two wills and their agreement in the contract are as an *internal* state of mind different from its realisation in the *performance*. The comparatively "ideal" utterance (of contract) in the *stipulation* contains the actual surrender of a property by the one, its changing hands, and its acceptance by the other will. The contract is thus thoroughly binding: it does not need the performance of the one or the other to become so — otherwise we should have an infinite regress or infinite division of thing, labour, and time. The utterance in the stipulation is complete and exhaustive. The inwardness of the will which surrenders and the will which accepts the property is in the realm of ideation, and in that realm the word is deed and thing (§ 462) — the full and complete deed, since here the conscientiousness of the will does not come under consideration (as to whether the thing is meant in earnest or is a deception), and the will refers only to the external thing.

§ 494. Thus in the stipulation we have the *substantial* being of the contract standing out in distinction from its real utterance in the performance, which is brought down to a mere sequel. In this way there is put into the thing or performance a distinction between its immediate specific *quality* and its substantial being or *value*, meaning by value the

quantitative terms into which that qualitative feature has been translated. One piece of property is thus made comparable with another, and may be made equivalent to a thing which is (in quality) wholly heterogeneous. It is thus treated in general as an abstract, universal thing or commodity.

§ 495. The contract, as an agreement which has a voluntary origin and deals with a casual commodity, involves at the same time the giving to this "accidental" will a positive fixity. This will may just as well not be conformable to law (right), and, in that case, produces a *wrong*: by which however the absolute law (right) is not superseded, but only a relationship originated of right to wrong.

(c) Right versus Wrong.

§ 496. Law (right) considered as the realisation of liberty in externals, breaks up into a multiplicity of relations to this external sphere and to other persons (§§ 491, 493 seqq.). In this way there are (1) several titles or grounds at law, of which (seeing that property both on the personal and the real side is exclusively individual) only one is the right, but which, because they face each other, each and all are invested with a *show* of right, against which the former is defined as the intrinsically right.

§ 497. Now so long as (compared against this show) the one intrinsically right, still presumed identical with the several titles, is affirmed, willed, and recognised, the only diversity lies in this, that the special thing is subsumed under the one law or right by the *particular* will of *these* several persons. This is naïve, non-malicious wrong. Such wrong in the several claimants is a simple *negative judgment*, expressing the *civil suit*. To settle it there is required a third judgment, which, as the judgment of the intrinsically right, is disinterested, and a power of giving the one right existence as against that semblance.

§ 498. But (2) if the semblance of right is willed as such *against* right intrinsical by the particular will, which thus becomes *wicked*, then the external *recognition* of right is separated from the right's true value; and while the former only is respected, the latter is violated. This gives the wrong of *fraud* — the infinite judgment as identical (§ 173), — where the nominal relation is retained, but the sterling value is let slip.

§ 499. (3) Finally, the particular will sets itself in opposition to the intrinsic right by negating that right itself as well as its recognition or semblance. [Here there is a negatively infinite judgment (§ 173) in which there is denied the class as a whole, and not merely the particular mode — in this case the apparent recognition] Thus the will is violently wicked, and commits a *crime*.

§ 500. As an outrage on right, such an action is essentially and actually null. In it the agent, as a volitional and intelligent being, sets up a law — a law however which is nominal and recognised by him only — a universal which holds good *for him*, and under which he has at the same time subsumed himself by his action. To display the nullity of such an act, to carry out simultaneously this nominal law and the intrinsic right, in the first instance by means of a subjective individual will, is the work of *Revenge*. But, revenge, starting from the interest of an immediate particular personality, is at the same time only a new outrage; and so on without end. This progression, like the last, abolishes itself in a third judgment, which is disinterested — *punishment*.

§ 501. The instrumentality by which authority is given to intrinsic right is (α) that a particular will, that of the judge, being conformable to the right, has an interest to turn against the crime (— which in the first instance, in revenge, is a matter of chance), and (β) that an executive power (also in the first instance casual) negates the negation of right that was created by the criminal. This negation of right has its existence in the will of the criminal;

and consequently revenge or punishment directs itself against the person or property of the criminal and exercises *coercion* upon him. It is in this legal sphere that coercion in general has possible scope, — compulsion against the thing, in seizing and maintaining it against another's seizure: for in this sphere the will has its existence immediately in externals as such, or in corporeity, and can be seized only in this quarter. But more than *possible* compulsion is not, so long as I can withdraw myself as free from every mode of existence, even from the range of all existence, i.e. from life. It is legal only as abolishing a first and original compulsion.

§ 502. A distinction has thus emerged between the law (right) and the subjective will. The "reality" of right, which the personal will in the first instance gives itself in immediate wise, is seen to be due to the instrumentality of the subjective will, — whose influence as on one hand it gives existence to the essential right, so may on the other cut itself off from and oppose itself to it. Conversely, the claim of the subjective will to be in this abstraction a power over the law of right is null and empty of itself: it gets truth and reality essentially only so far as that will in itself realises the reasonable will. As such it is *morality*[153] proper.

The phrase "Law of Nature," or Natural Right[154], in use for the philosophy of law involves the ambiguity that it may mean either right as something existing ready-formed in nature, or right as governed by the nature of things, i.e. by the notion. The former used to be the common meaning, accompanied with the fiction of a *state of nature*, in which the law of nature should hold sway; whereas the social and political state rather required and implied a restriction of liberty and a sacrifice of natural rights. The real fact is that the whole law and its every article are based on free personality alone, — on self-determination or autonomy, which is the very contrary of determination by nature. The law of nature — strictly so called — is for that reason the predominance of the strong and the reign of force,

and a state of nature a state of violence and wrong, of which nothing truer can be said than that one ought to depart from it. The social state, on the other hand, is the condition in which alone right has its actuality: what is to be restricted and sacrificed is just the wilfulness and violence of the state of nature.

Sub-Section B. The Morality Of Conscience[155].

§ 503. THE free individual, who, in mere law, counts only as a *person*, is now characterised as a *subject*, a will reflected into itself so that, be its affection what it may, it is distinguished (as existing in it) as *its own* from the existence of freedom in an external thing. Because the affection of the will is thus inwardised, the will is at the same time made a particular, and there arise further particularisations of it and relations of these to one another. This affection is partly the essential and implicit will, the reason of the will, the essential basis of law and moral life: partly it is the existent volition, which is before us and throws itself into actual deeds, and thus comes into relationship with the former. The subjective will is *morally* free, so far as these features are its inward institution, its own, and willed by it. Its utterance in deed with this freedom is an *action*, in the externality of which it only admits as its own, and allows to be imputed to it, so much as it has consciously willed.

This subjective or "moral" freedom is what a European especially calls freedom. In virtue of the right thereto a man must possess a personal knowledge of the distinction between good and evil in general: ethical and religious principles shall not merely lay their claim on him as external laws and precepts of authority to be obeyed, but have their assent, recognition, or even justification in his heart, sentiment, conscience, intelligence, &c. The subjectivity of the will in itself is its supreme aim and absolutely essential to it.

The "moral" must be taken in the wider sense in which it does not signify the morally good merely. In French *le moral* is opposed to *le physique*, and means the mental or intellectual in general. But here the

moral signifies volitional mode, so far as it is in the interior of the will in general; it thus includes purpose and intention, — and also moral wickedness.

a. Purpose[156].

§ 504. So far as the action comes into immediate touch with *existence*, *my part* in it is to this extent formal, that external existence is also *independent* of the agent. This externality can pervert his action and bring to light something else than lay in it. Now, though any alteration as such, which is set on foot by the subject's action, is its *deed*[157], still the subject does not for that reason recognise it as its *action*[158], but only admits as its own that existence in the deed which lay in its knowledge and will, which was its *purpose*. Only for that does it hold itself *responsible*.

b. Intention and Welfare[159].

§ 505. As regards its empirically concrete *content* (1) the action has a variety of particular aspects and connexions. In point of *form*, the agent must have known and willed the action in its essential feature, embracing these individual points. This is the right of *intention*. While *purpose* affects only the immediate fact of existence, *intention* regards the underlying essence and aim thereof. (2) The agent has no less the right to see that the particularity of content in the action, in point of its matter, is not something external to him, but is a particularity of his own, — that it contains his needs, interests, and aims. These aims, when similarly comprehended in a single aim, as in happiness (§ 479), constitute his *well-being*. This is the right to well-being. Happiness (good fortune) is distinguished from well-being only in this, that happiness implies no more than some sort of immediate existence, whereas well-being regards it as also justified as regards morality.

§ 506. But the essentiality of the intention is in the first instance the abstract form of generality. Reflection can put in this form this and that particular aspect in the empirically-concrete action, thus making it essential to the intention or restricting the intention to it. In this way the supposed essentiality of the intention and the real essentiality of the action may be brought into the greatest contradiction — e.g. a good intention in case of a crime. Similarly well-being is abstract and may be set on this or that: as appertaining to this single agent, it is always something particular.

c. Goodness and Wickedness[160].

§ 507. The truth of these particularities and the concrete unity of their formalism is the content of the universal, essential and actual, will, — the law and underlying essence of every phase of volition, the essential and actual good. It is thus the absolute final aim of the world, and *duty* for the agent who *ought* to have *insight* into the *good*, make it his *intention* and bring it about by his activity.

§ 508. But though the good is the universal of will — a universal determined in itself, — and thus including in it particularity, — still so far as this particularity is in the first instance still abstract, there is no principle at hand to determine it. Such determination therefore starts up also outside that universal; and as heteronomy or determinance of a will which is free and has rights of its own, there awakes here the deepest contradiction. (α) In consequence of the indeterminate determinism of the good, there are always *several sorts* of good and *many kinds of duties*, the variety of which is a dialectic of one against another and brings them into *collision*. At the same time because good is one, they *ought* to stand in harmony; and yet each of them, though it is a particular duty, is as good and as duty absolute. It falls upon the agent to be the dialectic which, superseding this absolute claim of each, concludes such a combination of them as excludes the rest.

§ 509. (β) To the agent, who in his existent sphere of liberty is essentially as a *particular*, his *interest and welfare* must, on account of that existent sphere of liberty, be essentially an aim and therefore a duty. But at the same time in aiming at the good, which is the not-particular but only universal of the will, the particular interest *ought not* to be a constituent motive. On account of this independency of the two principles of action, it is likewise an accident whether they harmonise. And yet they *ought* to harmonise, because the agent, as individual and universal, is always fundamentally one identity.

(γ) But the agent is not only a mere particular in his existence; it is also a form of his existence to be an abstract self-certainty, an abstract reflection of freedom into himself. He is thus distinct from the reason in the will, and capable of making the universal itself a particular and in that way a semblance. The good is thus reduced to the level of a mere "may happen" for the agent, who can therefore resolve itself to somewhat opposite to the good, can be wicked.

§ 510. (δ) The external objectivity, following the distinction which has arisen in the subjective will (§ 503), constitutes a peculiar world of its own, — another extreme which stands in no rapport with the internal will-determination. It is thus a matter of chance, whether it harmonises with the subjective aims, whether the good is realised, and the wicked, an aim essentially and actually null, nullified in it: it is no less matter of chance whether the agent finds in it his well-being, and more precisely whether in the world the good agent is happy and the wicked unhappy. But at the same time the world *ought* to allow the good action, the essential thing, to be carried out in it; it *ought* to grant the good agent the satisfaction of his particular interest, and refuse it to the wicked; just as it *ought* also to make the wicked itself null and void.

§ 511. The all-round contradiction, expressed by this repeated *ought*, with its absoluteness which yet at the same time is *not* — contains the most abstract 'analysis' of the mind in itself, its deepest descent into itself. The only relation the self-contradictory principles have to one another is in the abstract certainty of self; and for this infinitude of subjectivity the universal will, good, right, and duty, no more exist than not. The subjectivity alone is aware of itself as choosing and deciding. This pure self-certitude, rising to its pitch, appears in the two directly inter-changing forms — of *Conscience* and *Wickedness*. The former is the will of goodness; but a goodness which to this pure subjectivity is the *non-objective*, non-universal, the unutterable; and over which the agent is conscious that *he* in his *individuality* has the decision. Wickedness is the same awareness that the single self possesses the decision, so far as the single self does not merely remain in this abstraction, but takes up the content of a subjective interest contrary to the good.

§ 512. This supreme pitch of the "*phenomenon*" of will, — sublimating itself to this absolute vanity — to a goodness, which has no objectivity, but is only sure of itself, and a self-assurance which involves the nullification of the universal — collapses by its own force. Wickedness, as the most intimate reflection of subjectivity itself, in opposition to the objective and universal, (which it treats as mere sham,) is the same as the good sentiment of abstract goodness, which reserves to the subjectivity the determination thereof: — the utterly abstract semblance, the bare perversion and annihilation of itself. The result, the truth of this semblance, is, on its negative side, the absolute nullity of this volition which would fain hold its own against the good, and of the good, which would only be abstract. On the affirmative side, in the notion, this semblance thus collapsing is the same simple universality of the will, which is the good. The subjectivity, in this its *identity* with the good, is only the infinite form, which actualises and

developes it. In this way the standpoint of bare reciprocity between two independent sides, — the standpoint of the *ought*, is abandoned, and we have passed into the field of ethical life.

Sub-Section C. The Moral Life, Or Social Ethics[161].

§ 513. THE moral life is the perfection of spirit objective — the truth of the subjective and objective spirit itself. The failure of the latter consists — partly in having its freedom *immediately* in reality, in something external therefore, in a thing, — partly in the abstract universality of its goodness. The failure of spirit subjective similarly consists in this, that it is, as against the universal, abstractly self-determinant in its inward individuality. When these two imperfections are suppressed, subjective *freedom* exists as the covertly and overtly *universal* rational will, which is sensible of itself and actively disposed in the consciousness of the individual subject, whilst its practical operation and immediate universal *actuality* at the same time exist as moral usage, manner and custom, — where self-conscious *liberty* has become *nature*.

§ 514. The consciously free substance, in which the absolute "ought" is no less an "is," has actuality as the spirit of a nation. The abstract disruption of this spirit singles it out into *persons*, whose independence it however controls and entirely dominates from within. But the person, as an intelligent being, feels that underlying essence to be his own very being — ceases when so minded to be a mere accident of it — looks upon it as his absolute final aim. In its actuality he sees not less an achieved present, than somewhat he brings it about by his action, — yet somewhat which without all question *is*. Thus, without any selective reflection, the person performs its duty as *his own* and as something which *is*; and in this necessity *he* has himself and his actual freedom.

§ 515. Because the substance is the absolute unity of individuality and universality of freedom, it follows that the actuality and action of each

individual to keep and to take care of his own being, while it is on one hand conditioned by the pre-supposed total in whose complex alone he exists, is on the other a transition into a universal product. — The social disposition of the individuals is their sense of the substance, and of the identity of all their interests with the total; and that the other individuals mutually know each other and are actual only in this identity, is confidence (trust) — the genuine ethical temper.

§ 516. The relations between individuals in the several situations to which the substance is particularised form their *ethical duties*. The ethical personality, i.e. the subjectivity which is permeated by the substantial life, is *virtue*. In relation to the bare facts of external being, to *destiny*, virtue does not treat them as a mere negation, and is thus a quiet repose in itself: in relation to substantial objectivity, to the total of ethical actuality, it exists as confidence, as deliberate work for the community, and the capacity of sacrificing self thereto; whilst in relation to the incidental relations of social circumstance, it is in the first instance justice and then benevolence. In the latter sphere, and in its attitude to its own visible being and corporeity, the individuality expresses its special character, temperament, &c. as personal *virtues*.

§ 517. The ethical substance is

AA. as “immediate” or *natural* mind, — the *Family*.

BB. The “relative” totality of the “relative” relations of the individuals as independent persons to one another in a formal universality — *Civil Society*.

CC. The self-conscious substance, as the mind developed to an organic actuality — the *Political Constitution*.

AA. The Family.

§ 518. The ethical spirit, in its *immediacy*, contains the *natural* factor that the individual has its substantial existence in its natural universal, i.e. in its kind. This is the sexual tie, elevated however to a spiritual significance, — the unanimity of love and the temper of trust. In the shape of the family, mind appears as feeling.

§ 519. (1) The physical difference of sex thus appears at the same time as a difference of intellectual and moral type. With their exclusive individualities these personalities combine to form a *single person*: the subjective union of hearts, becoming a "substantial" unity, makes this union an ethical tie — *Marriage*. The 'substantial' union of hearts makes marriage an indivisible personal bond — monogamic marriage: the bodily conjunction is a sequel to the moral attachment. A further sequel is community of personal and private interests.

§ 520. (2) By the community in which the various members constituting the family stand in reference to property, that property of the one person (representing the family) acquires an ethical interest, as do also its industry, labour, and care for the future.

§ 521. The ethical principle which is conjoined with the natural generation of the children, and which was assumed to have primary importance in first forming the marriage union, is actually realised in the second or spiritual birth of the children, — in educating them to independent personality.

§ 522. (3) The children, thus invested with independence, leave the concrete life and action of the family to which they primarily belong, acquire an existence of their own, destined however to found anew such an actual family. Marriage is of course broken up by the *natural* element contained in it, the death of husband and wife: but even their union of hearts, as it is a mere "substantiality" of feeling, contains the germ of liability to chance and decay. In virtue of such fortuitousness, the members

of the family take up to each other the status of persons; and it is thus that the family finds introduced into it for the first time the element, originally foreign to it, of *legal* regulation.

BB. Civil Society[162].

§ 523. As the substance, being an intelligent substance, particularises itself abstractly into many persons (the family is only a single person), into families or individuals, who exist independent and free, as private persons, it loses its ethical character: for these persons as such have in their consciousness and as their aim not the absolute unity, but their own petty selves and particular interests. Thus arises the system of *atomistic*: by which the substance is reduced to a general system of adjustments to connect self-subsisting extremes and their particular interests. The developed totality of this connective system is the state as civil society, or *state external*.

a. The System of Wants[163].

§ 524. (α) The particularity of the persons includes in the first instance their wants. The possibility of satisfying these wants is here laid on the social fabric, the general stock from which all derive their satisfaction. In the condition of things in which this method of satisfaction by indirect adjustment is realised, immediate seizure (§ 488) of external objects as means thereto exists barely or not at all: the objects are already property. To acquire them is only possible by the intervention, on one hand, of the possessors' will, which as particular has in view the satisfaction of their variously defined interests; while on the other hand it is conditioned by the ever continued production of fresh means of exchange by the exchangers' *own labour*. This instrument, by which the labour of all facilitates satisfaction of wants, constitutes the general stock.

§ 525. (β) The glimmer of universal principle in this particularity of wants is found in the way intellect creates differences in them, and thus causes an indefinite multiplication both of wants and of means for their different phases. Both are thus rendered more and more abstract. This “morcellement” of their content by abstraction gives rise to the *division of labour*. The habit of this abstraction in enjoyment, information, feeling and demeanour, constitutes training in this sphere, or nominal culture in general.

§ 526. The labour which thus becomes more abstract tends on one hand by its uniformity to make labour easier and to increase production, — on another to limit each person to a single kind of technical skill, and thus produce more unconditional dependence on the social system. The skill itself becomes in this way mechanical, and gets the capability of letting the machine take the place of human labour.

§ 527. (γ) But the concrete division of the general stock — which is also a general business (of the whole society) — into particular masses determined by the factors of the notion, — masses each of which possesses its own basis of subsistence, and a corresponding mode of labour, of needs, and of means for satisfying them, besides of aims and interests, as well as of mental culture and habit — constitutes the difference of Estates (orders or ranks). Individuals apportion themselves to these according to natural talent, skill, option and accident. As belonging to such a definite and stable sphere, they have their actual existence, which as existence is essentially a particular; and in it they have their social morality, which is *honesty*, their recognition and their *honour*.

Where civil society, and with it the State, exists, there arise the several estates in their difference: for the universal substance, as vital, *exists* only so far as it organically *particularises* itself. The history of constitutions is the history of the growth of these estates, of the legal relationships of individuals to them, and of these estates to one another and to their centre.

§ 528. To the “substantial,” natural estate the fruitful soil and ground supply a natural and stable capital; its action gets direction and content through natural features, and its moral life is founded on faith and trust. The second, the “reflected” estate has as its allotment the social capital, the medium created by the action of middlemen, of mere agents, and an ensemble of contingencies, where the individual has to depend on his subjective skill, talent, intelligence and industry. The third, “thinking” estate has for its business the general interests; like the second it has a subsistence procured by means of its own skill, and like the first a certain subsistence, certain however because guaranteed through the whole society.

b. Administration of Justice[164].

§ 529. When matured through the operation of natural need and free option into a system of universal relationships and a regular course of external necessity, the principle of casual particularity gets that stable articulation which liberty requires in the shape of *formal right*. (1) The actualisation which right gets in this sphere of mere practical intelligence is that it be brought to consciousness as the stable universal, that it be known and stated in its specificality with the voice of authority — the *Law*[165].

The *positive* element in laws concerns only their form of *publicity* and *authority* — which makes it possible for them to be known by all in a customary and external way. Their content *per se* may be reasonable — or it may be unreasonable and so wrong. But when right, in the course of definite manifestation, is developed in detail, and its content analyses itself to gain definiteness, this analysis, because of the finitude of its materials, falls into the falsely infinite progress: the *final* definiteness, which is absolutely essential and causes a break in this progress of unreality, can in this sphere of finitude be attained only in a way that savours of contingency

and arbitrariness. Thus whether three years, ten thalers, or only 2-1/2, 2-3/4, 2-4/5 years, and so on *ad infinitum*, be the right and just thing, can by no means be decided on intelligible principles, — and yet it should be decided. Hence, though of course only at the final points of deciding, on the side of external existence, the "positive" principle naturally enters law as contingency and arbitrariness. This happens and has from of old happened in all legislations: the only thing wanted is clearly to be aware of it, and not be misled by the talk and the pretence as if the ideal of law were, or could be, to be, at *every* point, determined through reason or legal intelligence, on purely reasonable and intelligent grounds. It is a futile perfectionism to have such expectations and to make such requirements in the sphere of the finite.

There are some who look upon laws as an evil and a profanity, and who regard governing and being governed from natural love, hereditary, divinity or nobility, by faith and trust, as the genuine order of life, while the reign of law is held an order of corruption and injustice. These people forget that the stars — and the cattle too — are governed and well governed too by laws; — laws however which are only internally in these objects, not *for them*, not as laws *set to* them: — whereas it is man's privilege to *know* his law. They forget therefore that he can truly obey only such known law, — even as his law can only be a just law, as it is a *known* law; — though in other respects it must be in its essential content contingency and caprice, or at least be mixed and polluted with such elements.

The same empty requirement of perfection is employed for an opposite thesis — viz. to support the opinion that a code is impossible or impracticable. In this case there comes in the additional absurdity of putting essential and universal provisions in one class with the particular detail. The finite material is definable on and on to the false infinite: but this advance is not, as in the mental images of space, a generation of new spatial characteristics of the same quality as those preceding them, but an advance

into greater and ever greater speciality by the acumen of the analytic intellect, which discovers new distinctions, which again make new decisions necessary. To provisions of this sort one may give the name of *new* decisions or *new* laws; but in proportion to the gradual advance in specialisation the interest and value of these provisions declines. They fall within the already subsisting "substantial," general laws, like improvements on a floor or a door, within the house — which though something *new*, are not a new *house*. But there is a contrary case. If the legislation of a rude age began with single provisos, which go on by their very nature always increasing their number, there arises, with the advance in multitude, the need of a simpler code, — the need i.e. of embracing that lot of singulars in their general features. To find and be able to express these principles well beseems an intelligent and civilised nation. Such a gathering up of single rules into general forms, first really deserving the name of laws, has lately been begun in some directions by the English Minister Peel, who has by so doing gained the gratitude, even the admiration, of his countrymen.

§ 530. (2) The positive form of Laws — to be *promulgated and made known* as laws — is a condition of the *external obligation* to obey them; inasmuch as, being laws of strict right, they touch only the abstract will, — itself at bottom external — not the moral or ethical will. The subjectivity to which the will has in this direction a right is here only publicity. This subjective existence is as existence of the essential and developed truth in this sphere of Right at the same time an externally objective existence, as universal authority and necessity.

The legality of property and of private transactions concerned therewith — in consideration of the principle that all law must be promulgated, recognised, and thus become authoritative — gets its universal guarantee through *formalities*.

§ 531. (3) Legal forms get the necessity, to which objective existence determines itself, in the *judicial system*. Abstract right has to exhibit itself to the *court* — to the individualised right — as *proven*: — a process in which there may be a difference between what is abstractly right and what is provably right. The court takes cognisance and action in the interest of right as such, deprives the existence of right of its contingency, and in particular transforms this existence, — as this exists as revenge — into *punishment* (§ 500).

The comparison of the two species, or rather two elements in the judicial conviction, bearing on the actual state of the case in relation to the accused, — (1) according as that conviction is based on mere circumstances and other people's witness alone, — or (2) in addition requires the confession of the accused, constitutes the main point in the question of the so-called jury-courts. It is an essential point that the two ingredients of a judicial cognisance, the judgment as to the state of the fact, and the judgment as application of the law to it, should, as at bottom different sides, be exercised as *different functions*. By the said institution they are allotted even to bodies differently qualified, — from the one of which individuals belonging to the official judiciary are expressly excluded. To carry this separation of functions up to this separation in the courts rests rather on extra-essential considerations: the main point remains only the separate performance of these essentially different functions. — It is a more important point whether the confession of the accused is or is not to be made a condition of penal judgment. The institution of the jury-court loses sight of this condition. The point is that on this ground certainty is completely inseparable from truth: but the confession is to be regarded as the very acmé of certainty-giving which in its nature is subjective. The final decision therefore lies with the confession. To this therefore the accused has an absolute right, if the proof is to be made final and the judges to be convinced. No doubt this factor is

incomplete, because it is only one factor; but still more incomplete is the other when no less abstractly taken, — viz. mere circumstantial evidence. The jurors are essentially judges and pronounce a judgment. In so far, then, as all they have to go on are such objective proofs, whilst at the same time their defect of certainty (incomplete in so far as it is only *in them*) is admitted, the jury-court shows traces of its barbaric origin in a confusion and admixture between objective proofs and subjective or so-called "moral" conviction. — It is easy to call *extraordinary* punishments an absurdity; but the fault lies rather with the shallowness which takes offence at a mere name. Materially the principle involves the difference of objective probation according as it goes with or without the factor of absolute certification which lies in confession.

§ 532. The function of judicial administration is only to actualise to necessity the abstract side of personal liberty in civil society. But this actualisation rests at first on the particular subjectivity of the judge, since here as yet there is not found the necessary unity of it with right in the abstract. Conversely, the blind necessity of the system of wants is not lifted up into the consciousness of the universal, and worked from that period of view.

c. Police and Corporation[166].

§ 533. Judicial administration naturally has no concern with such part of actions and interests as belongs only to particularity, and leaves to chance not only the occurrence of crimes but also the care for public weal. In civil society the sole end is to satisfy want — and that, because it is man's want, in a uniform general way, so as to *secure* this satisfaction. But the machinery of social necessity leaves in many ways a casualness about this satisfaction. This is due to the variability of the wants themselves, in which opinion and subjective good-pleasure play a great part. It results also from

circumstances of locality, from the connexions between nation and nation, from errors and deceptions which can be foisted upon single members of the social circulation and are capable of creating disorder in it, — as also and especially from the unequal capacity of individuals to take advantage of that general stock. The onward march of this necessity also sacrifices the very particularities by which it is brought about, and does not itself contain the affirmative aim of securing the satisfaction of individuals. So far as concerns them, it *may* be far from beneficial: yet here the individuals are the morally-justifiable end.

§ 534. To keep in view this general end, to ascertain the way in which the powers composing that social necessity act, and their variable ingredients, and to maintain that end in them and against them, is the work of an institution which assumes on *one* hand, to the concrete of civil society, the position of an external universality. Such an order acts with the power of an external state, which, in so far as it is rooted in the higher or substantial state, appears as state "police." On the *other* hand, in this sphere of particularity the only recognition of the aim of substantial universality and the only carrying of it out is restricted to the business of particular branches and interests. Thus we have the *corporation*, in which the particular citizen in his private capacity finds the securing of his stock, whilst at the same time he in it emerges from his single private interest, and has a conscious activity for a comparatively universal end, just as in his legal and professional duties he has his social morality.

CC. The State.

§ 535. The State is the *self-conscious* ethical substance, the unification of the family principle with that of civil society. The same unity, which is in the family as a feeling of love, is its essence, receiving however at the same time through the second principle of conscious and spontaneously active

volition the *form* of conscious universality. This universal principle, with all its evolution in detail, is the absolute aim and content of the knowing subject, which thus identifies itself in its volition with the system of reasonableness.

§ 536. The state is (α) its inward structure as a self-relating development — constitutional (inner-state) law: (β) a particular individual, and therefore in connexion with other particular individuals, — international (outer-state) law; (γ) but these particular minds are only stages in the general development of mind in its actuality: universal history.

α. Constitutional Law[167].

§ 537. The essence of the state is the universal, self-originated and self-developed, — the reasonable spirit of will; but, as self-knowing and self-actualising, sheer subjectivity, and — as an actuality — one individual. Its *work* generally — in relation to the extreme of individuality as the multitude of individuals — consists in a double function. First it maintains them as persons, thus making right a necessary actuality, then it promotes their welfare, which each originally takes care of for himself, but which has a thoroughly general side; it protects the family and guides civil society. Secondly, it carries back both, and the whole disposition and action of the individual — whose tendency is to become a centre of his own — into the life of the universal substance; and, in this direction, as a free power it interferes with those subordinate spheres and retains them in substantial immanence.

§ 538. The laws express the special provisions for objective freedom. First, to the immediate agent, his independent self-will and particular interest, they are restrictions. But, secondly, they are an absolute final end and the universal work: hence they are a product of the “functions” of the various orders which parcel themselves more and more out of the general

particularising, and are a fruit of all the acts and private concerns of individuals. Thirdly, they are the substance of the volition of individuals — which volition is thereby free — and of their disposition: being as such exhibited as current usage.

§ 539. As a living mind, the state only is as an organised whole, differentiated into particular agencies, which, proceeding from the one notion (though not known as notion) of the reasonable will, continually produce it as their result. The *constitution* is this articulation or organisation of state-power. It provides for the reasonable will, — in so far as it is in the individuals only *implicitly* the universal will, — coming to a consciousness and an understanding of itself and being *found*; also for that will being put in actuality, through the action of the government and its several branches, and not left to perish, but protected both against *their* casual subjectivity and against that of the individuals. The constitution is existent *justice*, — the actuality of liberty in the development all its reasonable provisions.

Liberty and Equality are the simple rubrics into which is frequently concentrated what should form the fundamental principle, the final aim and result of the constitution. However true this is, the defect of these terms is their utter abstractness: if stuck to in this abstract form, they are principles which either prevent the rise of the concreteness of the state, i.e. its articulation into a constitution and a government in general, or destroy them. With the state there arises inequality, the difference of governing powers and of governed, magistracies, authorities, directories, &c. The principle of equality, logically carried out, rejects all differences, and thus allows no sort of political condition to exist. Liberty and equality are indeed the foundation of the state, but as the most abstract also the most superficial, and for that very reason naturally the most familiar. It is important therefore to study them closer.

As regards, first, Equality, the familiar proposition, All men are by nature equal, blunders by confusing the "natural" with the "notion." It ought rather to read: *By nature* men are only unequal. But the notion of liberty, as it exists as such, without further specification and development, is abstract subjectivity, as a person capable of property (§ 488). This single abstract feature of personality constitutes the actual *equality* of human beings. But that this freedom should exist, that it should be *man* (and not as in Greece, Rome, &c. *some* men) that is recognised and legally regarded as a person, is so little *by nature*, that it is rather only a result and product of the consciousness of the deepest principle of mind, and of the universality and expansion of this consciousness. That the citizens are equal before the law contains a great truth, but which so expressed is a tautology: it only states that the legal status in general exists, that the laws rule. But, as regards the concrete, the citizens — besides their personality — are equal before the law only in these points when they are otherwise equal *outside the law*. Only that equality which (in whatever way it be) they, as it happens, otherwise have in property, age, physical strength, talent, skill, &c. — or even in crime, can and ought to make them deserve equal treatment before the law: — only it can make them — as regards taxation, military service, eligibility to office, &c. — punishment, &c. — equal in the concrete. The laws themselves, except in so far as they concern that narrow circle of personality, presuppose unequal conditions, and provide for the unequal legal duties and appurtenances resulting therefrom.

As regards Liberty, it is originally taken partly in a negative sense against arbitrary intolerance and lawless treatment, partly in the affirmative sense of subjective freedom; but this freedom is allowed great latitude both as regards the agent's self-will and action for his particular ends, and as regards his claim to have a personal intelligence and a personal share in general affairs. Formerly the legally defined rights, private as well as public

rights of a nation, town, &c. were called its "liberties." Really, every genuine law is a liberty: it contains a reasonable principle of objective mind; in other words, it embodies a liberty. Nothing has become, on the contrary, more familiar than the idea that each must *restrict* his liberty in relation to the liberty of others: that the state is a condition of such reciprocal restriction, and that the laws are restrictions. To such habits of mind liberty is viewed as only casual good-pleasure and self-will. Hence it has also been said that "modern" nations are only susceptible of equality, or of equality more than liberty: and that for no other reason than that, with an assumed definition of liberty (chiefly the participation of all in political affairs and actions), it was impossible to make ends meet in actuality — which is at once more reasonable and more powerful than abstract presuppositions. On the contrary, it should be said that it is just the great development and maturity of form in modern states which produces the supreme concrete inequality of individuals in actuality: while, through the deeper reasonableness of laws and the greater stability of the legal state, it gives rise to greater and more stable liberty, which it can without incompatibility allow. Even the superficial distinction of the words liberty and equality points to the fact that the former tends to inequality: whereas, on the contrary, the current notions of liberty only carry us back to equality. But the more we fortify liberty, — as security of property, as possibility for each to develop and make the best of his talents and good qualities, the more it gets taken for granted: and then the sense and appreciation of liberty especially turns in a *subjective* direction. By this is meant the liberty to attempt action on every side, and to throw oneself at pleasure in action for particular and for general intellectual interests, the removal of all checks on the individual particularity, as well as the inward liberty in which the subject has principles, has an insight and conviction of his own, and thus gains moral independence. But this liberty itself on one hand implies that

supreme differentiation in which men are unequal and make themselves more unequal by education; and on another it only grows up under conditions of that objective liberty, and is and could grow to such height only in modern states. If, with this development of particularity, there be simultaneous and endless increase of the number of wants, and of the difficulty of satisfying them, of the lust of argument and the fancy of detecting faults, with its insatiate vanity, it is all but part of that indiscriminating relaxation of individuality in this sphere which generates all possible complications, and must deal with them as it can. Such a sphere is of course also the field of restrictions, because liberty is there under the taint of natural self-will and self-pleasing, and has therefore to restrict itself: and that, not merely with regard to the naturalness, self-will and self-conceit, of others, but especially and essentially with regard to reasonable liberty.

The term political liberty, however, is often used to mean formal participation in the public affairs of state by the will and action even of those individuals who otherwise find their chief function in the particular aims and business of civil society. And it has in part become usual to give the title constitution only to the side of the state which concerns such participation of these individuals in general affairs, and to regard a state, in which this is not formally done, as a state without a constitution. On this use of the term, the only thing to remark is that by constitution must be understood the determination of rights, i.e. of liberties in general, and the organisation of the actualisation of them; and that political freedom in the above sense can in any case only constitute a part of it. Of it the following paragraphs will speak.

§ 540. The guarantee of a constitution (i.e. the necessity that the laws be reasonable, and their actualisation secured) lies in the collective spirit of the nation, — especially in the specific way in which it is itself conscious of its

reason. (Religion is that consciousness in its absolute substantiality.) But the guarantee lies also at the same time in the actual organisation or development of that principle in suitable institutions. The constitution presupposes that consciousness of the collective spirit, and conversely that spirit presupposes the constitution: for the actual spirit only has a definite consciousness of its principles, in so far as it has them actually existent before it.

The question — To whom (to what authority and how organised) belongs the power to make a constitution? is the same as the question, Who has to make the spirit of a nation? Separate our idea of a constitution from that of the collective spirit, as if the latter exists or has existed without a constitution, and your fancy only proves how superficially you have apprehended the nexus between the spirit in its self-consciousness and in its actuality. What is thus called "making" a "constitution," is — just because of this inseparability — a thing that has never happened in history, just as little as the making of a code of laws. A constitution only develops from the national spirit identically with that spirit's own development, and runs through at the same time with it the grades of formation and the alterations required by its concept. It is the indwelling spirit and the history of the nation (and, be it added, the history is only that spirit's history) by which constitutions have been and are made.

§ 541. The really living totality, — that which preserves, in other words continually produces the state in general and its constitution, is the *government*. The organisation which natural necessity gives is seen in the rise of the family and of the 'estates' of civil society. The government is the *universal* part of the constitution, i.e. the part which intentionally aims at preserving those parts, but at the same time gets hold of and carries out those general aims of the whole which rise above the function of the family and of civil society. The organisation of the government is likewise its

differentiation into powers, as their peculiarities have a basis in principle; yet without that difference losing touch with the *actual unity* they have in the notion's subjectivity.

As the most obvious categories of the notion are those of *universality* and *individuality* and their relationship that of *subsumption* of individual under universal, it has come about that in the state the legislative and executive power have been so distinguished as to make the former exist apart as the absolute superior, and to subdivide the latter again into administrative (government) power and judicial power, according as the laws are applied to public or private affairs. The *division* of these powers has been treated as *the* condition of political equilibrium, meaning by division their *independence* one of another in existence, — subject always however to the above-mentioned subsumption of the powers of the individual under the power of the general. The theory of such "division" unmistakably implies the elements of the notion, but so combined by "understanding" as to result in an absurd collocation, instead of the self-redintegration of the living spirit. The one essential canon to make liberty deep and real is to give every business belonging to the general interests of the state a separate organisation wherever they are essentially distinct. Such real division must be: for liberty is only deep when it is differentiated in all its fullness and these differences manifested in existence. But to make the business of legislation an independent power — to make it the first power, with the further proviso that all citizens shall have part therein, and the government be merely executive and dependent, presupposes ignorance that the true idea, and therefore the living and spiritual actuality, is the self-redintegrating notion, in other words, the subjectivity which contains in it universality as only one of its moments. (A mistake still greater, if it goes with the fancy that the constitution and the fundamental laws were still one day to make, — in a state of society, which includes an already existing

development of differences.) Individuality is the first and supreme principle *which* makes itself fall through the state's organisation. Only through the government, and by its embracing in itself the particular businesses (including the abstract legislative business, which taken apart is also particular), is the state *one*. These, as always, are the terms on which the different elements essentially and alone truly stand towards each other in the logic of "reason," as opposed to the external footing they stand on in 'understanding,' which never gets beyond subsuming the individual and particular under the universal. What disorganises the unity of logical reason, equally disorganises actuality.

§ 542. In the government — regarded as organic totality — the sovereign power (principate) is (*a*) *subjectivity* as the *infinite* self-unity of the notion in its development; — the all-sustaining, all-decreeing will of the state, its highest peak and all-pervasive unity. In the perfect form of the state, in which each and every element of the notion has reached free existence, this subjectivity is not a so-called "moral person," or a decree issuing from a majority (forms in which the unity of the decreeing will has not an *actual* existence), but an actual individual, — the will of a decreeing individual, — *monarchy*. The monarchical constitution is therefore the constitution of developed reason: all other constitutions belong to lower grades of the development and realisation of reason.

The unification of all concrete state-powers into one existence, as in the patriarchal society, — or, as in a democratic constitution, the participation of all in all affairs — impugns the principle of the division of powers, i.e. the developed liberty of the constituent factors of the Idea. But no whit less must the division (the working out of these factors each to a free totality) be reduced to "ideal" unity, i.e. to *subjectivity*. The mature differentiation or realisation of the Idea means, essentially, that this subjectivity should grow to be a *real* "moment," an *actual* existence; and this actuality is not

otherwise than as the individuality of the monarch — the subjectivity of abstract and final decision existent in *one* person. All those forms of collective decreeing and willing, — a common will which shall be the sum and the resultant (on aristocratical or democratical principles) of the atomistic of single wills, have on them the mark of the unreality of an abstraction. Two points only are all-important, first to see the necessity of each of the notional factors, and secondly the form in which it is actualised. It is only the nature of the speculative notion which can really give light on the matter. That subjectivity — being the "moment" which emphasises the need of abstract deciding in general — partly leads on to the proviso that the name of the monarch appear as the bond and sanction under which everything is done in the government; — partly, being simple self-relation, has attached to it the characteristic of *immediacy*, and then of *nature* — whereby the destination of individuals for the dignity of the princely power is fixed by inheritance.

§ 543. (*b*) In the *particular* government-power there emerges, first, the division of state-business into its branches (otherwise defined), legislative power, administration of justice or judicial power, administration and police, and its consequent distribution between particular boards or offices, which having their business appointed by law, to that end and for that reason, possess independence of action, without at the same time ceasing to stand under higher supervision. Secondly, too, there arises the participation of *several* in state-business, who together constitute the "general order" (§ 528) in so far as they take on themselves the charge of universal ends as the essential function of their particular life; — the further condition for being able to take individually part in this business being a certain training, aptitude, and skill for such ends.

§ 544. The estates-collegium or provincial council is an institution by which all such as belong to civil society in general, and are to that degree

private persons, participate in the governmental power, especially in legislation — viz. such legislation as concerns the universal scope of those interests which do not, like peace and war, involve the, as it were, personal interference and action of the State as one man, and therefore do not belong specially to the province of the sovereign power. By virtue of this participation subjective liberty and conceit, with their general opinion, can show themselves palpably efficacious and enjoy the satisfaction of feeling themselves to count for something.

The division of constitutions into democracy, aristocracy and monarchy, is still the most definite statement of their difference in relation to sovereignty. They must at the same time be regarded as necessary structures in the path of development, — in short, in the history of the State. Hence it is superficial and absurd to represent them as an object of *choice*. The pure forms — necessary to the process of evolution — are, in so far as they are finite and in course of change, conjoined both with forms of their degeneration, — such as ochlocracy, &c., and with earlier transition-forms. These two forms are not to be confused with those legitimate structures. Thus, it may be — if we look only to the fact that the will of one individual stands at the head of the state — oriental despotism is included under the vague name monarchy, — as also feudal monarchy, to which indeed even the favourite name of "constitutional monarchy" cannot be refused. The true difference of these forms from genuine monarchy depends on the true value of those principles of right which are in vogue and have their actuality and guarantee in the state-power. These principles are those expounded earlier, liberty of property, and above all personal liberty, civil society, with its industry and its communities, and the regulated efficiency of the particular bureaux in subordination to the laws.

The question which is most discussed is in what sense we are to understand the participation of private persons in state affairs. For it is as

private persons that the members of bodies of estates are primarily to be taken, be they treated as mere individuals, or as representatives of a number of people or of the nation. The aggregate of private persons is often spoken of as the *nation*: but as such an aggregate it is *vulgus*, not *populus*: and in this direction, it is the one sole aim of the state that a nation should *not* come to existence, to power and action, *as such an aggregate*. Such a condition of a nation is a condition of lawlessness, demoralisation, brutishness: in it the nation would only be a shapeless, wild, blind force, like that of the stormy, elemental sea, which however is not self-destructive, as the nation — a spiritual element — would be. Yet such a condition may be often heard described as that of true freedom. If there is to be any sense in embarking upon the question of the participation of private persons in public affairs, it is not a brutish mass, but an already organised nation — one in which a governmental power exists — which should be presupposed. The desirability of such participation however is not to be put in the superiority of particular intelligence, which private persons are supposed to have over state officials — the contrary may be the case — nor in the superiority of their good will for the general best. The members of civil society as such are rather people who find their nearest duty in their private interest and (as especially in the feudal society) in the interest of their privileged corporation. Take the case of *England* which, because private persons have a predominant share in public affairs, has been regarded as having the freest of all constitutions. Experience shows that that country — as compared with the other civilised states of Europe — is the most backward in civil and criminal legislation, in the law and liberty of property, in arrangements for art and science, and that objective freedom or rational right is rather *sacrificed* to formal right and particular private interest; and that this happens even in the institutions and possessions supposed to be dedicated to religion. The desirability of private persons taking part in

public affairs is partly to be put in their concrete, and therefore more urgent, sense of general wants. But the true motive is the right of the collective spirit to appear as an *externally universal* will, acting with orderly and express efficacy for the public concerns. By this satisfaction of this right it gets its own life quickened, and at the same time breathes fresh life in the administrative officials; who thus have it brought home to them that not merely have they to enforce duties but also to have regard to rights. Private citizens are in the state the incomparably greater number, and form the multitude of such as are recognised as persons. Hence the will-reason exhibits its existence in them as a preponderating majority of freemen, or in its "reflectional" universality, which has its actuality vouchsafed it as a participation in the sovereignty. But it has already been noted as a "moment" of civil society (§§ 527, 534) that the individuals rise from external into substantial universality, and form a *particular* kind, — the Estates: and it is not in the inorganic form of mere individuals as such (after the *democratic* fashion of election), but as organic factors, as estates, that they enter upon that participation. In the state a power or agency must never appear and act as a formless, inorganic shape, i.e. basing itself on the principle of multeity and mere numbers.

Assemblies of Estates have been wrongly designated as the *legislative power*, so far as they form only one branch of that power, — a branch in which the special government-officials have an *ex officio* share, while the sovereign power has the privilege of final decision. In a civilised state moreover legislation can only be a further modification of existing law, and so-called new laws can only deal with minutiae of detail and particularities (cf. § 529, note), the main drift of which has been already prepared or preliminarily settled by the practice of the law-courts. The so-called *financial law*, in so far as it requires the assent of the estates, is really a government affair: it is only improperly called a law, in the general sense of

embracing a wide, indeed the whole, range of the external means of government. The finances deal with what in their nature are only particular needs, ever newly recurring, even if they touch on the sum total of such needs. If the main part of the requirement were — as it very likely is — regarded as permanent, the provision for it would have more the nature of a law: but to be a law, it would have to be made once for all, and not be made yearly, or every few years, afresh. The part which varies according to time and circumstances concerns in reality the smallest part of the amount, and the provisions with regard to it have even less the character of a law: and yet it is and may be only this slight variable part which is matter of dispute, and can be subjected to a varying yearly estimate. It is this last then which falsely bears the high-sounding name of the "*Grant*" of the *Budget*, i.e. of the whole of the finances. A law for one year and made each year has even to the plain man something palpably absurd: for he distinguishes the essential and developed universal, as content of a true law, from the reflectional universality which only externally embraces what in its nature is many. To give the name of a law to the annual fixing of financial requirements only serves — with the presupposed separation of legislative from executive — to keep up the illusion of that separation having real existence, and to conceal the fact that the legislative power, when it makes a decree about finance, is really engaged with strict executive business. But the importance attached to the power of from time to time granting "supply," on the ground that the assembly of estates possesses in it a *check* on the government, and thus a guarantee against injustice and violence, — this importance is in one way rather plausible than real. The financial measures necessary for the state's subsistence cannot be made conditional on any other circumstances, nor can the state's subsistence be put yearly in doubt. It would be a parallel absurdity if the government were e.g. to grant and arrange the judicial institutions always for a limited time merely; and

thus, by the threat of suspending the activity of such an institution and the fear of a consequent state of brigandage, reserve for itself a means of coercing private individuals. Then again, the pictures of a condition of affairs, in which it might be useful and necessary to have in hand means of compulsion, are partly based on the false conception of a contract between rulers and ruled, and partly presuppose the possibility of such a divergence in spirit between these two parties as would make constitution and government quite out of the question. If we suppose the empty possibility of getting *help* by such compulsive means brought into existence, such help would rather be the derangement and dissolution of the state, in which there would no longer be a government, but only parties, and the violence and oppression of one party would only be helped away by the other. To fit together the several parts of the state into a constitution after the fashion of mere understanding — i.e. to adjust within it the machinery of a balance of powers external to each other — is to contravene the fundamental idea of what a state is.

§ 545. The final aspect of the state is to appear in immediate actuality as a single nation marked by physical conditions. As a single individual it is exclusive against other like individuals. In their mutual relations, waywardness and chance have a place; for each person in the aggregate is autonomous: the universal of law is only postulated between them, and not actually existent. This independence of a central authority reduces disputes between them to terms of mutual violence, a *state of war*, to meet which the general estate in the community assumes the particular function of maintaining the state's independence against other states, and becomes the estate of bravery.

§ 546. This state of war shows the omnipotence of the state in its individuality — an individuality that goes even to abstract negativity. Country and fatherland then appear as the power by which the particular

independence of individuals and their absorption in the external existence of possession and in natural life is convicted of its own nullity, — as the power which procures the maintenance of the general substance by the patriotic sacrifice on the part of these individuals of this natural and particular existence, — so making nugatory the nugatoriness that confronts it.

β. External Public Law[168].

§ 547. In the game of war the independence of States is at stake. In one case the result may be the mutual recognition of free national individualities (§ 430): and by peace-conventions supposed to be for ever, both this general recognition, and the special claims of nations on one another, are settled and fixed. External state-rights rest partly on these positive treaties, but to that extent contain only rights falling short of true actuality (§ 545): partly on so-called *international* law, the general principle of which is its presupposed recognition by the several States. It thus restricts their otherwise unchecked action against one another in such a way that the possibility of peace is left; and distinguishes individuals as private persons (non-belligerents) from the state. In general, international law rests on social usage.

γ. Universal History[169].

§ 548. As the mind of a special nation is actual and its liberty is under natural conditions, it admits on this nature-side the influence of geographical and climatic qualities. It is in time; and as regards its range and scope, has essentially a *particular* principle on the lines of which it must run through a development of its consciousness and its actuality. It has, in short, a history of its own. But as a restricted mind its independence is something secondary; it passes into universal world-history, the events of

which exhibit the dialectic of the several national minds, — the judgment of the world.

§ 549. This movement is the path of liberation for the spiritual substance, the deed by which the absolute final aim of the world is realised in it, and the merely implicit mind achieves consciousness and self-consciousness. It is thus the revelation and actuality of its essential and completed essence, whereby it becomes to the outward eye a universal spirit — a world-mind. As this development is in time and in real existence, as it is a history, its several stages and steps are the national minds, each of which, as single and endued by nature with a specific character, is appointed to occupy only one grade, and accomplish one task in the whole deed.

The presupposition that history has an essential and actual end, from the principles of which certain characteristic results logically flow, is called an *a priori* view of it, and philosophy is reproached with *a priori* history-writing. On this point, and on history-writing in general, this note must go into further detail. That history, and above all universal history, is founded on an essential and actual aim, which actually is and will be realised in it — the plan of Providence; that, in short, there is Reason in history, must be decided on strictly philosophical ground, and thus shown to be essentially and in fact necessary. To presuppose such aim is blameworthy only when the assumed conceptions or thoughts are arbitrarily adopted, and when a determined attempt is made to force events and actions into conformity with such conceptions. For such *a priori* methods of treatment at the present day, however, those are chiefly to blame who profess to be purely historical, and who at the same time take opportunity expressly to raise their voice against the habit of philosophising, first in general, and then in history. Philosophy is to them a troublesome neighbour: for it is an enemy of all arbitrariness and hasty suggestions. Such *a priori* history-writing has sometimes burst

out in quarters where one would least have expected it, especially on the philological side, and in Germany more than in France and England, where the art of historical writing has gone through a process of purification to a firmer and maturer character. Fictions, like that of a primitive age and its primitive people, possessed from the first of the true knowledge of God and all the sciences, — of sacerdotal races, — and, when we come to minutiae, of a Roman epic, supposed to be the source of the legends which pass current for the history of ancient Rome, &c., have taken the place of the pragmatising which detected psychological motives and associations. There is a wide circle of persons who seem to consider it incumbent on a *learned* and *ingenious* historian drawing from the original sources to concoct such baseless fancies, and form bold combinations of them from a learned rubbish-heap of out-of-the-way and trivial facts, in defiance of the best-accredited history.

Setting aside this subjective treatment of history, we find what is properly the opposite view forbidding us to import into history an *objective purpose*. This is after all synonymous with what *seems* to be the still more legitimate demand that the historian should proceed with *impartiality*. This is a requirement often and especially made on the *history of philosophy*: where it is insisted there should be no prepossession in favour of an idea or opinion, just as a judge should have no special sympathy for one of the contending parties. In the case of the judge it is at the same time assumed that he would administer his office ill and foolishly, if he had not an interest, and an exclusive interest in justice, if he had not that for his aim and one sole aim, or if he declined to judge at all. This requirement which we may make upon the judge may be called *partiality* for justice; and there is no difficulty here in distinguishing it from *subjective* partiality. But in speaking of the impartiality required from the historian, this self-satisfied insipid chatter lets the distinction disappear, and rejects both kinds of

interest. It demands that the historian shall bring with him no definite aim and view by which he may sort out, state and criticise events, but shall narrate them exactly in the casual mode he finds them, in their incoherent and unintelligent particularity. Now it is at least admitted that a history must have an object, e.g. Rome and its fortunes, or the Decline of the grandeur of the Roman empire. But little reflection is needed to discover that this is the presupposed end which lies at the basis of the events themselves, as of the critical examination into their comparative importance, i.e. their nearer or more remote relation to it. A history without such aim and such criticism would be only an imbecile mental divagation, not as good as a fairy tale, for even children expect a *motif* in their stories, a purpose at least dimly surmiseable with which events and actions are put in relation.

In the existence of a *nation* the substantial aim is to be a state and preserve itself as such. A nation with no state formation, (a *mere nation*), has strictly speaking no history, — like the nations which existed before the rise of states and others which still exist in a condition of savagery. What happens to a nation, and takes place within it, has its essential significance in relation to the state: whereas the mere particularities of individuals are at the greatest distance from the true object of history. It is true that the general spirit of an age leaves its imprint in the character of its celebrated individuals, and even their particularities are but the very distant and the dim media through which the collective light still plays in fainter colours. Ay, even such singularities as a petty occurrence, a word, express not a subjective particularity, but an age, a nation, a civilisation, in striking portraiture and brevity; and to select such trifles shows the hand of a historian of genius. But, on the other hand, the main mass of singularities is a futile and useless mass, by the painstaking accumulation of which the objects of real historical value are overwhelmed and obscured. The essential characteristic of the spirit and its age is always contained in the great

events. It was a correct instinct which sought to banish such portraiture of the particular and the gleaning of insignificant traits, into the *Novel* (as in the celebrated romances of Walter Scott, &c.). Where the picture presents an unessential aspect of life it is certainly in good taste to conjoin it with an unessential material, such as the romance takes from private events and subjective passions. But to take the individual pettinesses of an age and of the persons in it, and, in the interest of so-called truth, weave them into the picture of general interests, is not only against taste and judgment, but violates the principles of objective truth. The only truth for mind is the substantial and underlying essence, and not the trivialities of external existence and contingency. It is therefore completely indifferent whether such insignificancies are duly vouched for by documents, or, as in the romance, invented to suit the character and ascribed to this or that name and circumstances.

The point of interest of *Biography* — to say a word on that here — appears to run directly counter to any universal scope and aim. But biography too has for its background the historical world, with which the individual is intimately bound up: even purely personal originality, the freak of humour, &c. suggests by allusion that central reality and has its interest heightened by the suggestion. The mere play of sentiment, on the contrary, has another ground and interest than history.

The requirement of impartiality addressed to the history of philosophy (and also, we may add, to the history of religion, first in general, and secondly, to church history) generally implies an even more decided bar against presupposition of any objective aim. As the State was already called the point to which in political history criticism had to refer all events, so here the "*Truth*" must be the object to which the several deeds and events of the spirit would have to be referred. What is actually done is rather to make the contrary presupposition. Histories with such an object as religion or

philosophy are understood to have only subjective aims for their theme, i.e. only opinions and mere ideas, not an essential and realised object like the truth. And that with the mere excuse that there is no truth. On this assumption the sympathy with truth appears as only a partiality of the usual sort, a partiality for opinion and mere ideas, which all alike have no stuff in them, and are all treated as indifferent. In that way historical truth means but correctness — an accurate report of externals, without critical treatment save as regards this correctness — admitting, in this case, only qualitative and quantitative judgments, no judgments of necessity or notion (cf. notes to §§ 172 and 175). But, really, if Rome or the German empire, &c. are an actual and genuine object of political history, and the aim to which the phenomena are to be related and by which they are to be judged; then in universal history the genuine spirit, the consciousness of it and of its essence, is even in a higher degree a true and actual object and theme, and an aim to which all other phenomena are essentially and actually subservient. Only therefore through their relationship to it, i.e. through the judgment in which they are subsumed under it, while it inheres in them, have they their value and even their existence. It is the spirit which not merely broods *over* history as over the waters, but lives in it and is alone its principle of movement: and in the path of that spirit, liberty, i.e. a development determined by the notion of spirit, is the guiding principle and only its notion its final aim, i.e. truth. For Spirit is consciousness. Such a doctrine — or in other words that Reason is in history — will be partly at least a plausible faith, partly it is a cognition of philosophy.

§ 550. This liberation of mind, in which it proceeds to come to itself and to realise its truth, and the business of so doing, is the supreme right, the absolute Law. The self-consciousness of a particular nation is a vehicle for the contemporary development of the collective spirit in its actual existence: it is the objective actuality in which that spirit for the time invests its will.

Against this absolute will the other particular natural minds have no rights: *that* nation dominates the world: but yet the universal will steps onward over its property for the time being, as over a special grade, and then delivers it over to its chance and doom.

§ 551. To such extent as this business of actuality appears as an action, and therefore as a work of *individuals*, these individuals, as regards the substantial issue of their labour, are *instruments*, and their subjectivity, which is what is peculiar to them, is the empty form of activity. What they personally have gained therefore through the individual share they took in the substantial business (prepared and appointed independently of them) is a formal universality or subjective mental idea — *Fame*, which is their reward.

§ 552. The national spirit contains nature-necessity, and stands in external existence (§ 423): the ethical substance, potentially infinite, is actually a particular and limited substance (§§ 549, 550); on its subjective side it labours under contingency, in the shape of its unreflective natural usages, and its content is presented to it as something *existing* in time and tied to an external nature and external world. The spirit, however, (which *thinks* in this moral organism) overrides and absorbs within itself the finitude attaching to it as national spirit in its state and the state's temporal interests, in the system of laws and usages. It rises to apprehend itself in its essentiality. Such apprehension, however, still has the immanent limitedness of the national spirit. But the spirit which thinks in universal history, stripping off at the same time those limitations of the several national minds and its own temporal restrictions, lays hold of its concrete universality, and rises to apprehend the absolute mind, as the eternally actual truth in which the contemplative reason enjoys freedom, while the necessity of nature and

the necessity of history are only ministrant to its revelation and the vessels of its honour.

The strictly technical aspects of the Mind's elevation to God have been spoken of in the Introduction to the Logic (cf. especially § 51, note). As regards the starting-point of that elevation, Kant has on the whole adopted the most correct, when he treats belief in God as proceeding from the practical Reason. For that starting-point contains the material or content which constitutes the content of the notion of God. But the true concrete material is neither Being (as in the cosmological) nor mere action by design (as in the physico-theological proof) but the Mind, the absolute characteristic and function of which is effective reason, i.e. the self-determining and self-realising notion itself, — Liberty. That the elevation of subjective mind to God which these considerations give is by Kant again deposed to a *postulate* — a mere "ought" — is the peculiar perversity, formerly noticed, of calmly and simply reinstating as true and valid that very antithesis of finitude, the supersession of which into truth is the essence of that elevation.

As regards the "mediation" which, as it has been already shown (§ 192, cf. § 204 note), that elevation to God really involves, the point specially calling for note is the "moment" of negation through which the essential content of the starting-point is purged of its finitude so as to come forth free. This factor, abstract in the formal treatment of logic, now gets its most concrete interpretation. The finite, from which the start is now made, is the real ethical self-consciousness. The negation through which that consciousness raises its spirit to its truth, is the purification, *actually* accomplished in the ethical world, whereby its conscience is purged of subjective opinion and its will freed from the selfishness of desire. Genuine religion and genuine religiosity only issue from the moral life: religion is that life rising to think, i.e. becoming aware of the free universality of its

concrete essence. Only from the moral life and by the moral life is the Idea of God seen to be free spirit: outside the ethical spirit therefore it is vain to seek for true religion and religiosity.

But — as is the case with all speculative process — this development of one thing out of another means that what appears as sequel and derivative is rather the absolute *prius* of what it appears to be mediated by, and what is here in mind known as its truth.

Here then is the place to go more deeply into the reciprocal relations between the state and religion, and in doing so to elucidate the terminology which is familiar and current on the topic. It is evident and apparent from what has preceded that moral life is the state retracted into its inner heart and substance, while the state is the organisation and actualisation of moral life; and that religion is the very substance of the moral life itself and of the state. At this rate, the state rests on the ethical sentiment, and that on the religious. If religion then is the consciousness of *"absolute" truth*, then whatever is to rank as right and justice, as law and duty, i.e. as *true* in the world of free will, can be so esteemed only as it is participant in that truth, as it is subsumed under it and is its sequel. But if the truly moral life is to be a sequel of religion, then perforce religion must have the *genuine* content; i.e. the idea of God it knows must be the true and real. The ethical life is the divine spirit as indwelling in self-consciousness, as it is actually present in a nation and its individual members. This self-consciousness retiring upon itself out of its empirical actuality and bringing its truth to consciousness, has in its *faith* and in its *conscience* only what it has consciously secured in its spiritual actuality. The two are inseparable: there cannot be two kinds of conscience, one religious and another ethical, differing from the former in body and value of truth. But in point of form, i.e. for thought and knowledge — (and religion and ethical life belong to intelligence and are a thinking and knowing) — the body of religious truth, as the pure self-

subsisting and therefore supreme truth, exercises a sanction over the moral life which lies in empirical actuality. Thus for self-consciousness religion is the "basis" of moral life and of the state. It has been the monstrous blunder of our times to try to look upon these inseparables as separable from one another, and even as mutually indifferent. The view taken of the relationship of religion and the state has been that, whereas the state had an independent existence of its own, springing from some force and power, religion was a later addition, something desirable perhaps for strengthening the political bulwarks, but purely subjective in individuals: — or it may be, religion is treated as something without effect on the moral life of the state, i.e. its reasonable law and constitution which are based on a ground of their own.

As the inseparability of the two sides has been indicated, it may be worth while to note the separation as it appears on the side of religion. It is primarily a point of form: the attitude which self-consciousness takes to the body of truth. So long as this body of truth is the very substance or indwelling spirit of self-consciousness in its actuality, then self-consciousness in this content has the certainty of itself and is free. But if this present self-consciousness is lacking, then there may be created, in point of form, a condition of spiritual slavery, even though the *implicit* content of religion is absolute spirit. This great difference (to cite a specific case) comes out within the Christian religion itself, even though here it is not the nature-element in which the idea of God is embodied, and though nothing of the sort even enters as a factor into its central dogma and sole theme of a God who is known in spirit and in truth. And yet in Catholicism this spirit of all truth is in actuality set in rigid opposition to the self-conscious spirit. And, first of all, God is in the "host" presented to religious adoration as an *external thing*. (In the Lutheran Church, on the contrary, the host as such is not at first consecrated, but in the moment of enjoyment, i.e.

in the annihilation of its externality, and in the act of faith, i.e. in the free self-certain spirit: only then is it consecrated and exalted to be present God.) From that first and supreme status of externalisation flows every other phase of externality, — of bondage, non-spirituality, and superstition. It leads to a laity, receiving its knowledge of divine truth, as well as the direction of its will and conscience from without and from another order — which order again does not get possession of that knowledge in a spiritual way only, but to that end essentially requires an external consecration. It leads to the non-spiritual style of praying — partly as mere moving of the lips, partly in the way that the subject foregoes his right of directly addressing God, and prays others to pray — addressing his devotion to miracle-working images, even to bones, and expecting miracles from them. It leads, generally, to justification by external works, a merit which is supposed to be gained by acts, and even to be capable of being transferred to others. All this binds the spirit under an externalism by which the very meaning of spirit is perverted and misconceived at its source, and law and justice, morality and conscience, responsibility and duty are corrupted at their root.

Along with this principle of spiritual bondage, and these applications of it in the religious life, there can only go in the legislative and constitutional system a legal and moral bondage, and a state of lawlessness and immorality in political life. Catholicism has been loudly praised and is still often praised — logically enough — as the one religion which secures the stability of governments. But in reality this applies only to governments which are bound up with institutions founded on the bondage of the spirit (of that spirit which should have legal and moral liberty), i.e. with institutions that embody injustice and with a morally corrupt and barbaric state of society. But these governments are not aware that in fanaticism they have a terrible power, which does not rise in hostility against them,

only so long as and only on condition that they remain sunk in the thraldom of injustice and immorality. But in mind there is a very different power available against that externalism and dismemberment induced by a false religion. Mind collects itself into its inward free actuality. Philosophy awakes in the spirit of governments and nations the wisdom to discern what is essentially and actually right and reasonable in the real world. It was well to call these products of thought, and in a special sense Philosophy, the wisdom of the world[170]; for thought makes the spirit's truth an actual present, leads it into the real world, and thus liberates it in its actuality and in its own self.

Thus set free, the content of religion assumes quite another shape. So long as the form, i.e. our consciousness and subjectivity, lacked liberty, it followed necessarily that self-consciousness was conceived as not immanent in the ethical principles which religion embodies, and these principles were set at such a distance as to seem to have true being only as negative to actual self-consciousness. In this unreality ethical content gets the name of *Holiness*. But once the divine spirit introduces itself into actuality, and actuality emancipates itself to spirit, then what in the world was a postulate of holiness is supplanted by the actuality of *moral* life. Instead of the vow of chastity, *marriage* now ranks as the ethical relation; and, therefore, as the highest on this side of humanity stands the family. Instead of the vow of poverty (muddled up into a contradiction of assigning merit to whosoever gives away goods to the poor, i.e. whosoever enriches them) is the precept of action to acquire goods through one's own intelligence and industry, — of honesty in commercial dealing, and in the use of property, — in short moral life in the socio-economic sphere. And instead of the vow of obedience, true religion sanctions obedience to the law and the legal arrangements of the state — an obedience which is itself the true freedom, because the state is a self-possessed, self-realising reason

— in short, moral life in the state. Thus, and thus only, can law and morality exist. The precept of religion, "Give to Caesar what is Caesar's and to God what is God's" is not enough: the question is to settle what is Caesar's, what belongs to the secular authority: and it is sufficiently notorious that the secular no less than the ecclesiastical authority have claimed almost everything as their own. The divine spirit must interpenetrate the entire secular life: whereby wisdom is concrete within it, and it carries the terms of its own justification. But that concrete indwelling is only the aforesaid ethical organisations. It is the morality of marriage as against the sanctity of a celibate order; — the morality of economic and industrial action against the sanctity of poverty and its indolence; — the morality of an obedience dedicated to the law of the state as against the sanctity of an obedience from which law and duty are absent and where conscience is enslaved. With the growing need for law and morality and the sense of the spirit's essential liberty, there sets in a conflict of spirit with the religion of unfreedom. It is no use to organise political laws and arrangements on principles of equity and reason, so long as in religion the principle of unfreedom is not abandoned. A free state and a slavish religion are incompatible. It is silly to suppose that we may try to allot them separate spheres, under the impression that their diverse natures will maintain an attitude of tranquillity one to another and not break out in contradiction and battle. Principles of civil freedom can be but abstract and superficial, and political institutions deduced from them must be, if taken alone, untenable, so long as those principles in their wisdom mistake religion so much as not to know that the maxims of the reason in actuality have their last and supreme sanction in the religious conscience in subsumption under the consciousness of "absolute" truth. Let us suppose even that, no matter how, a code of law should arise, so to speak *a priori*, founded on principles of reason, but in contradiction with an established religion based on principles of spiritual

unfreedom; still, as the duty of carrying out the laws lies in the hands of individual members of the government, and of the various classes of the administrative *personnel*, it is vain to delude ourselves with the abstract and empty assumption that the individuals will act only according to the letter or meaning of the law, and not in the spirit of their religion where their inmost conscience and supreme obligation lies. Opposed to what religion pronounces holy, the laws appear something made by human hands: even though backed by penalties and externally introduced, they could offer no lasting resistance to the contradiction and attacks of the religious spirit. Such laws, however sound their provisions may be, thus founder on the conscience, whose spirit is different from the spirit of the laws and refuses to sanction them. It is nothing but a modern folly to try to alter a corrupt moral organisation by altering its political constitution and code of laws without changing the religion, — to make a revolution without having made a reformation, to suppose that a political constitution opposed to the old religion could live in peace and harmony with it and its sanctities, and that stability could be procured for the laws by external guarantees, e.g. so-called "chambers," and the power given them to fix the budget, &c. (cf. § 544 note). At best it is only a temporary expedient — when it is obviously too great a task to descend into the depths of the religious spirit and to raise that same spirit to its truth — to seek to separate law and justice from religion. Those guarantees are but rotten bulwarks against the consciences of the persons charged with administering the laws — among which laws these guarantees are included. It is indeed the height and profanity of contradiction to seek to bind and subject to the secular code the religious conscience to which mere human law is a thing profane.

The perception had dawned upon Plato with great clearness of the gulf which in his day had commenced to divide the established religion and the political constitution, on one hand, from those deeper requirements which,

on the other hand, were made upon religion and politics by liberty which had learnt to recognise its inner life. Plato gets hold of the thought that a genuine constitution and a sound political life have their deeper foundation on the Idea, — on the essentially and actually universal and genuine principles of eternal righteousness. Now to see and ascertain what these are is certainly the function and the business of *philosophy*. It is from this point of view that Plato breaks out into the celebrated or notorious passage where he makes Socrates emphatically state that philosophy and political power must coincide, that the Idea must be regent, if the distress of nations is to see its end. What Plato thus definitely set before his mind was that the Idea — which implicitly indeed is the free self-determining thought — could not get into consciousness save only in the form of a thought; that the substance of the thought could only be true when set forth as a universal, and as such brought to consciousness under its most abstract form.

To compare the Platonic standpoint in all its definiteness with the point of view from which the relationship of state and religion is here regarded, the notional differences on which everything turns must be recalled to mind. The first of these is that in natural things their substance or genus is different from their existence in which that substance is as subject: further that this subjective existence of the genus is distinct from that which it gets, when specially set in relief as genus, or, to put it simply, as the universal in a mental concept or idea. This additional "individuality" — the soil on which the universal and underlying principle *freely* and expressly exists, — is the intellectual and thinking *self*. In the case of *natural* things their truth and reality does not get the form of universality and essentiality through themselves, and their "individuality" is not itself the form: the form is only found in subjective thinking, which in philosophy gives that universal truth and reality an existence of its own. In man's case it is otherwise: his truth and reality is the free mind itself, and it comes to existence in his self-

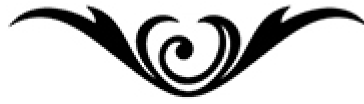
consciousness. This absolute nucleus of man — mind intrinsically concrete — is just this — to have the form (to have thinking) itself for a content. To the height of the thinking consciousness of this principle Aristotle ascended in his notion of the entelechy of thought, (which is νοῆσις τῆς νοήσεως), thus surmounting the Platonic Idea (the genus, or essential being). But thought always — and that on account of this very principle — contains the immediate self-subsistence of subjectivity no less than it contains universality; the genuine Idea of the intrinsically concrete mind is just as essentially under the one of its terms (subjective consciousness) as under the other (universality): and in the one as in the other it is the same substantial content. Under the subjective form, however, fall feeling, intuition, pictorial representation: and it is in fact necessary that in point of time the consciousness of the absolute Idea should be first reached and apprehended in this form: in other words, it must exist in its immediate reality as religion, earlier than it does as philosophy. Philosophy is a later development from this basis (just as Greek philosophy itself is later than Greek religion), and in fact reaches its completion by catching and comprehending in all its definite essentiality that principle of spirit which first manifests itself in religion. But Greek philosophy could set itself up only in opposition to Greek religion: the unity of thought and the substantiality of the Idea could take up none but a hostile attitude to an imaginative polytheism, and to the gladsome and frivolous humours of its poetic creations. The *form* in its infinite truth, the *subjectivity* of mind, broke forth at first only as a subjective free *thinking*, which was not yet identical with the *substantiality* itself, — and thus this underlying principle was not yet apprehended as *absolute mind*. Thus religion might appear as first purified only through philosophy, — through pure self-existent thought: but the form pervading this underlying principle — the form which philosophy attacked — was that creative imagination.

Political power, which is developed similarly, but earlier than philosophy, from religion, exhibits the onesidedness, which in the actual world may infect its *implicitly* true Idea, as demoralisation. Plato, in common with all his thinking contemporaries, perceived this demoralisation of democracy and the defectiveness even of its principle; he set in relief accordingly the underlying principle of the state, but could not work into his idea of it the infinite form of subjectivity, which still escaped his intelligence. His state is therefore, on its own showing, wanting in subjective liberty (§ 503 note, § 513, &c.). The truth which should be immanent in the state, should knit it together and control it, he, for these reasons, got hold of only the form of thought-out truth, of philosophy; and hence he makes that utterance that "so long as philosophers do not rule in the states, or those who are now called kings and rulers do not soundly and comprehensively philosophise, so long neither the state nor the race of men can be liberated from evils, — so long will the idea of the political constitution fall short of possibility and not see the light of the sun." It was not vouchsafed to Plato to go on so far as to say that so long as true religion did not spring up in the world and hold sway in political life, so long the genuine principle of the state had not come into actuality. But so long too this principle could not emerge even in thought, nor could thought lay hold of the genuine idea of the state, — the idea of the substantial moral life, with which is identical the liberty of an independent self-consciousness. Only in the principle of mind, which is aware of its own essence, is implicitly in absolute liberty, and has its actuality in the act of self-liberation, does the absolute possibility and necessity exist for political power, religion, and the principles of philosophy coinciding in one, and for accomplishing the reconciliation of actuality in general with the mind, of the state with the religious conscience as well as with the philosophical consciousness. Self-realising subjectivity is in this case absolutely identical

with substantial universality. Hence religion as such, and the state as such, — both as forms in which the principle exists — each contain the absolute truth: so that the truth, in its philosophic phase, is after all only in one of its forms. But even religion, as it grows and expands, lets other aspects of the Idea of humanity grow and expand also (§ 500 sqq.). As it is left therefore behind, in its first immediate, and so also one-sided phase, Religion may, or rather *must*, appear in its existence degraded to sensuous externality, and thus in the sequel become an influence to oppress liberty of spirit and to deprave political life. Still the principle has in it the infinite "elasticity" of the "absolute" form, so as to overcome this depraving of the form-determination (and of the content by these means), and to bring about the reconciliation of the spirit in itself. Thus ultimately, in the Protestant conscience the principles of the religious and of the ethical conscience come to be one and the same: the free spirit learning to see itself in its reasonableness and truth. In the Protestant state, the constitution and the code, as well as their several applications, embody the principle and the development of the moral life, which proceeds and can only proceed from the truth of religion, when reinstated in its original principle and in that way as such first become actual. The moral life of the state and the religious spirituality of the state are thus reciprocal guarantees of strength.

Section III. Absolute Mind[171].

§ 553. THE *notion* of mind has its *reality* in the mind. If this reality in identity with that notion is to exist as the consciousness of the absolute Idea, then the necessary aspect is that the *implicitly* free intelligence be in its actuality liberated to its notion, if that actuality is to be a vehicle worthy of it. The subjective and the objective spirit are to be looked on as the road on which this aspect of *reality* or existence rises to maturity.



§ 554. The absolute mind, while it is self-centred *identity*, is always also identity returning and ever returned into itself: if it is the one and universal *substance* it is so as a spirit, discerning itself into a self and a consciousness, for which it is as substance. *Religion*, as this supreme sphere may be in general designated, if it has on one hand to be studied as issuing from the subject and having its home in the subject, must no less be regarded as objectively issuing from the absolute spirit which as spirit is in its community.

That here, as always, belief or faith is not opposite to consciousness or knowledge, but rather to a sort of knowledge, and that belief is only a particular form of the latter, has been remarked already (§ 63 note). If nowadays there is so little consciousness of God, and his objective essence is so little dwelt upon, while people speak so much more of the subjective side of religion, i.e. of God's indwelling in us, and if that and not the truth as such is called for, — in this there is at least the correct principle that God must be apprehended as spirit in his community.

§ 555. The subjective consciousness of the absolute spirit is essentially and intrinsically a process, the immediate and substantial unity of which is the *Belief* in the witness of the spirit as the *certainty* of objective truth.

Belief, at once this immediate unity and containing it as a reciprocal dependence of these different terms, has in *devotion* — the implicit or more explicit act of worship (*cultus*) — passed over into the process of superseding the contrast till it becomes spiritual liberation, the process of authenticating that first certainty by this intermediation, and of gaining its concrete determination, viz. reconciliation, the actuality of the spirit.

Sub-Section A. Art.

§ 556. As this consciousness of the Absolute first takes shape, its immediacy produces the factor of finitude in Art. On one hand that is, it breaks up into a work of external common existence, into the subject which produces that work, and the subject which contemplates and worships it. But, on the other hand, it is the concrete *contemplation* and mental picture of implicitly absolute spirit as the *Ideal*. In this ideal, or the concrete shape born of the subjective spirit, its natural immediacy, which is only a *sign* of the Idea, is so transfigured by the informing spirit in order to express the Idea, that the figure shows it and it alone: — the shape or form of *Beauty*.

§ 557. The sensuous externality attaching to the beautiful, — the *form of immediacy* as such, — at the same time *qualifies* what it *embodies*: and the God (of art) has with his spirituality at the same time the stamp upon him of a natural medium or natural phase of existence — He contains the so-called *unity* of nature and spirit — i.e. the immediate unity in sensuously intuitional form — hence not the spiritual unity, in which the natural would be put only as "ideal," as superseded in spirit, and the spiritual content would be only in self-relation. It is not the absolute spirit which enters this consciousness. On the subjective side the community has of course an ethical life, aware, as it is, of the spirituality of its essence: and its self-consciousness and actuality are in it elevated to substantial liberty. But with the stigma of immediacy upon it, the subject's liberty is only a *manner of life*, without the infinite self-reflection and the subjective inwardness of *conscience*. These considerations govern in their further developments the devotion and the worship in the religion of fine art.

§ 558. For the objects of contemplation it has to produce, Art requires not only an external given material — (under which are also included subjective images and ideas), but — for the expression of spiritual truth — must use the given forms of nature with a significance which art must divine and possess (cf. § 411). Of all such forms the human is the highest and the true, because only in it can the spirit have its corporeity and thus its visible expression.

This disposes of the principle of the *imitation of nature* in art: a point on which it is impossible to come to an understanding while a distinction is left thus abstract, — in other words, so long as the natural is only taken in its externality, not as the "characteristic" meaningful nature-form which is significant of spirit.

§ 559. In such single shapes the "absolute" mind cannot be made explicit: in and to art therefore the spirit is a limited natural spirit whose implicit universality, when steps are taken to specify its fullness in detail, breaks up into an indeterminate polytheism. With the essential restrictedness of its content, Beauty in general goes no further than a penetration of the vision or image by the spiritual principle, — something formal, so that the thought embodied, or the idea, can, like the material which it uses to work in, be of the most diverse and unessential kind, and still the work be something beautiful and a work of art.

§ 560. The one-sidedness of *immediacy* on the part of the Ideal involves the opposite one-sidedness (§ 556) that it is something *made* by the artist. The subject or agent is the mere technical activity: and the work of art is only then an expression of the God, when there is no sign of subjective particularity in it, and the net power of the indwelling spirit is conceived and born into the world, without admixture and unspotted from its contingency. But as liberty only goes as far as there is thought, the action

inspired with the fullness of this indwelling power, the artist's *enthusiasm*, is like a foreign force under which he is bound and passive; the artistic *production* has on its part the form of natural immediacy, it belongs to the *genius* or particular endowment of the artist, — and is at the same time a labour concerned with technical cleverness and mechanical externalities. The work of art therefore is just as much a work due to free option, and the artist is the master of the God.

§ 561. In work so inspired the reconciliation appears so obvious in its initial stage that it is without more ado accomplished in the subjective self-consciousness, which is thus self-confident and of good cheer, without the depth and without the sense of its antithesis to the absolute essence. On the further side of the perfection (which is reached in such reconciliation, in the beauty of *classical art*) lies the art of sublimity, — *symbolic art*, in which the figuration suitable to the Idea is not yet found, and the thought as going forth and wrestling with the figure is exhibited as a negative attitude to it, and yet all the while toiling to work itself into it. The meaning or theme thus shows it has not yet reached the infinite form, is not yet known, not yet conscious of itself, as free spirit. The artist's theme only is as the abstract God of pure thought, or an effort towards him, — a restless and unappeased effort which throws itself into shape after shape as it vainly tries to find its goal.

§ 562. In another way the Idea and the sensuous figure it appears in are incompatible; and that is where the infinite form, subjectivity, is not as in the first extreme a mere superficial personality, but its inmost depth, and God is known not as only seeking his form or satisfying himself in an external form, but as only finding himself in himself, and thus giving himself his adequate figure in the spiritual world alone. *Romantic art* gives up the task of showing him as such in external form and by means of beauty: it presents him as only condescending to appearance, and the divine

as the heart of hearts in an externality from which it always disengages itself. Thus the external can here appear as contingent towards its significance.

The Philosophy of Religion has to discover the logical necessity in the progress by which the Being, known as the Absolute, assumes fuller and firmer features; it has to note to what particular feature the kind of cultus corresponds, — and then to see how the secular self-consciousness, the consciousness of what is the supreme vocation of man, — in short how the nature of a nation's moral life, the principle of its law, of its actual liberty, and of its constitution, as well as of its art and science, corresponds to the principle which constitutes the substance of a religion. That all these elements of a nation's actuality constitute one systematic totality, that one spirit creates and informs them, is a truth on which follows the further truth that the history of religions coincides with the world-history.

As regards the close connexion of art with the various religions it may be specially noted that *beautiful* art can only belong to those religions in which the spiritual principle, though concrete and intrinsically free, is not yet absolute. In religions where the Idea has not yet been revealed and known in its free character, though the craving for art is felt in order to bring in imaginative visibility to consciousness the idea of the supreme being, and though art is the sole organ in which the abstract and radically indistinct content, — a mixture from natural and spiritual sources, — can try to bring itself to consciousness; — still this art is defective; its form is defective because its subject-matter and theme is so, — for the defect in subject-matter comes from the form not being immanent in it. The representations of this symbolic art keep a certain tastelessness and stolidity — for the principle it embodies is itself stolid and dull, and hence has not the power freely to transmute the external to significance and shape. Beautiful art, on the contrary, has for its condition the self-consciousness of the free spirit, —

the consciousness that compared with it the natural and sensuous has no standing of its own: it makes the natural wholly into the mere expression of spirit, which is thus the inner form that gives utterance to itself alone.

But with a further and deeper study, we see that the advent of art, in a religion still in the bonds of sensuous externality, shows that such religion is on the decline. At the very time it seems to give religion the supreme glorification, expression and brilliancy, it has lifted the religion away over its limitation. In the sublime divinity to which the work of art succeeds in giving expression the artistic genius and the spectator find themselves at home, with their personal sense and feeling, satisfied and liberated: to them the vision and the consciousness of free spirit has been vouchsafed and attained. Beautiful art, from its side, has thus performed the same service as philosophy: it has purified the spirit from its thraldom. The older religion in which the need of fine art, and just for that reason, is first generated, looks up in its principle to an other-world which is sensuous and unmeaning: the images adored by its devotees are hideous idols regarded as wonder-working talismans, which point to the unspiritual objectivity of that other world, — and bones perform a similar or even a better service than such images. But even fine art is only a grade of liberation, not the supreme liberation itself. — The genuine objectivity, which is only in the medium of thought, — the medium in which alone the pure spirit is for the spirit, and where the liberation is accompanied with reverence, — is still absent in the sensuous beauty of the work of art, still more in that external, unbeautiful sensuousness.

§ 563. Beautiful Art, like the religion peculiar to it, has its future in true religion. The restricted value of the Idea passes utterly and naturally into the universality identical with the infinite form; — the vision in which consciousness has to depend upon the senses passes into a self-mediating knowledge, into an existence which is itself knowledge, — into *revelation*.

Thus the principle which gives the Idea its content is that it embody free intelligence, and as "absolute" *spirit it is for the spirit*.

Sub-Section B. Revealed Religion[172].

§ 564. It lies essentially in the notion of religion, — the religion i.e. whose content is absolute mind — that it be *revealed*, and, what is more, revealed *by God*. Knowledge (the principle by which the substance is mind) is a self-determining principle, as infinite self-realising form, — it therefore is manifestation out and out. The spirit is only spirit in so far as it is for the spirit, and in the absolute religion it is the absolute spirit which manifests no longer abstract elements of its being but itself.

The old conception — due to a one-sided survey of human life — of Nemesis, which made the divinity and its action in the world only a levelling power, dashing to pieces everything high and great, — was confronted by Plato and Aristotle with the doctrine that God is not *envious*. The same answer may be given to the modern assertions that man cannot ascertain God. These assertions (and more than assertions they are not) are the more illogical, because made within a religion which is expressly called the revealed; for according to them it would rather be the religion in which nothing of God was revealed, in which he had not revealed himself, and those belonging to it would be the heathen "who know not God." If the word of God is taken in earnest in religion at all, it is from Him, the theme and centre of religion, that the method of divine knowledge may and must begin: and if self-revelation is refused Him, then the only thing left to constitute His nature would be to ascribe envy to Him. But clearly if the word Mind is to have a meaning, it implies the revelation of Him.

If we recollect how intricate is the knowledge of the divine Mind for those who are not content with the homely pictures of faith but proceed to thought, — at first only "rationalising" reflection, but afterwards, as in duty

bound, to speculative comprehension, it may almost create surprise that so many, and especially theologians whose vocation it is to deal with these Ideas, have tried to get off their task by gladly accepting anything offered them for this behoof. And nothing serves better to shirk it than to adopt the conclusion that man knows nothing of God. To know what God as spirit is — to apprehend this accurately and distinctly in thoughts — requires careful and thorough speculation. It includes, in its fore-front, the propositions: God is God only so far as he knows himself: his self-knowledge is, further, his self-consciousness in man, and man's knowledge *of* God, which proceeds to man's self-knowledge in God. — See the profound elucidation of these propositions in the work from which they are taken: *Aphorisms on Knowing and Not-knowing, &c.*, by C. F. G — l.: Berlin 1829.

§ 565. When the immediacy and sensuousness of shape and knowledge is superseded, God is, in point of content, the essential and actual spirit of nature and spirit, while in point of form he is, first of all, presented to consciousness as a mental representation. This quasi-pictorial representation gives to the elements of his content, on one hand, a separate being, making them presuppositions towards each other, and phenomena which succeed each other; their relationship it makes a series of events according to finite reflective categories. But, on the other hand, such a form of finite representationalism is also overcome and superseded in the faith which realises one spirit and in the devotion of worship.

§ 566. In this separating, the form parts from the content: and in the form the different functions of the notion part off into special spheres or media, in each of which the absolute spirit exhibits itself; (α) as eternal content, abiding self-centred, even in its manifestation; (β) as distinction of the eternal essence from its manifestation, which by this difference becomes the phenomenal world into which the content enters; (γ) as infinite return, and

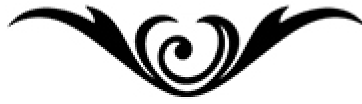
reconciliation with the eternal being, of the world it gave away — the withdrawal of the eternal from the phenomenal into the unity of its fullness.

§ 567. (α) Under the "moment" of *Universality*, — the sphere of pure thought or the abstract medium of essence, — it is therefore the absolute spirit, which is at first the presupposed principle, not however staying aloof and inert, but (as underlying and essential power under the reflective category of causality) creator of heaven and earth: but yet in this eternal sphere rather only begetting himself as his *son*, with whom, though different, he still remains in original identity, — just as, again, this differentiation of him from the universal essence eternally supersedes itself, and, though this mediating of a self-superseding mediation, the first substance is essentially as *concrete individuality* and subjectivity, — is the *Spirit*.

§ 568. (β) Under the "moment" of *particularity*, or of judgment, it is this concrete eternal being which is presupposed: its movement is the creation of the phenomenal world. The eternal "moment" of mediation — of the only Son — divides itself to become the antithesis of two separate worlds. On one hand is heaven and earth, the elemental and the concrete nature, — on the other hand, standing in action and reaction with such nature, the spirit, which therefore is finite. That spirit, as the extreme of inherent negativity, completes its independence till it becomes wickedness, and is that extreme through its connexion with a confronting nature and through its own naturalness thereby investing it. Yet, amid that naturalness, it is, when it thinks, directed towards the Eternal, though, for that reason, only standing to it in an external connexion.

§ 569. (γ) Under the "moment" of *individuality* as such, — of subjectivity and the notion itself, in which the contrast of universal and particular has sunk to its identical ground, the place of presupposition (1) is taken by the *universal* substance, as actualised out of its abstraction into an

individual self-consciousness. This individual, who as such is identified with the essence, — (in the Eternal sphere he is called the Son) — is transplanted into the world of time, and in him wickedness is implicitly overcome. Further, this immediate, and thus sensuous, existence of the absolutely concrete is represented as putting himself in judgment and expiring in the pain of *negativity*, in which he, as infinite subjectivity, keeps himself unchanged, and thus, as absolute return from that negativity and as universal unity of universal and individual essentiality, has realised his being as the Idea of the spirit, eternal, but alive and present in the world.



§ 570. (2) This objective totality of the divine man who is the Idea of the spirit is the implicit presupposition for the *finite* immediacy of the single subject. For such subject therefore it is at first an Other, an object of contemplating vision, — but the vision of implicit truth, through which witness of the spirit in him, he, on account of his immediate nature, at first characterised himself as nought and wicked. But, secondly, after the example of his truth, by means of the faith on the unity (in that example implicitly accomplished) of universal and individual essence, he is also the movement to throw off his immediacy, his natural man and self-will, to close himself in unity with that example (who is his implicit life) in the pain of negativity, and thus to know himself made one with the essential Being. Thus the Being of Beings (3) through this mediation brings about its own indwelling in self-consciousness, and is the actual presence of the essential and self-subsisting spirit who is all in all.

§ 571. These three syllogisms, constituting the one syllogism of the absolute self-mediation of spirit, are the revelation of that spirit whose life is set out as a cycle of concrete shapes in pictorial thought. From this its separation into parts, with a temporal and external sequence, the unfolding of the mediation contracts itself in the result, — where the spirit closes in unity with itself, — not merely to the simplicity of faith and devotional

feeling, but even to thought. In the immanent simplicity of thought the unfolding still has its expansion, yet is all the while known as an indivisible coherence of the universal, simple, and eternal spirit in itself. In this form of truth, truth is the object of *philosophy*.

If the result — the realised Spirit in which all meditation has superseded itself — is taken in a merely formal, contentless sense, so that the spirit is not also at the same time known as *implicitly* existent and objectively self-unfolding; — then that infinite subjectivity is the merely formal self-consciousness, knowing itself in itself as absolute, — Irony. Irony, which can make every objective reality nought and vain, is itself the emptiness and vanity, which from itself, and therefore by chance and its own good pleasure, gives itself direction and content, remains master over it, is not bound by it, — and, with the assertion that it stands on the very summit of religion and philosophy, falls rather back into the vanity of wilfulness. It is only in proportion as the pure infinite form, the self-centred manifestation, throws off the one-sidedness of subjectivity in which it is the vanity of thought, that it is the free thought which has its infinite characteristic at the same time as essential and actual content, and has that content as an object in which it is also free. Thinking, so far, is only the formal aspect of the absolute content.

Sub-Section C. Philosophy.

§ 572. THIS science is the unity of Art and Religion. Whereas the vision-method of Art, external in point of form, is but subjective production and shivers the substantial content into many separate shapes, and whereas Religion, with its separation into parts, opens it out in mental picture, and mediates what is thus opened out; Philosophy not merely keeps them together to make a total, but even unifies them into the simple spiritual vision, and then in that raises them to self-conscious thought. Such consciousness is thus the intelligible unity (cognised by thought) of art and religion, in which the diverse elements in the content are cognised as necessary, and this necessary as free.

§ 573. Philosophy thus characterises itself as a cognition of the necessity in the content of the absolute picture-idea, as also of the necessity in the two forms — on one hand, immediate vision and its poetry, and the objective and external revelation presupposed by representation, — on the other hand, first the subjective retreat inwards, then the subjective movement of faith and its final identification with the presupposed object. This cognition is thus the *recognition* of this content and its form; it is the liberation from the one-sidedness of the forms, elevation of them into the absolute form, which determines itself to content, remains identical with it, and is in that the cognition of that essential and actual necessity. This movement, which philosophy is, finds itself already accomplished, when at the close it seizes its own notion, — i.e. only *looks back* on its knowledge.

Here might seem to be the place to treat in a definite exposition of the reciprocal relations of philosophy and religion. The whole question turns entirely on the difference of the forms of speculative thought from the

forms of mental representation and "reflecting" intellect. But it is the whole cycle of philosophy, and of logic in particular, which has not merely taught and made known this difference, but also criticised it, or rather has let its nature develop and judge itself by these very categories. It is only by an insight into the value of these forms that the true and needful conviction can be gained, that the content of religion and philosophy is the same, — leaving out, of course, the further details of external nature and finite mind which fall outside the range of religion. But religion is the truth *for all men*: faith rests on the witness of the spirit, which as witnessing is the spirit in man. This witness — the underlying essence in all humanity — takes, when driven to expound itself, its first definite form under those acquired habits of thought which his secular consciousness and intellect otherwise employs. In this way the truth becomes liable to the terms and conditions of finitude in general. This does not prevent the spirit, even in employing sensuous ideas and finite categories of thought, from retaining its content (which as religion is essentially speculative,) with a tenacity which does violence to them, and acts *inconsistently* towards them. By this inconsistency it corrects their defects. Nothing easier therefore for the "Rationalist" than to point out contradictions in the exposition of the faith, and then to prepare triumphs for its principle of formal identity. If the spirit yields to this finite reflection, which has usurped the title of reason and philosophy — ("Rationalism") — it strips religious truth of its infinity and makes it in reality nought. Religion in that case is completely in the right in guarding herself against such reason and philosophy and treating them as enemies. But it is another thing when religion sets herself against comprehending reason, and against philosophy in general, and specially against a philosophy of which the doctrine is speculative, and so religious. Such an opposition proceeds from failure to appreciate the difference indicated and the value of spiritual form in general, and particularly of the logical form;

or, to be more precise, still from failure to note the distinction of the content — which may be in both the same — from these forms. It is on the ground of form that philosophy has been reproached and accused by the religious party; just as conversely its speculative content has brought the same charges upon it from a self-styled philosophy — and from a pithless orthodoxy. It had too little of God in it for the former; too much for the latter.

The charge of *Atheism*, which used often to be brought against philosophy (that it has *too little* of God), has grown rare: the more wide-spread grows the charge of Pantheism, that it has *too much* of him: — so much so, that it is treated not so much as an imputation, but as a proved fact, or a sheer fact which needs no proof. Piety, in particular, which with its pious airs of superiority fancies itself free to dispense with proof, goes hand in hand with empty rationalism — (which means to be so much opposed to it, though both repose really on the same habit of mind) — in the wanton assertion, almost as if it merely mentioned a notorious fact, that Philosophy is the All-one doctrine, or Pantheism. It must be said that it was more to the credit of piety and theology when they accused a philosophical system (e.g. Spinozism) of Atheism than of Pantheism, though the former imputation at the first glance looks more cruel and insidious (cf. § 71 note). The imputation of Atheism presupposes a definite idea of a full and real God, and arises because the popular idea does not detect in the philosophical notion the peculiar form to which it is attached. Philosophy indeed can recognise its own forms in the categories of religious consciousness, and even its own teaching in the doctrine of religion — which therefore it does not disparage. But the converse is not true: the religious consciousness does not apply the criticism of thought to itself, does not comprehend itself, and is therefore, as it stands, exclusive. To impute Pantheism instead of Atheism to Philosophy is part of the modern habit of mind — of the new piety and

new theology. For them philosophy has too much of God: — so much so, that, if we believe them, it asserts that God is everything and everything is God. This new theology, which makes religion only a subjective feeling and denies the knowledge of the divine nature, thus retains nothing more than a God in general without objective characteristics. Without interest of its own for the concrete, fulfilled notion of God, it treats it only as an interest which *others* once had, and hence treats what belongs to the doctrine of God's concrete nature as something merely historical. The indeterminate God is to be found in all religions; every kind of piety (§ 72) — that of the Hindoo to asses, cows, — or to dalai-lamas, — that of the Egyptians to the ox — is always adoration of an object which, with all its absurdities, also contains the generic abstract, God in General. If this theory needs no more than such a God, so as to find God in everything called religion, it must at least find such a God recognised even in philosophy, and can no longer accuse it of Atheism. The mitigation of the reproach of Atheism into that of Pantheism has its ground therefore in the superficial idea to which this mildness has attenuated and emptied God. As that popular idea clings to its abstract universality, from which all definite quality is excluded, all such definiteness is only the non-divine, the secularity of things, thus left standing in fixed undisturbed substantiality. On such a presupposition, even after philosophy has maintained God's absolute universality, and the consequent untruth of the being of external things, the hearer clings as he did before to his belief that secular things still keep their being, and form all that is definite in the divine universality. He thus changes that universality into what he calls the pantheistic: — *Everything is* — (empirical things, without distinction, whether higher or lower in the scale, *are*) — all possess substantiality; and so — thus he understands philosophy — each and every secular thing is God. It is only his own stupidity, and the falsifications due

to such misconception, which generate the imagination and the allegation of such pantheism.

But if those who give out that a certain philosophy is Pantheism, are unable and unwilling to see this — for it is just to see the notion that they refuse — they should before everything have verified the alleged fact that *any one philosopher, or any one man*, had really ascribed substantial or objective and inherent reality to *all* things and regarded them as God: — that such an idea had ever come into the hand of any body but themselves. This allegation I will further elucidate in this exoteric discussion: and the only way to do so is to set down the evidence. If we want to take so-called Pantheism in its most poetical, most sublime, or if you will, its grossest shape, we must, as is well known, consult the oriental poets: and the most copious delineations of it are found in Hindoo literature. Amongst the abundant resources open to our disposal on this topic, I select — as the most authentic statement accessible — the Bhagavat-Gita, and amongst its effusions, prolix and reiterative *ad nauseam*, some of the most telling passages. In the 10th Lesson (in Schlegel, p. 162) Krishna says of himself[173]:— "I am the self, seated in the hearts of all beings. I am the beginning and the middle and the end also of all beings ... I am the beaming sun amongst the shining ones, and the moon among the lunar mansions.... Amongst the Vedas I am the Sâma-Veda: I am mind amongst the senses: I am consciousness in living beings. And I am Sankara (Siva) among the Rudras, ... Meru among the high-topped mountains, ... the Himalaya among the firmly-fixed (mountains).... Among beasts I am the lord of beasts.... Among letters I am the letter A.... I am the spring among the seasons.... I am also that which is the seed of all things: there is nothing moveable or immoveable which can exist without me."

Even in these totally sensuous delineations, Krishna (and we must not suppose there is, besides Krishna, still God, or a God besides; as he said

before he was Siva, or Indra, so it is afterwards said that Brahma too is in him) makes himself out to be — not everything, but only — the most excellent of everything. Everywhere there is a distinction drawn between external, unessential existences, and one essential amongst them, which he is. Even when, at the beginning of the passage, he is said to be the beginning, middle, and end of living things, this totality is distinguished from the living things themselves as single existences. Even such a picture which extends deity far and wide in its existence cannot be called pantheism: we must rather say that in the infinitely multiple empirical world, everything is reduced to a limited number of essential existences, to a polytheism. But even what has been quoted shows that these very substantialities of the externally-existent do not retain the independence entitling them to be named Gods; even Siva, Indra, &c. melt into the one Krishna.

This reduction is more expressly made in the following scene (7th Lesson, p. 7 sqq.). Krishna says: "I am the producer and the destroyer of the whole universe. There is nothing else higher than myself; all this is woven upon me, like numbers of pearls upon a thread. I am the taste in water;... I am the light of the sun and the moon; I am 'Om' in all the Vedas.... I am life in all beings.... I am the discernment of the discerning ones.... I am also the strength of the strong." Then he adds: "The whole universe deluded by these three states of mind developed from the qualities [sc. goodness, passion, darkness] does not know me who am beyond them and inexhaustible: for this delusion of mine," [even the Maya is *his*, nothing independent], "developed from the qualities is divine and difficult to transcend. Those cross beyond this delusion who resort to me alone." Then the picture gathers itself up in a simple expression: "At the end of many lives, the man possessed of knowledge approaches me, (believing) that Vasudeva is everything. Such a high-souled mind is very hard to find. Those

who are deprived of knowledge by various desires approach other divinities... Whichever form of deity one worships with faith, from it he obtains the beneficial things he desires really given by me. But the fruit thus obtained by those of little judgment is perishable.... The undiscerning ones, not knowing my transcendent and inexhaustible essence, than which there is nothing higher, think me who am unperceived to have become perceptible."

This "All," which Krishna calls himself, is not, any more than the Eleatic One, and the Spinozan Substance, the Every-thing. This every-thing, rather, the infinitely-manifold sensuous manifold of the finite is in all these pictures, but defined as the "accidental," without essential being of its very own, but having its truth in the substance, the One which, as different from that accidental, is alone the divine and God. Hindooism however has the higher conception of Brahma, the pure unity of thought in itself, where the empirical everything of the world, as also those proximate substantialities, called Gods, vanish. On that account Colebrooke and many others have described the Hindoo religion as at bottom a Monotheism. That this description is not incorrect is clear from these short citations. But so little concrete is this divine unity — spiritual as its idea of God is — so powerless its grip, so to speak — that Hindooism, with a monstrous inconsistency, is also the maddest of polytheisms. But the idolatry of the wretched Hindoo, when he adores the ape, or other creature, is still a long way from that wretched fancy of a Pantheism, to which everything is God, and God everything. Hindoo monotheism moreover is itself an example how little comes of mere monotheism, if the Idea of God is not deeply determinate in itself. For that unity, if it be intrinsically abstract and therefore empty, tends of itself to let whatever is concrete, outside it — be it as a lot of Gods or as secular, empirical individuals — keep its independence. That pantheism indeed — on the shallow conception of it — might with a show of logic as well be called a monotheism: for if God, as it

says, is identical with the world, then as there is only one world there would be in that pantheism only one God. Perhaps the empty numerical unity must be predicated of the world: but such abstract predication of it has no further special interest; on the contrary, a mere numerical unity just means that its *content* is an infinite multeity and variety of finitudes. But it is that delusion with the empty unity, which alone makes possible and induces the wrong idea of pantheism. It is only the picture — floating in the indefinite blue — of the world as *one thing*, *the all*, that could ever be considered capable of combining with God: only on that assumption could philosophy be supposed to teach that God is the world: for if the world were taken as it is, as everything, as the endless lot of empirical existence, then it would hardly have been even held possible to suppose a pantheism which asserted of such stuff that it is God.

But to go back again to the question of fact. If we want to see the consciousness of the One — not as with the Hindoos split between the featureless unity of abstract thought, on one hand, and on the other, the long-winded weary story of its particular detail, but — in its finest purity and sublimity, we must consult the Mohammedans. If e.g. in the excellent Jelaleddin-Rumi in particular, we find the unity of the soul with the One set forth, and that unity described as love, this spiritual unity is an exaltation above the finite and vulgar, a transfiguration of the natural and the spiritual, in which the externalism and transitoriness of immediate nature, and of empirical secular spirit, is discarded and absorbed[174].

I refrain from accumulating further examples of the religious and poetic conceptions which it is customary to call pantheistic. Of the philosophies to which that name is given, the Eleatic, or Spinozist, it has been remarked earlier (§ 50, note) that so far are they from identifying God with the world and making him finite, that in these systems this "everything" has no truth,

and that we should rather call them monotheistic, or, in relation to the popular idea of the world, acosmical. They are most accurately called systems which apprehend the Absolute only as substance. Of the oriental, especially the Mohammedan, modes of envisaging God, we may rather say that they represent the Absolute as the utterly universal genus which dwells in the species or existences, but dwells so potently that these existences have no actual reality. The fault of all these modes of thought and systems is that they stop short of defining substance as subject and as mind.

These systems and modes of pictorial conception originate from the one need common to all philosophies and all religions of getting an idea of God, and, secondly, of the relationship of God and the world. (In philosophy it is specially made out that the determination of God's nature determines his relations with the world.) The "reflective" understanding begins by rejecting all systems and modes of conception, which, whether they spring from heart, imagination or speculation, express the interconnexion of God and the world: and in order to have God pure in faith or consciousness, he is as essence parted from appearance, as infinite from the finite. But, after this partition, the conviction arises also that the appearance has a relation to the essence, the finite to the infinite, and so on: and thus arises the question of reflection as to the nature of this relation. It is in the reflective form that the whole difficulty of the affair lies, and that causes this relation to be called incomprehensible by the agnostic. The close of philosophy is not the place, even in a general exoteric discussion, to waste a word on what a "notion" means. But as the view taken of this relation is closely connected with the view taken of philosophy generally and with all imputations against it, we may still add the remark that though philosophy certainly has to do with unity in general, it is not however with abstract unity, mere identity, and the empty absolute, but with concrete unity (the notion), and that in its whole course it has to do with nothing else; — that each step in its advance is a

peculiar term or phase of this concrete unity, and that the deepest and last expression of unity is the unity of absolute mind itself. Would-be judges and critics of philosophy might be recommended to familiarise themselves with these phases of unity and to take the trouble to get acquainted with them, at least to know so much that of these terms there are a great many, and that amongst them there is great variety. But they show so little acquaintance with them — and still less take trouble about it — that, when they hear of unity — and relation *ipso facto* implies unity — they rather stick fast at quite abstract indeterminate unity, and lose sight of the chief point of interest — the special mode in which the unity is qualified. Hence all they can say about philosophy is that dry identity is its principle and result, and that it is the system of identity. Sticking fast to the undigested thought of identity, they have laid hands on, not the concrete unity, the notion and content of philosophy, but rather its reverse. In the philosophical field they proceed, as in the physical field the physicist; who also is well aware that he has before him a variety of sensuous properties and matters — or usually matters alone, (for the properties get transformed into matters also for the physicist) — and that these matters (elements) *also* stand in *relation* to one another. But the question is, Of what kind is this relation? Every peculiarity and the whole difference of natural things, inorganic and living, depend solely on the different modes of this unity. But instead of ascertaining these different modes, the ordinary physicist (chemist included) takes up only one, the most external and the worst, viz. *composition*, applies only it in the whole range of natural structures, which he thus renders for ever inexplicable.

The aforesaid shallow pantheism is an equally obvious inference from this shallow identity. All that those who employ this invention of their own to accuse philosophy gather from the study of God's *relation* to the world is that the one, but only the one factor of this category of relation — and that

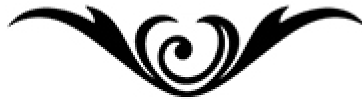
the factor of indeterminateness — is identity. Thereupon they stick fast in this half-perception, and assert — falsely as a fact — that philosophy teaches the identity of God and the world. And as in their judgment either of the two, — the world as much as God — has the same solid substantiality as the other, they infer that in the philosophic Idea God is *composed* of God and the world. Such then is the idea they form of pantheism, and which they ascribe to philosophy. Unaccustomed in their own thinking and apprehending of thoughts to go beyond such categories, they import them into philosophy, where they are utterly unknown; they thus infect it with the disease against which they subsequently raise an outcry. If any difficulty emerge in comprehending God's relation to the world, they at once and very easily escape it by admitting that this relation contains for them an inexplicable contradiction; and that hence, they must stop at the vague conception of such relation, perhaps under the more familiar names of, e.g. omnipresence, providence, &c. Faith in their use of the term means no more than a refusal to define the conception, or to enter on a closer discussion of the problem. That men and classes of untrained intellect are satisfied with such indefiniteness, is what one expects; but when a trained intellect and an interest for reflective study is satisfied, in matters admitted to be of superior, if not even of supreme interest, with indefinite ideas, it is hard to decide whether the thinker is really in earnest with the subject. But if those who cling to this crude "rationalism" were in earnest, e.g. with God's omnipresence, so far as to realise their faith thereon in a definite mental idea, in what difficulties would they be involved by their belief in the true reality of the things of sense! They would hardly like, as Epicurus does, to let God dwell in the interspaces of things, i.e. in the pores of the physicists, — said pores being the negative, something supposed to exist *beside* the material reality. This very "Beside" would give their pantheism its spatiality, — their everything, conceived as the mutual

exclusion of parts in space. But in ascribing to God, in his relation to the world, an action on and in the space thus filled on the world and in it, they would endlessly split up the divine actuality into infinite materiality. They would really thus have the misconception they call pantheism or all-one-doctrine, only as the necessary sequel of their misconceptions of God and the world. But to put that sort of thing, this stale gossip of oneness or identity, on the shoulders of philosophy, shows such recklessness about justice and truth that it can only be explained through the difficulty of getting into the head thoughts and notions, i.e. not abstract unity, but the many-shaped modes specified. If statements as to facts are put forward, and the facts in question are thoughts and notions, it is indispensable to get hold of their meaning. But even the fulfilment of this requirement has been rendered superfluous, now that it has long been a foregone conclusion that philosophy is pantheism, a system of identity, an All-one doctrine, and that the person therefore who might be unaware of this fact is treated either as merely unaware of a matter of common notoriety, or as prevaricating for a purpose. On account of this chorus of assertions, then, I have believed myself obliged to speak at more length and exoterically on the outward and inward untruth of this alleged fact: for exoteric discussion is the only method available in dealing with the external apprehension of notions as mere facts, — by which notions are perverted into their opposite. The esoteric study of God and identity, as of cognitions and notions, is philosophy itself.

§ 574. This notion of philosophy is the self-thinking Idea, the truth aware of itself (§ 236), — the logical system, but with the signification that it is universality approved and certified in concrete content as in its actuality. In this way the science has gone back to its beginning: its result is the logical system but as a spiritual principle: out of the presupposing judgment, in which the notion was only implicit and the beginning an immediate, — and

thus out of the *appearance* which it had there — it has risen into its pure principle and thus also into its proper medium.

§ 575. It is this appearing which originally gives the motive of the further development. The first appearance is formed by the syllogism, which is based on the Logical system as starting-point, with Nature for the middle term which couples the Mind with it. The Logical principle turns to Nature and Nature to Mind. Nature, standing between the Mind and its essence, sunders itself, not indeed to extremes of finite abstraction, nor itself to something away from them and independent, — which, as other than they, only serves as a link between them: for the syllogism is *in the Idea* and Nature is essentially defined as a transition-point and negative factor, and as implicitly the Idea. Still the mediation of the notion has the external form of *transition*, and the science of Nature presents itself as the course of necessity, so that it is only in the one extreme that the liberty of the notion is explicit as a self-amalgamation.



§ 576. In the second syllogism this appearance is so far superseded, that that syllogism is the standpoint of the Mind itself, which — as the mediating agent in the process — presupposes Nature and couples it with the Logical principle. It is the syllogism where Mind reflects on itself in the Idea: philosophy appears as a subjective cognition, of which liberty is the aim, and which is itself the way to produce it.

§ 577. The third syllogism is the Idea of philosophy, which has self-knowing reason, the absolutely-universal, for its middle term: a middle, which divides itself into Mind and Nature, making the former its presupposition, as process of the Idea's subjective activity, and the latter its universal extreme, as process of the objectively and implicitly existing Idea. The self-judging of the Idea into its two appearances (§§ 575, 576) characterises both as its (the self-knowing reason's) manifestations: and in it there is a unification of the two aspects: — it is the nature of the fact, the

notion, which causes the movement and development, yet this same movement is equally the action of cognition. The eternal Idea, in full fruition of its essence, eternally sets itself to work, engenders and enjoys itself as absolute Mind.

Ἡ δὲ νόησις ἡ καθ᾽ αὑτὴν τοῦ καθ᾽ αὑτὸ ἀρίστου, καὶ ἡ μάλιστα τοῦ μάλιστα. Αὑτὸν δὲ νοεῖ ὁ νοῦς κατὰ μετάληψιν τοῦ νοητοῦ νοητὸς γὰρ γίγνεται θιγγάνων καὶ νοῶν, ὥστε ταὐτὸν νοῦς καὶ νοητόν. Τὸ γὰρ δεκτικὸν τοῦ νοητοῦ καὶ τῆς οὐσίας νοῦς. Ἐνεργεῖ δὲ ἔχων. Ὥστ᾽ ἐκεῖνο μᾶλλον τούτου ὃ δοκεῖ ὁ νοῦς θεῖον ἔχειν, καὶ ἡ θεωρία τὸ ἥδιστον καὶ ἄριστον. Εἰ οὖν οὕτως εὖ ἔχει, ὡς ἡμεῖς ποτέ, ὁ θεὸς ἀεί, θαυμαστόν; εἰ δὲ μᾶλλον, ἔτι θαυμασιώτερον. Ἔχει δὲ ὡδί. Καὶ ζωὴ δέ γε ὑπάρχει; ἡ γὰρ νοῦ ἐνέργεια ζωή, ἐκεῖνος δὲ ἡ ἐνέργεια; ἐνέργεια δὲ ἡ καθ᾽ αὑτὴν ἐκείνου ζωὴ ἀρίστη καὶ ἀΐδιος. Φαμὲν δὲ τὸν θεὸν εἶναι ζῷον ἀΐδιον ἄριστον, ὥστε ζωὴ αἰὼν συνεχὴς καὶ ἀΐδιος ὑπάρχει τῷ θεῷ; τοῦτο γὰρ ὁ θεός. (Arist. *Met.* XI. 7.)

ENDNOTES.

1

Plato, *Rep.* 527.

2

The prospectus of the *System of Synthetic Philosophy* is dated 1860. Darwin's *Origin of Species* is 1859. But such ideas, both in Mr. Spencer and others, are earlier than Darwin's book.

3

Hegel's *Verhältniss*, the supreme category of what is called actuality: where object is necessitated by outside object.

4

Cf. Herbart, *Werke* (ed. Kehrbach), iv. 372. This consciousness proper is what Leibniz called *« Apperception, » la connaissance réflexive de l'état intérieur (Nouveaux Essais)*.

5

Herbart, *Werke*, vi. 55 (ed. Kehrbach).

6

p. 59 (§ 440).

7

p. 63 (§ 440).

8

These remarks refer to four out of the five Herbartian ethical ideas. See also Leibniz, who (in 1693, *De Notionibus juris et justitiae*) had given the following definitions: "Caritas est benevolentia

universalis. Justitia est caritas sapientis. Sapientia est scientia felicitatis.” The jus naturae has three grades: the lowest, jus strictum; the second, aequitas (or caritas, in the narrower sense); and the highest, pietas, which is honeste, i.e. pie vivere.

9

To which the Greek πόλις, the Latin civitas or respublica, were only approximations. Hegel *is not writing a history*. If he were, it would be necessary for him to point out how far the individual instance, e.g. Rome, or Prussia, corresponded to its Idea.

10

Shakespeare’s phrase, as in *Othello*, iii. 2; *Lover’s Complaint*, v. 24.

11

Iliad, xii. 243.

12

See Hegel’s *Logic*, pp. 257 seq.

13

See p. 153 (§ 550).

14

27

Lehrbuch der Psychologie, §§ 202, 203.

28

Allgemeine Metaphysik, Vorrede.

29

Hauptpunkte der Metaphysik (1806), § 13.

30

Werke, ed. Kehrbach (*Ueber die Möglichkeit*, &c), v. 96.

31

Ibid., p. 100.

32

One might almost fancy Herbart was translating into a general philosophic thesis the words in which Goethe has described how he overcame a real trouble by transmuting it into an ideal shape, e.g. *Wahrheit und Dichtung*, cap. xii.

33

Herbart's language is almost identical with Hegel's: *Encycl.* § 389 (p. 12). Cf. Spencer, *Psychology*, i. 192. "Feelings are in all cases the materials out of which the superior tracts of consciousness and intellect are evolved."

34

Prolegomena to the Study of Hegel, ch. xvii.

35

Psychologia Empirica, § 29.

36

As is also the case with Herbart's metaphysical reality of the Soul.

37

Human Nature, vii. 2. "Pleasure, Love, and appetite, which is also called desire, are divers names for divers considerations of the same thing...." Deliberation is (ch. xii. 1) the "alternate succession of appetite and fears."

38

Eth. ii. 48 Schol.

39

Eth. ii. 43 Schol.: cf. 49 Schol.

40

This wide scope of thinking (*cogitatio*, *penser*) is at least as old as the Cartesian school: and should be kept in view, as against a tendency to narrow its range to the mere intellect.

41

e.g. *Analysis of the Human Mind*, ch. xxiv. "Attention is but another name for the interesting character of the idea;" ch. xix. "Desire and the idea of a pleasurable sensation are convertible terms."

42

As Mr. Spencer says (*Psychology*, i. 141), "Objective psychology can have no existence as such without borrowing its data from subjective psychology."

43

The same failure to note that experiment is valuable only where general points of view are defined, is a common fault in biology.

44

Münsterberg, *Aufgaben und Methoden der Psychologie*, p. 144.

45

Lehrbuch der Psychologie, § 54 (2nd ed.), or § 11 (1st ed.).

46

See p. 11 (§ 387).

47

Cf. Nietzsche, *Also sprach Zarathustra*, i. 43. “There is more reason in thy body than in thy best wisdom.”

48

This language is very characteristic of the physicists who dabble in psychology and imagine they are treading in the steps of Kant, if not even verifying what they call his guesswork: cf. Ziehen, *Physiol. Psychologie*, 2nd ed. p. 212. “In every case there is given us only the psychical series of sensations and their memory-images, and it is only a universal hypothesis if we assume beside this psychical series a material series standing in causal relation to it.... The material series is not given equally originally with the psychical.”

49

It is the same radical feature of consciousness which is thus noted by Mr. Spencer, *Psychology*, i. 475. “Perception and sensation are ever tending to exclude each other but never succeed.” “Cognition and feeling are antithetical and inseparable.” “Consciousness continues only in virtue of this conflict.” Cf. Plato’s resolution in the *Philebus* of the contest between intelligence and feeling (pleasure).

50

It is the quasi-Aristotelian ἀπαγωγή, defined as the step from one proposition to another, the knowledge of which will set the first proposition in a full light.

122

Die fühlende Seele.

123

Plato had a better idea of the relation of prophecy generally to the state of sober consciousness than many moderns, who supposed that the Platonic language on the subject of enthusiasm authorised their belief in the sublimity of the revelations of somnambulistic vision. Plato says in the *Timaeus* (p. 71), "The author of our being so ordered our inferior parts that they too might obtain a measure of truth, and in the liver placed their oracle (the power of divination by dreams). And herein is a proof that God has given the art of divination, not to the wisdom, but, to the foolishness of man; for no man when in his wits attains prophetic truth and inspiration; but when he receives the inspired word, either his intelligence is enthralled by sleep, or he is demented by some distemper or possession (enthusiasm)." Plato very correctly notes not merely the bodily conditions on which such visionary knowledge depends, and the possibility of the truth of the dreams, but also the inferiority of them to the reasonable frame of mind.

124

[The citation given by Hegel from Schlegel's translation is here replaced by the version (in one or two points different) in the *Sacred Books of the East*, vol. viii]

174

In order to give a clearer impression of it, I cannot refrain from quoting a few passages, which may at the same time give some indication of the marvellous skill of Rückert, from whom they are taken, as a translator. [For Rückert's verses a version is here substituted in which I have been kindly helped by Miss May Kendall]

III.

I saw but One through all heaven's starry spaces gleaming:
I saw but One in all sea billows wildly streaming.
I looked into the heart, a waste of worlds, a sea, —
I saw a thousand dreams, — yet One amid all dreaming.
And earth, air, water, fire, when thy decree is given,
Are molten into One: against thee none hath striven.
There is no living heart but beats unfailingly
In the one song of praise to thee, from earth and heaven.

V.

As one ray of thy light appears the noonday sun,
But yet thy light and mine eternally are one.
As dust beneath thy feet the heaven that rolls on high:
Yet only one, and one for ever, thou and I.
The dust may turn to heaven, and heaven to dust decay;
Yet art thou one with me, and shalt be one for aye.
How may the words of life that fill heaven's utmost part
Rest in the narrow casket of one poor human heart?
How can the sun's own rays, a fairer gleam to fling,

Hide in a lowly husk, the jewel's covering?
How may the rose-grove all its glorious bloom unfold,
Drinking in mire and slime, and feeding on the mould?
How can the darksome shell that sips the salt sea stream
Fashion a shining pearl, the sunlight's joyous beam?
Oh, heart! should warm winds fan thee, should'st thou floods endure,
One element are wind and flood; but be thou pure.

IX.

I'll tell thee how from out the dust God moulded man, —
Because the breath of Love He breathed into his clay:
I'll tell thee why the spheres their whirling paths began, —
They mirror to God's throne Love's glory day by day:
I'll tell thee why the morning winds blow o'er the grove, —
It is to bid Love's roses bloom abundantly:
I'll tell thee why the night broods deep the earth above, —
Love's bridal tent to deck with sacred canopy:
All riddles of the earth dost thou desire to prove? —
To every earthly riddle is Love alone the key.

XV.

Life shrinks from Death in woe and fear,
Though Death ends well Life's bitter need:
So shrinks the heart when Love draws near,
As though 'twere Death in very deed:
For wheresoever Love finds room,
There Self, the sullen tyrant, dies.
So let him perish in the gloom, —
Thou to the dawn of freedom rise.

In this poetry, which soars over all that is external and sensuous, who would recognise the prosaic ideas current about so-called pantheism — ideas which let the divine sink to the external and the sensuous? The copious extracts which Tholuck, in his work *Anthology from the Eastern Mystics*, gives us from the poems of Jelaleddin and others, are made from the very point of view now under discussion. In his Introduction, Herr Tholuck proves how profoundly his soul has caught the note of mysticism; and there, too, he points out the characteristic traits of its oriental phase, in distinction from that of the West and Christendom. With all their divergence, however, they have in common the

mystical character. The conjunction of Mysticism with so-called Pantheism, as he says (p. 53), implies that inward quickening of soul and spirit which inevitably tends to annihilate that external *Everything*, which Pantheism is usually held to adore. But beyond that, Herr Tholuck leaves matters standing at the usual indistinct conception of Pantheism; a profounder discussion of it would have had, for the author's emotional Christianity, no direct interest; but we see that personally he is carried away by remarkable enthusiasm for a mysticism which, in the ordinary phrase, entirely deserves the epithet Pantheistic. Where, however, he tries philosophising (p. 12), he does not get beyond the standpoint of the "rationalist" metaphysic with its uncritical categories.

Elements of the Philosophy of Right

Translated by S. W. Dyde

First published in 1820, *Elements of the Philosophy of Right* is Hegel's most mature statement of his legal, moral, social and political philosophy, serving as an expansion upon concepts only briefly dealt with in the *Encyclopedia of the Philosophical Sciences*. The treatise opens with a discussion of the concept of the free will and argues that the free will can only realise itself in the complicated social context of property rights and relations, contracts, moral commitments, family life, the economy, the legal system and the polity. Hegel goes on to state that a person is not truly free unless he is a participant in all of these different aspects of the life of the state.

The majority of the text is devoted to discussing Hegel's three spheres of 'right,' each one larger than the preceding ones and encompassing them. The first sphere is abstract right, in which Hegel discusses the idea of 'non-interference' as a way of respecting others. He judges this insufficient and moves onto the second sphere, morality. In this section, Hegel proposes that humans reflect their own subjectivity of others in order to respect them. The third and final sphere, ethical life, is Hegel's integration of individual subjective feelings and universal notions of right. Under ethical life, Hegel launches into a lengthy discussion concerning family, civil society and the state.

Grundlinien

der

Philosophie des Rechts.

Von

D. Georg Wilhelm Friedrich Hegel,

Ordentl. Professor der Philosophie an der Königl. Universität
zu Berlin.

Berlin, 1821.
In der Nicolaischen Buchhandlung.

The first edition's title page

CONTENTS

Translator's Preface.

In his preface, Hegel's editor, Professor Eduard Gans, makes some interesting remarks upon the "Philosophy of Right," and informs us as to the way in which the matter of the book had been put together. He dates his preface May 29th, 1833, thirteen years, lacking one month, later than Hegel's date for the completion of his own preface, and eighteen months after the philosopher's death. Hegel had, it would appear, lived to see the outbreak of unusual opposition to his political conceptions, and so Dr. Gans begins: "The wide-spread misunderstanding, which prevents the recognition of the real value of the present work, and stands in the way of its general acceptance, urges me, now that an enlarged edition of it has been prepared, to touch upon some things, which I would rather have left simply to increasing philosophic insight." He goes on to give three reasons for placing great value upon this work of Hegel's.

1. He thinks that the highest praise is due to the author for the way in which he does justice to every side of the subject, even investigating questions which have only a slight bearing upon the matter in hand, and thus erecting a marvellously complete structure. This fact is more striking, thinks Dr. Gans, than the foundation of the work, which had been already in a measure laid by Kant and Rousseau.

2. A second achievement of the "Philosophy of Right" is the abolition of the distinction, so prominent in the seventeenth, and eighteenth centuries, between law and politics. Even in our own time, remarks the editor, many think of law as the skeleton, as it were, of the different forms of the state, as an abstract thing devoid of life and movement. Politics, again, they conceive to be more mobile and a function of a living thing. Law is thus

said to stand to politics as anatomy to physiology. This divergence, which was unknown to Plato and Aristotle, had its origin in the separatist character of the Middle Ages, and was brought to completion in the seventeenth and eighteenth centuries. Hegel, gathering up the experience of centuries, returns to the form of the ancient state, and counts law and politics as organic phases of one single whole.

3. The "Philosophy of Right" suggests a two-fold place for the principle of natural right. In its scientific treatment this principle precedes the philosophy of right, and it also comes at the close. That part of the "Encyclopaedia of the Philosophical Sciences," which precedes the discussion there given of right, morality, and the ethical system, is designated the subjective mind or spirit, and from that ground natural right proceeds. Skipping over the region occupied by the "Philosophy of Right," dealing with the objective spirit, natural right reappears in world history. Dr. Grans means that the right of the world-spirit, transcending, as it does, the individual and the nation, is a return at a higher level to natural right. Nations are, as he says, so many streams discharging themselves into the world-ocean of history. The three points of Professor Grans may be summarized thus: (1) Hegel is thorough and systematic; (2) He has so clear and penetrating a conception of his main idea that he is able to unify sciences, which had seemed to be mutually exclusive; (3.) A right of nature may be viewed as a phase of any stage of an expanding idea, and can be understood only by reference to the exact stage which the exposition has reached. Hence a right of nature, like subjectivity or objectivity, may mean quite different things at different points in the unfolding of the system. The single word here added is meant to accent what is implied in the third of these remarks. The "Philosophy of Right" is really only one part of a system. In the third part of his "Encyclopaedia," when he reaches the subject of Right, Hegel says (note to §487) that he may deal briefly with

this topic, since he has already gone exhaustively into it in his "Philosophy of Right." Hence as this work treats of an essential stage in the evolution of spirit, whose whole nature is unfolded scene by scene in the "Encyclopaedia," it is not accurate to speak of Hegel's ethical principles as based upon his logic. The more concrete categories of the "Philosophy of Right" are related each to the next in the same way as are the more abstract categories treated of in the logic. But the relation of the ethics to the logic is not that of superstructure to foundation or of application to principle, but of the more concrete to the less concrete stage of evolution. One single life runs through the whole organism of the work. Hence, Dr. Grans is not wrong in stating that this work is an essential part of Hegel's philosophy, and adding that with the entire system it must stand or fall. Rather, correcting the dramatic tone of the remark, he says in effect that standing and falling are not the only possibilities in the case of a great philosophy. Nor, again, can the different works of a genuine philosopher be separated into those that are gold and those that are alloy. His work as a whole becomes a common possession, and in that way makes ready, as Dr. Grans say, for a higher thought. The unqualified rejection of any part of a philosopher's work is a challenge to his claim to rank as a great thinker. But the only challenge which he could himself accept as genuine, is the one which is prepared to call in question the basis of his entire system. Perhaps in the "Philosophy of Right" the average philosophical worker comes more quickly to understand something of Hegel than in his other writings. At least Hegel in this book is more likely to collide directly with the reader's prepossessions, and therefore more speedily stimulates him to form his own view. No genuine philosopher will hesitate to show what form his principles assume in relation to tangible human interests. Hegel exhibits philosophic breadth by dressing up his ideas for the thoroughfare, w-here the every-day thinker finds it possible to hob and nob with the master. Yet the student

must be again cautioned not to fancy that, because he "feels sure" that Hegel's conception of the family, of the monarch, or of war is defective, he has left his author behind. Such a feeling is at best only a first step, and the student must go on to know how these practical ideas of Hegel are necessitated by his general conception of the process of spirit. And the sure feeling can survive only if it is transformed into a consistent criticism of this fundamental process. The stronghold of Hegel may not be impregnable, but it will not fall on a mere summons to surrender. The object of the translator is to let Hegel speak at large for himself. What liberties have been taken with the Hegelian vocabulary are illustrated by the index of words to be found at the close of this volume. It has been considered quite within the province of a translator to ameliorate Hegel's rigid phraseology. Even as it is the English would read more smoothly, had the words "the individual," "the subject," etc., been more frequently used instead of "particularity" and "subjectivity," but the substitution casts a different shade over Hegel's thought. Apart from the words, the reader of German will miss also Hegel's brackets and italics. As Dr. Gans has pointed out, the present work is in form made up of three elements, the paragraphs proper, the notes and the additions. The paragraphs comprised the entire book as it was originally issued. Then Hegel added what he in all his references to them calls Notes, although they are not expressly so designated in the German text. For the sake of simplicity this term has been used throughout the book. After these notes by Hegel are frequently found Additions made by students of Hegel from his oral lectures and comments. It is but bare justice to the editors to say that these additions usually cast a welcome light upon the text. Yet as they are mere additions, not even supervised by Hegel, it is no matter of surprise that the student, in beginning a new paragraph must, in order to get the direct connection, revert to the closing sentences not of the addition or mote but of the preceding paragraph. It ought to be some comfort to the

earnest reader to have in his hand all that Hegel on this subject thought to be worth saying. Mistakes the translator has no doubt made, and it would be for him fortunate if workers in this department were sufficiently interested in this translation to point them out.

S. W. Dyde.

March 23rd, 1896.

Author's Preface.

THE IMMEDIATE OCCASION for publishing these outlines is the need of placing in the hands of my hearers a guide to my professional lectures upon the Philosophy of Right. Hitherto I have used as lectures that portion of the "Encyclopaedia of the Philosophic Sciences" (Heidelberg, 1817,) which deals with this subject. The present work covers the same ground in a more detailed and systematic way. But now that these outlines are to be printed and given to the general public, there is an opportunity of explaining points which in lecturing would be commented on orally. Thus the notes are enlarged in order to include cognate or conflicting ideas, further consequences of the theory advocated, and the like. These expanded notes will, it is hoped, throw light upon the more abstract substance of the text, and present a more complete view of some of the ideas current in our own time. Moreover, there is also subjoined, as far as was compatible with the purpose of a compendium, a number of notes, ranging over a still greater latitude. A compendium proper, like a science, has its subject-matter accurately laid out. With the exception, possibly, of one or two slight additions, its chief task is to arrange the essential phases of its material. This material is regarded as fixed and known, just as the form is assumed to be governed by well-ascertained rules. A treatise in philosophy is usually not expected to be constructed on such a pattern, perhaps because people suppose that a philosophical product is a Penelope's web which must be started anew every day. This treatise differs from the ordinary compendium mainly in its method of procedure. It must be under-stood at the outset that the philosophic way of advancing from one matter to another, the general speculative method, which is the only kind of scientific proof available in

philosophy, is essentially different from every other. Only a clear insight into the necessity for this difference can snatch philosophy out of the ignominious condition into which it has fallen in our day. True, the logical rules, such as those of definition, classification, and inference are now generally recognized to be inadequate for speculative science. Perhaps it is nearer the mark to say that the inadequacy of the rules has been felt rather than recognized, because they have been counted as mere fetters, and thrown aside to make room for free speech from the heart, fancy and random intuition. But when reflection and relations of thought were required, people unconsciously fell back upon the old-fashioned method of inference and formal reasoning. In my "Science of Logic" I have developed the nature of speculative science in detail. Hence in this treatise an explanation of method will be added only here and there. In a work which is concrete, and presents such a diversity of phases, we may safely neglect to display at every turn the logical process, and may take for granted an acquaintance with the scientific procedure. Besides, it may readily be observed that the work as a whole, and also the construction of the parts, rest upon the logical spirit. From this standpoint, especially, is it that I would like this treatise to be understood and judged. In such a work as this we are dealing with a science, and in a science the matter must not be separated from the form. Some, who are thought to be taking a profound view, are heard to say that everything turns upon the subject-matter, and that the form may be ignored. The business of any writer, and especially of the philosopher, is, as they say to discover, utter, and diffuse truth and adequate conceptions. In actual practice this business usually consists in warming up and distributing on all sides the same old cabbage. Perhaps the result of this operation may be to fashion and arouse the feelings; though even this small merit may be regarded as superfluous, for "they have Moses and the prophets: let them hear them." Indeed, we have great cause to be amazed at

the pretentious tone of those who take this view. They seem to suppose that up till now the dissemination of truth throughout the world has been feeble. They think that the warmed-up cabbage contains new truths, especially to be laid to heart at the present time. And yet we see that what is on one side announced as true, is driven out and swept away by the same kind of worn-out truth. Out of this hurlyburly of opinions, that which is neither new nor old, but permanent, cannot be rescued and preserved except by science. Further, as to rights, ethical observances, and the state, the truth is as old as that in which it is openly displayed and recognized, namely, the law, morality, and religion. But as the thinking spirit is not satisfied with possessing the truth in this simple way, it must conceive it, and thus acquire a rational form for a content which is already rational implicitly. In this way the substance is justified before the bar of free thought. Free thought cannot be satisfied with what is given to it, whether by the external positive authority of the state or human agreement, or by the authority of internal feelings, the heart, and the witness of the spirit, which coincides unquestioningly with the heart. It is the nature of free thought rather to proceed out of its own self, and hence to demand that it should know itself as thoroughly one with truth. The ingenuous mind adheres with simple conviction to the truth which is publicly acknowledged. On this foundation it builds its conduct and way of life. In opposition to this naive view of things rises the supposed difficulty of detecting amidst the endless differences of opinion anything of universal application. This trouble may easily be supposed to spring from a spirit of earnest inquiry. But in point of fact those who pride themselves upon the existence of this obstacle are in the plight of him who cannot see the woods for the trees. The confusion is all of their own making. Nay, more: this confusion is an indication that they are in fact not seeking for what is universally valid in right and the ethical order. If they were at pains to find that out, and refused to busy themselves

with empty opinion and minute detail, they would adhere to and act in accordance with substantive right, namely the commands of the state and the claims of society. But a further difficulty lies in the fact that man thinks, and seeks freedom and a basis for conduct in thought. Divine as his right to act in this way is, it becomes a wrong, when it takes the place of thinking. Thought then regards itself as free only when it is conscious of being at variance with what is generally recognized, and of setting itself up as something original. The idea that freedom of thought and mind is indicated only by deviation from, or even hostility to what is everywhere recognized, is most persistent with regard to the state. The essential task of a philosophy of the state would thus seem to be the discovery and publication of a new and original theory. When we examine this idea and the way it is applied, we are almost led to think that no state or constitution has ever existed, or now exists. We are tempted to suppose that we must now begin and keep on beginning afresh for ever. We are to fancy that the founding of the social order has depended upon present devices and discoveries. As to nature, philosophy, it is admitted, has to understand it as it is. The philosophers' stone must be concealed somewhere, we say, in nature itself, as nature is in itself rational. Knowledge must, therefore, examine, apprehend and conceive the reason actually present in nature. Not with the superficial shapes and accidents of nature, but with its eternal harmony, that is to say, its inherent law and essence, knowledge has to cope. But the ethical world or the state, which is in fact reason potently and permanently actualized in self-consciousness, is not permitted to enjoy the happiness of being reason at all.1 On the contrary the spiritual universe is looked upon as abandoned by God, and given over as a prey to accident and chance. As in this way the divine is eliminated from the ethical world, truth must be sought outside of it. And since at the same time reason should and does belong to the ethical world, truth, being divorced from reason, is reduced to a mere speculation.

Thus seems to arise the necessity and duty of every thinker to pursue a career of his own. Not that he needs to seek for the philosophers' stone, since the philosophizing of our day has saved him the trouble, and every would-be thinker is convinced that he possesses the stone already without search. But these erratic pretensions are, as it indeed happens, ridiculed by all who, whether they are aware of it or not, are conditioned in their lives by the state and find their minds and wills satisfied in it. These, who include the majority if not all, regard the occupation of philosophers as a game, sometimes playful, sometimes earnest, sometimes entertaining, sometimes dangerous, but always as a mere game. Both this restless and frivolous reflection and also this treatment accorded to it might safely be left to take their own course, were it not that betwixt them philosophy is brought into discredit and contempt. The most cruel despite is done when every one is convinced of his ability to pass judgment upon, and discard philosophy without any special study. No such scorn is heaped upon any other art or science. In point of fact the pretentious utterances of recent philosophy regarding the state have been enough to justify any one who cared to meddle with the question, in the conviction that he could prove himself a philosopher by weaving a philosophy out of his own brain. Notwithstanding this conviction, that which passes for philosophy has openly announced that truth cannot be known. The truth with regard to ethical ideals, the state, the government and the constitution ascends, so it declares, out of each man's heart, feeling, and enthusiasm. Such declarations have been poured especially into the eager ears of the young. The words "God giveth truth to his chosen in sleep" have been applied to science; hence every sleeper has numbered himself amongst the chosen. But what he deals with in sleep is only the wares of sleep. Mr. Fries,2 one of the leaders of this shallow-minded host of philosophers, on a public festive occasion, now become celebrated, has not hesitated to give utterance to the following notion of the

state and constitution: “When a nation is ruled by a common spirit, then from below, out of the people, will come life sufficient for the discharge of all public business. Living associations, united indissolubly by the holy bond of friendship, will devote themselves to every side of national service, and every means for educating the people.” This is the last degree of shallowness, because in it science is looked upon as developing, not out of thought or conception, but out of direct perception and random fancy. Now the organic connection of the manifold branches of the social system is the architectonic of the state’s rationality, and in this supreme science of state architecture the strength of the whole is made to depend upon the harmony of all the clearly marked phases of public life, and the stability of every pillar, arch, and buttress of the social edifice. And yet the shallow doctrine, of which we have spoken, permits this elaborate structure to melt and lose itself in the brew and stew of the “heart, friendship, and inspiration.” Epicurus, it is said, believed that the world generally should be given over to each individual’s opinions and whims; and according to the view we are criticising the ethical fabric should be treated in the same way. By this old wives’ decoction, which consists in founding upon the feelings what has been for many centuries the labour of reason and understanding, we no longer need the guidance of any ruling conception of thought. On this point Goethe’s Mephistopheles, and the poet is a good authority, has a remark, which I have already used elsewhere —

“Verachte nur Verstand und Wissenschaft, des Mensclien allerhöchste Gaben — So hast dem Teufel dieh ergeben und musst zu Grunde gehn.”

It is no surprise that the view just criticised should appear in the form of piety. Where, indeed, has this whirlwind of impulse not sought to justify itself? In godliness and the Bible it has imagined itself able to find authority

for despising order and law. And, in fact, it is piety of a sort which has reduced the whole organized system of truth to elementary intuition and feeling. But piety of the right kind leaves this obscure region, and comes out into the daylight, where the idea unfolds and reveals itself. Out of its sanctuary it brings a reverence for the law and truth which are absolute and exalted above all subjective feeling. The particular kind of evil consciousness developed by the wishywashy eloquence already alluded to, may be detected in the following way. It is most unspiritual, when it speaks most of the spirit. It is the most dead and leathern, when it talks of the scope of life. When it is exhibiting the greatest self-seeking and vanity it has most on its tongue the words "people" and "nation." But its peculiar mark, found on its very forehead, is its hatred of law. Right and ethical principle, the actual world of right and ethical life, are apprehended in thought, and by thought are given definite, general, and rational form, and this reasoned right finds expression in law. But feeling, which seeks its own pleasure, and conscience, which finds right in private conviction, regard the law as their most bitter foe. The right, which takes the shape of law and duty, is by feeling looked upon as a shackle or dead cold letter. In this law it does not recognize itself and does not find itself free. Yet the law is the reason of the object, and refuses to feeling the privilege of warming itself at its private hearth. Hence the law, as we shall occasionally observe, is the Shibboleth, by means of which are detected the false brethren and friends of the so-called people. Inasmuch as the purest charlatanism has won the name of philosophy, and has succeeded in convincing the public that its practices are philosophy, it has now become almost a disgrace to speak in a philosophic way about the state. Nor can it be taken ill, if honest men become impatient, when the subject is broached. Still less is it a surprise that the government has at last turned its attention to this false philosophizing. With us philosophy is not practised as a private art, as it was by the Greeks, but has

a public place, and should therefore be employed only in the service of the state. The government has, up till now, shown such confidence in the scholars in this department as to leave the subject matter of philosophy wholly in their hands. Here and there, perhaps, has been shown to this science not confidence "so much as indifference, and professorships have been retained as a matter of tradition. In France, as far as I am aware, the professional teaching of metaphysics at least has fallen into desuetude. In any case the confidence of the state has been ill requited by the teachers of this subject. Or, if we prefer to see in the state not confidence, but indifference, the decay of fundamental knowledge must be looked upon as a severe penance. Indeed, shallowness is to all appearance most endurable and most in harmony with the maintenance of order and peace, when it does not touch or hint at any real issue. Hence it would not be necessary to bring it under public control, if the state did not require deeper teaching and insight, and expect science to satisfy the need. Yet this shallowness, notwithstanding its seeming innocence, does bear upon social life, right and duty generally, advancing principles which are the very essence of superficiality. These, as we have learned so decidedly from Plato, are the principles of the Sophists, according to which the basis of right is subjective aims and opinions, subjective feeling and private conviction. The result of such principles is quite as much the destruction of the ethical system, of the upright conscience, of love and right, in private persons, as of public order and the institutions of the state. The significance of these facts for the authorities will not be obscured by the claim that the holder of these perilous doctrines should be trusted, or by the immunity of office. The authorities will not be deterred by the demand that they should protect and give free play to a theory which strikes at the substantial basis of conduct, namely, universal principles; and that they should disregard insolence on the ground of its being the exercise of the teacher's function. To him, to

whom God gives office, He gives also understanding is a well-worn jest, which no one in our time would like to take seriously. In the methods of teaching philosophy, which have under the circumstances been reanimated by the government, the important element of protection and support cannot be ignored. The study of philosophy is in many ways in need of such assistance. Frequently in scientific, religious, and other works may be read a contempt for philosophy. Some, who have no conspicuous education and are total strangers to philosophy, treat it as a cast-off garment. They even rail against it, and regard as foolishness and sinful presumption its efforts to conceive of God and physical and spiritual nature. They scout its endeavour to know the truth. Reason, and again reason, and reason in endless iteration is by them accused, despised, condemned. Free expression, also, is given by a large number of those, who are supposed to be cultivating scientific research, to their annoyance at the unassailable claims of the conception. When we, I say, are confronted with such phenomena as these, we are tempted to harbour the thought that old traditions of tolerance have fallen out of use, and no longer assure to philosophy a place and public recognition.3 These presumptuous utterances, which are in vogue in our time, are, strange to say, in a measure justified by the shallowness of the current philosophy. Yet, on the other hand, they have sprung from the same root as that against which they so thanklessly direct their attacks. Since that self-named philosophizing has declared that to know the truth is vain, it has reduced all matter of thought to the same level, resembling in this way the despotism of the Roman Empire, which equalized noble and slave, virtue and vice, honour and dishonour, knowledge and ignorance. In such a view the conceptions of truth and the laws of ethical observance are simply opinions and subjective convictions, and the most criminal principles, provided only that they are convictions, are put on a level with these laws. Thus, too, any paltry special object, be it never so flimsy, is given the same

value as an interest common to all thinking men and the bonds of the established social world. Hence it is for science a piece of good fortune that that kind of philosophizing, which might, like scholasticism, have continued to spin its notions within itself, has been brought into contact with reality. Indeed, such contact was, as we have said, inevitable. The real world is in earnest with the principles of right and duty, and in the full light of a consciousness of these principles it lives. With this world of reality philosophic cob-web spinning has come into open rupture. Now, as to genuine philosophy it is precisely its attitude to reality which has been misapprehended. Philosophy is, as I have already observed, an inquisition into the rational, and therefore the apprehension of the real and present. Hence it cannot be the exposition of a world beyond, which is merely a castle in the air, having no existence except in the terror of a onesided and empty formalism of thought. In the following treatise I have remarked that even Plato's "Republic," now regarded as the byword for an empty ideal, has grasped the essential nature of the ethical observances of the Greeks He knew that there was breaking in upon Greek life a deeper principle, which could directly manifest itself only as an unsatisfied longing and therefore as ruin. Moved by the same longing Plato had to seek help against it but had to conceive of the help as coming down from above and hoped at last to have found it in an external special form of Greek ethical observance. He exhausted himself in contriving how by means of this new society to stem the tide of ruin, but succeeded only in injuring more fatally its deeper motive, the free infinite personality. Yet he has proved himself to be a great mind because the very principle and central distinguishing feature of his idea is the pivot upon which the world-wide revolution then in process turned:

What is rational is real;

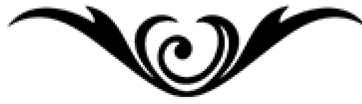
And what is real is rational.

Upon this conviction stand not philosophy only but even every unsophisticated consciousness. From it also proceeds the view now under contemplation that the spiritual universe is the natural. When reflection, feeling, or whatever other form the subjective consciousness may assume, regards the present as vanity, and thinks itself to be beyond it and wiser, it finds itself in emptiness, and, as it has actuality only in the present, it is vanity throughout. Against the doctrine that the idea is a mere idea, figment or opinion, philosophy preserves the more profound view that nothing is real except the idea. Hence arises the effort to recognize in the temporal and transient the substance, which is immanent, and the eternal, which is present. The rational is synonymous with the idea, because in realizing itself it passes into external existence. It thus appears in an endless wealth of forms, figures and phenomena. It wraps its kernel round with a robe of many colours, in which consciousness finds itself at home. Through this varied husk the conception first of all penetrates, in order to touch the pulse, and then feel it throbbing in its external manifestations. To bring to order the endlessly varied relations, which constitute the outer appearance of the rational essence is not the task of philosophy. Such material is not suitable for it, and it can well abstain from giving good advice about these things. Plato could refrain from recommending to the nurses not to stand still with children, but always to dandle them in their arms. So could Fichte forbear to construe, as they say, the supervision of passports to such a point as to demand of all suspects that not only a description of them but also their photograph, should be inserted in the pass. Philosophy now exhibits no trace of such details. These superfine concerns it may neglect all the more safely, since it shows itself of the most liberal spirit in its attitude towards the endless mass of objects and circumstances. By such a course science

will escape the hate which is visited upon a multitude of circumstances and institutions by the vanity of a better knowledge. In this hate bitterness of mind finds the greatest pleasure, as it can in no other way attain to a feeling of self-esteem. This treatise, in so far as it contains a political science, is nothing more than an attempt to conceive of and present the state as in itself rational. As a philosophic writing it must be on its guard against constructing a state as it ought to be. Philosophy cannot teach the state what it should be, but only how it, the ethical universe, is to be known.

Ιδοὺ Ῥόδος, ἰδοὺ καὶ τὸ πήδημα.
Hic Rhodus, *hic* saltus.

To apprehend what is is the task of philosophy, because what is is reason. As for the individual, every one is a son of his time; so philosophy also is its time apprehended in thoughts. It is just as foolish to fancy that any philosophy can transcend its present world, as that an individual could leap out of his time or jump over Rhodes. If a theory transgresses its time, and builds up a world as it ought to be, it has an existence merely in the unstable element of opinion, which gives room to every wandering fancy. With little change the above saying would read:



Here is the rose, here dance.

The barrier which stands between reason, as self-conscious spirit, and reason as present reality, and does not permit spirit to find satisfaction in reality, is some abstraction, which is not free to be conceived. To recognize reason as the rose in the cross of the present, and to find delight in it, is a rational insight which implies reconciliation with reality. This reconciliation philosophy grants to those who have felt the inward demand to conceive clearly, to preserve subjective freedom while present in substantive reality, and yet though possessing this freedom to stand not upon the particular and

contingent, but upon what is self originated and self-completed. This also is the more concrete meaning of what was a moment ago more abstractly called the unity of form and content. Form in its most concrete significance is reason, as an intellectual apprehension which conceives its object. Content, again, is reason as the substantive essence of social order and nature. The conscious identity of form and content is the philosophical idea. It is a self-assertion, which does honour to man, to recognize nothing in sentiment which is not justified by thought. This self-will is a feature of modern times, being indeed the peculiar principle of Protestantism. What was initiated by Luther as faith in feeling and the witness of the spirit, the more mature mind strives to apprehend in conception. In that way it seeks to free itself in the present, and so find there itself. It is a celebrated saying that a half philosophy leads away from God, while a true philosophy leads to God. (It is the same halfness, I say in passing, which regards knowledge as an approximation to truth.) This saying is applicable to the science of the state. Reason cannot content itself with a mere approximation, something which is neither cold not hot, and must be spued out of the mouth. As little can it be contented with the cold scepticism that in this world of time things go badly, or at best only moderately well, and that we must keep the peace with reality, merely because there is nothing better to be had. Knowledge creates a much more vital peace. Only one word more concerning the desire to teach the world what it ought to be. For such a purpose philosophy at least always comes too late. Philosophy, as the thought of the world, does not appear until reality has completed its formative process, and made itself ready. History thus corroborates the teaching of the conception that only in the maturity of reality does the ideal appear as counterpart to the real, apprehends the real world in its substance, and shapes it into an intellectual kingdom. When philosophy paints its grey in grey, one form of life has become old, and by means of grey it cannot be rejuvenated, but only

known. The owl of Minerva takes its flight only when the shades of night are gathering. But it is time to close this preface. As a preface it is its place to speak only externally and subjectively of the standpoint of the work which it introduces. A philosophical account of the essential content needs a scientific and objective treatment. So, too, criticisms, other than those which proceed from such a treatment, must be viewed by the author as unreflective convictions. Such subjective criticisms must be for him a matter of indifference. Berlin, June 25th, 1820.

Introduction.

1. THE PHILOSOPHIC science of right has as its object the idea of right, i.e., the conception of right and the realization of the conception. Note. Philosophy has to do with ideas or realized thoughts, and hence not with what we have been accustomed to call mere conceptions. It has indeed to exhibit the onesidedness and untruth of these mere conceptions, and to show that, while that which commonly bears the name "conception," is only an abstract product of the understanding, the true conception alone has reality and gives this reality to itself. Everything, other than the reality which is established "by the conception, is transient surface existence, external accident, opinion, appearance void of essence, untruth, delusion, and so forth. Through the actual shape, which it takes upon itself in actuality, is the conception itself understood. This shape is the other essential element of the idea, and is to be distinguished from the form, which exists only as conception. Addition. The conception and its existence are two sides, distinct yet united, like soul and body. The body is the same life as the soul, and yet the two can be named independently. A soul without a body would not be a living thing, and vice versa. Thus the visible existence of the conception is its body, just as the body obeys the soul which produced it. Seeds contain the tree and its whole power, though they are not the tree itself; the tree corresponds accurately to the simple structure of the seed. If the body does not correspond to the soul, it is defective. The unity of visible existence and conception, of body and soul, is the idea. It is not a mere harmony of the two, but their complete interpenetration. There lives nothing, which is not in some way idea. The idea of right is freedom,

which, if it is to be apprehended truly, must be known both in its conception and in the embodiment of the conception.

2. The science of right is a part of philosophy. Hence it must develop the idea, which is the reason of an object, out of the conception. It is the same thing to say that it must regard the peculiar internal development of the thing itself. Since it is a part it has a definite beginning, which is the result and truth of what goes before, and this, that goes before, constitutes its so-called proof. Hence the origin of the conception of right falls outside of the science of right. The deduction of the conception is presupposed in this treatise, and is to be considered as already given. Addition. Philosophy forms a circle. It has, since it must somehow make a beginning, a primary, directly given matter, which is not proved and is not a result. But this starting-point is simply relative, since from another point of view it appears as a result. Philosophy is a consequence, which does not hang in the air or form a directly new beginning, but is self- enclosed. According to the formal unphilosophic method of the sciences, definition is the first desideratum, as regards, at least, the external scientific form. The positive science of right, however, is little concerned with definition, since its special aim is to give what it is that is right, and also the particular phases of the laws. For this reason it has been said as a warning, Omnis definitio in jure civili periculosa; and in fact the more disconnected and contradictory the phases of a right are, the less possible is a definition of it. A definition should contain only universal features; but these forthwith bring to light contradictions, which in the case of law are injustice, in all their nakedness. Thus in Roman law, for instance, no definition of man was possible, because it excluded the slave. The conception of man was destroyed by the fact of slavery. In the same way to have defined property and owner would have appeared to be perilous to many relations. But definitions may perhaps be derived from etymology, for the reason, principally, that in this way

special cases are avoided, and a basis is found in the feeling and imaginative thought of men. The correctness of a definition would thus consist in its agreement with existing ideas. By such a method everything essentially scientific is cast aside. As regards the content there is cast aside the necessity of the self-contained and self-developed object, and as regards the form there is discarded the nature of the conception. In philosophic knowledge the necessity of a conception is the main thing, and the process, by which it, as a result, has come into being, is the proof and deduction. After the content is seen to be necessary independently, the second point is to look about for that which corresponds to it in existing ideas and modes of speech. But the way in which a conception exists in its truth, and the way it presents itself in random ideas not only are but must be different both in form and structure. If a notion is not in its content false, the conception can be shown to be contained in it and to be already there in its essential traits. A notion may thus be raised to the form of a conception. But so little is any notion the measure and criterion of an independently necessary and true conception, that it must accept truth from the conception, be justified by it, and know itself through it. If the method of knowing, which proceeds by formal definition, inference and proof, has more or less disappeared, a worse one has come to take its place. This new method maintains that ideas, as, e.g., the idea of right in all its aspects, are to be directly apprehended as mere facts of consciousness, and that natural feeling, or that heightened form of it which is known as the inspiration of one's own breast, is the source of right. This method may be the most convenient of all, but it is also the most unphilosophic. Other features of this view, referring not merely to knowledge but directly to action, need not detain us here. While the first or formal method went so far as to require in definition the form of the conception, and in proof the form of a necessity of knowledge, the method of the intuitive consciousness and feeling takes for its principle the arbitrary

contingent consciousness of the subject. In this treatise we take for granted the scientific procedure of philosophy, which has been set forth in the philosophic logic.

3. Right is positive in general (a) in its form, since it has validity in a state; and this established authority is the principle for the knowledge of right. Hence we have the positive science of right. (b) On the side of content this right receives a positive element (a) through the particular character of a nation, the stage of its historical development, and the interconnection of all the relations which are necessitated by nature: (b) through the necessity that a system of legalized right must contain the application of the universal conception to objects and cases whose qualities are given externally. Such an application is not the speculative thought or the development of the conception, but a subsumption made by the understanding: (g) through the ultimate nature of a decision which has become a reality. Note. Philosophy at least cannot recognize the authority of feeling, inclination and caprice, when they are set in opposition to positive right and the laws. It is an accident, external to the nature of positiveright, when force or tyranny becomes an element of it. It will be shown later (§§211–214), at what point right must become positive. The general phases which are there deduced, are here only mentioned, in order to indicate the limit of philosophic right, and also to forestall the idea or indeed the demand that by a systematic development of right should be produced a law-book, such as would be needed by an actual state. — To convert the differences between right of nature and positive right, or those between philosophic right and positive right, into open antagonism would be a complete misunderstanding. Natural right or philosophic right stands to positive right as institutions to pandects. With regard to the historical element in positive right, referred to in the paragraph, it may be said that the true historical view and genuine philosophic standpoint have been presented by Montesquieu. He regards legislation and its specific traits not in an isolated and abstract way, but rather as a dependent element of one totality, connecting it with all the other elements which form the character of a nation and an epoch. In this

interrelation the various elements receive their meaning and justification. The purely historical treatment of the phases of right, as they develop in time, and a comparison of their results with existing relations of right have their own value; but they are out of place in a philosophic treatise, except in so far as the development out of historic grounds coincides with the development out of the conception, and the historical exposition and justification can be made to cover a justification which is valid in itself and independently. This distinction is as manifest as it is weighty. A phase of right may be shown to rest upon and follow from the circumstances and existing institutions of right, and yet may be absolutely unreasonable and void of right. This is the cape in Roman law with many aspects of private right, which were the logical results of its interpretation of paternal power and of marriage. Further, if the aspects of right are really right and reasonable, it is one thing to point out what with regard to them can truly take place through the conception, and quite another thing, to portray the manner of their appearance in history, along with the circumstances, cases, wants and events, which they have called forth Such a demonstration and deduction from nearer or more remote historic causes, which is the occupation of pragmatic history, is frequently called exposition, or preferably conception, under the opinion that in such an indication of the historic elements is found all that is essential to a conception of law and institutions of right. In point of fact that which is truly essential, the conception of the matter has not been so much as mentioned. So also we are accustomed to hear of Roman or German conceptions of right, and of conceptions of right as they are laid down in this or that statute-book, when indeed nothing about conceptions can be found in them, but only general phases of right, propositions derived from the understanding, general maxims, and laws. By neglect of the distinction, just alluded to, the true standpoint is obscured and the question of a valid justification is shifted into

a justification based upon circumstances; results are founded on presuppositions, which in themselves are of little value; and in general the relative is put in place of the absolute, and external appearance in place of the nature of the thing. When the historical vindication substitutes the external origin for the origin from the conception, it unconsciously does the opposite of what it intends. Suppose that an institution, originating under definite circumstances, is shown to be necessary and to answer its purpose, and that it accomplishes all that is required of it by the historical standpoint. When such a proof is made to stand for a justification of the thing itself, it follows that, when the circumstances are removed, the institution has lost its meaning and its right. When, e.g., it is sought to support and defend cloisters on the grounds that they have served to clear and people the wilderness and by teaching and transcribing to preserve scholarship, it follows that just in so far as the circumstances are changed, cloisters have become aimless and superfluous. In so far as the historic significance, or the historical exposition and interpretation of the origin of anything is in different spheres at home with the philosophic view of the origin and conception of the thing, one might tolerate the other. But, in illustration of the fact that they neither here nor in science, preserve this peaceful attitude, I quote from Mr. Hugo's "Lehrbuch der Geschichte des römischen Rechts."4 In this work Mr Hugo says (5th edition §53) that "Cicero praises the twelve tables with a side glance at philosophy," "but the philosopher Phavorinus treats them exactly as many a great philosopher since has treated positive right." Mr. Hugo makes the ultimate reply to such a method as that of Phavorinus, when he says of him that he "understood the twelve tables just as little as the philosophers understood positive right." — The correction of the philosopher Phavorinus by the jurist Sextus Caecilius (Gellius. "Noct. Attic." xx. 1) expresses the lasting and true principle of the justification of that which is in its content merely positive "Non ignoras," as

Caecilius felicitously remarks to Phavorinus, “legum opportunitates et medelas pro tem-porum moribus, et pro rerum publicarum generibus, ac pro utilitatum praesentium rationibus, proque vitiorum, quibus medendum est, fervoribus mutari ac flecti, neque uno statu consistere, quin, ut facies coeli et maris, ita rerum atque fortunae tempestatibus varientur. Quid salubrius visum est rogatione illa Stolonis, etc., quid utilius plebiscite Voconio, etc., quid tam necessarium existimatum est, quam lex Licinia, etc.? Omnia tamen haec obliterata et operta sunt civitatis opulentia,” etc. These laws are positive so far as they have meaning and appropriateness under the circumstances, and thus have only an historic value. For this reason they are in their nature transient, Whether the legislator or government was wise or not in what it did for its own immediate time and circumstances is a matter quite by itself and is for history to say. History will the more profoundly recognize the action of the legislator in proportion as its estimate receives support from the philosophic standpoint. From the vindications of the twelve tables against the judgment of Phavorinus I shall give further examples, because in them Caecilius furnishes an illustration of the fraud which is indissolubly bound up with the methods of the understanding and its reasonings. He adduces a good reason for a bad thing, and supposes that he has in that way justified the thing. Take the horrible law which permitted a creditor, after the lapse of a fixed term of respite, to kill a debtor or sell him into slavery. Nay, further, if there were several creditors, they were permitted to cut pieces off the debtor, and thus divide him amongst them, with the proviso that if any one of them should cut off too much or too little, no action should be taken against him. It was this clause, it may be noticed, which stood Shakespeare’s Shylock in “The Merchant of Venice” in such good stead, and was by him most thankfully accepted. Well, for this law Caecilius adduces the good argument that by it trust and credit were more firmly secured, and also that, by reason of the very horror of the law,

it never had to be enforced. Not only does he in his want of thought fail to observe that by the severity of the law that very intention of securing trust and credit was defeated, but he forthwith himself gives an illustration of the way in which the disproportionate punishment caused the law to be inoperative, namely through the habit of giving false witness. But the remark of Mr. Hugo that Phavorinus had not understood the law is not to be passed over. Now any school-boy can understand the law just quoted, and better than anyone else would Shylock have understood what was to him of such advantage. Hence, by "understand" Mr. Hugo must mean that form of understanding which consists in bringing to the support of a law a good reason. Another failure to understand, asserted by Caecilius of Phavorinus, a philosopher at any rate may without blushing acknowledge: jumentum, which without any arcera was the only legal way to bring a sick man to court as a witness, was held to mean not only a horse but also a carriage or wagon. Further on in this law Caecilius found more evidence of the excellence and accuracy of the old statutes, which for the purpose of non-suiting a sick man at court distinguished not only between a horse and a wagon, but also, as Caecilius explains, between a wagon covered and cushioned and one not so comfortably equipped. Thus one would have the choice between utter severity on one side, and on the other senseless details. But to exhibit fully the absurdity of these laws and the pedantic defence offered in their behalf would give rise to an invincible repugnance to all scholarship of that kind. But in his manual Mr. Hugo speaks also of rationality in connection with Roman law, and I have been struck with the following remarks. He first of all treats of the epoch extending from the origin of the Republic to the twelve tables (§§38, 39), noticing that in Rome people had many wants, and were compelled in their labour to use draught animals and beasts of burden, as we ourselves do, and that the ground was an alternation of hill and valley, and that the city was set upon a hill, etc.

These statements might, perhaps, have answered to the sense of Montesquieu's thought, though in them it would be well-nigh impossible to find his genius. But after these preliminary paragraphs, he goes on to say in §40, that the condition of the law was still very far from satisfying the highest demands of reason. This remark is wholly in place, as the Roman family-right, slavery, etc., give no satisfaction to the smallest demands of reason. Yet when discussing the succeeding epochs, Mr. Hugo forgets to tell us in what particulars, if any, the Roman law has satisfactorily met the highest demands of reason. Still of the classic jurists, who flourished in the era of the greatest expansion of Roman law as a science, it is said (§289) that "it has been long since been observed that the Roman jurists were educated in philosophy," but "few know" (more will know now through the numerous editions of Mr. Hugo's manual) "that there is no class of writers, who, as regards deduction from principles, deserved to be placed beside the mathematicians, and also, as regards the quite remarkable way in which they develop their conceptions, beside the modern founder of meta-physic; as voucher for this assertion is the notable fact that nowhere do so many trichotomies occur as in the classic jurists and in Kant." This form of logical reasoning,extolled by Leibnitz, is certainly an essential feature of the science of right, as it is of mathematics and every other intelligible science; but the logical procedure of the mere understanding, spoken of by Mr. Hugo, has nothing to do with the satisfaction of the claims of reason and with philosophic science. Moreover, the very lack of logical procedure, which is characteristic of the Roman jurists and praetors, is to be esteemed as one of their chief virtues, since by means of it they obviated the consequences of unrighteous and horrible institutions. Through their want of logic they were compelled callide to put sense into mere verbal distinctions, as they did when they identified Bonorum possessio with inheritance, and also into silly evasions, for silliness is a defect of logic, in

order to save the letter of the tables, as was done in the fictio or ὑπόκρισις that a filia patroni was a filius (Heinecc. "Antiq-Rom.," lib. i. tit. ii. §24). But it is absurd to place the classic jurists, with their use of trichotomy, along with Kant, and in that way to discern in them the promise of the development of conceptions.

4. The territory of right is in general the spiritual, and its more definite place and origin is the will, which is free. Thus freedom constitutes the substance and essential character of the will, and the system of right is the kingdom of actualized freedom. It is the world of spirit which is produced out of itself, and is a second nature. Addition. — Freedom of will is best explained by reference to physical nature. Freedom is a fundamental phase of will, as weight is of bodies. When it is said that matter is heavy, it might be meant that the predicate is an accident; but such is not the case, for in matter there is nothing which has not weight; in fact, matter is weight. That which is heavy constitutes the body, and is the body. Just so is it with freedom and the will; that which is free is the will. Will without freedom is an empty word, and freedom becomes actual only as will, as subject. A remark may also be made as to the connection of willing and thinking. Spirit, in general, is thought, and by thought man is distinguished from the animal. But we must not imagine that man is on one side thinking and on another side willing, as though he had will in one pocket and thought in another. Such an idea is vain. The distinction between thought and will is only that between a theoretical and a practical relation. They are not two separate faculties. The will is a special way of thinking; it is thought translating itself into reality; it is the impulse of thought to give itself reality. The distinction between thought and will may be expressed in this way. When I think an object, I make of it a thought, and take from it the sensible. Thus I make of it something which is essentially and directly mine. Only in thought am I self-contained. Conception is the penetration of

the object, which is then no longer opposed to me. From it I have taken its own peculiar nature, which it had as an independent object in opposition to me. As Adam said to Eve, "thou art flesh of my flesh and bone of my bone," so says the spirit, "This object is spirit of my spirit, and all alienation has disappeared." Any idea is a universalizing, and this process belongs to thinking. To make something universal is to think. The "I" is thought and the universal. When I say "I," I let fall all particularity of character, natural endowment, knowledge, age. The I is empty, a point and simple, but in its simplicity active. The gaily coloured world is before me; I stand opposed to it, and in this relation I cancel and transcend the opposition, and make the content my own. The I is at home in the world, when it knows it, and still more when it has conceived it. So much for the theoretical relation. The practical, on the other hand, begins with thinking, with the I itself. It thus appears first of all as placed in opposition, because it exhibits, as it were, a separation. As I am practical, I am active; I act and determine myself; and to determine myself means to set up a distinction. But these distinctions are again mine, my own determinations come to me; and the ends are mine, to which I am impelled. Even when I let these distinctions and determinations go, setting them in the so-called external world, they remain mine. They are that which I have done and made, and bear the trace of my spirit. That is the distinction to be drawn between the theoretical and the practical relations. And now the connection of the two must be also stated. The theoretical is essentially contained in the practical. Against the idea that the two are separate runs the fact that man has no will without intelligence. The will holds within itself the theoretical, the will determines itself, and this determination is in the first instance internal. That which I will I place before my mind, and it is an object for me. The animal acts according to instinct, is impelled by something internal, and so is also practical. But it has no will, because it cannot place before its mind what it desires.

Similarly man cannot use his theoretic faculty or think without will, for in thinking we are active. The content of what is thought receives, indeed, the form of something existing, but this existence is occasioned by our activity and by it established. These distinctions of theoretical and practical are inseparable; they are one and the same; and in every activity, whether of thought or will, both these elements are found. It is worth while to recall the older way of proceeding with regard to the freedom of the will. First of all, the idea of the will was assumed, and then an effort was made to deduce from it and establish a definition of the will. Next, the method of the older empirical psychology was adopted, and different perceptions and general phenomena of the ordinary consciousness were collected, such as remorse, guilt, and the like, on the ground that these could be explained only as proceeding out of a will that is free. Then from these phenomena was deduced the so-called proof that the will is free. But it is more convenient to take a short cut and hold that freedom is given as a fact of consciousness, and must be believed in. The nature of the will and of freedom, and the proof that the will is free, can be shown, as has already been observed (§2), only in connection with the whole. The ground principles of the premises — that spirit is in the first instance intelligence, and that the phases, through which it passes in its development, namely from feeling, through imaginative thinking to thought, are the way by which it produces itself as will, which, in turn, as the practical spirit in general, is the most direct truth of intelligence — I have presented in my “Encyclopaedia of the Philosophical Sciences” (Heidelberg, 1817), and hope some day to be able to give of them a more complete exposition. There is, to my mind, so much the more need for me to give my contribution to, as I hope, the more thorough knowledge of the nature of spirit, since, as I have there said, it would be difficult to find a philosophic science in a more neglected and evil plight than is that theory of spirit, which is commonly called psychology.

Some elements of the conception of will, resulting from the premises enumerated above are mentioned in this and the following paragraphs. As to these, appeal may moreover be made to every individual to see them in his own self-consciousness. Everyone will, in the first place, find in himself the ability to abstract himself from all that he is, and in this way prove himself able of himself to set every content within himself, and thus have in his own consciousness an illustration of all the subsequent phases.

5. The will contains (a) the element of pure indeterminateness, i.e., the pure doubling of the I back in thought upon itself. In this process every limit or content, present though it be directly by way of nature, as in want, appetite or impulse, or given in any specific way, is dissolved. Thus we have the limitless infinitude of absolute abstraction, or universality, the pure thought of itself. Note. Those who treat thinking and willing as two special, peculiar, and separate faculties, and, further, look upon thought as detrimental to the will, especially the good will, show from the very start that they know nothing of the nature of willing — a remark which we shall be called upon to make a number of times upon the same attitude of mind. The will on one side is the possibility of abstraction from every aspect in which the I finds itself or has set itself up. It reckons any content as a limit, and flees from it. This is one of the forms of the self-direction of the will, and is by imaginative thinking insisted upon as of itself freedom. It is the negative side of the will, or freedom as apprehended by the understanding. This freedom is that of the void, which has taken actual shape, and is stirred to passion. It, while remaining purely theoretical, appears in Hindu religion as the fanaticism of pure contemplation; but becoming actual it assumes both in politics and religion the form of a fanaticism, which would destroy the established social order, remove all individuals suspected of desiring any kind of order, and demolish any organization which then sought to rise out of the ruins Only in devastation does the negative will feel that it has

reality. It intends, indeed, to bring to pass some positive social condition, such as universal equality or universal religious life. But in fact it does not will the positive reality of any such condition, since that would carry in its train a system, and introduce a separation by way of institutions and between individuals. But classification and objective system attain self consciousness only by destroying negative freedom. Negative freedom is actuated by a mere solitary abstract idea, whose realization is nothing but the fury of desolation. Addition. This phase of will implies that I break loose from everything, give up all ends, and bury myself in abstraction. It is man alone who can let go everything, even life. He can commit suicide, an act impossible for the animal, which always remains only negative, abiding in a state foreign to itself, to which it must merely get accustomed. Man is pure thought of himself, and only in thinking has he the power to give himself universality and to extinguish in himself all that is particular and definite. Negative freedom, or freedom of the understanding, is onesided, yet as this one-sidedness contains an essential feature, it is not to be discarded. But the defect of the understanding is that it exalts its onesidedness to the sole and highest place. This form of freedom frequently occurs in history. By the Hindus, e.g., the highest freedom is declared to be persistence in the consciousness of one's simple identity with himself, to abide in the empty space of one's own inner being, like the colourless light of pure intuition, and to renounce every activity of life, every purpose and every idea. In this way man becomes Brahma; there is no longer any distinction between finite man and Brahma, every difference having been swallowed up in this universality. A more concrete manifestation of this freedom is the fanaticism of political and religious life. Of this nature was the terrible epoch of the French Revolution, by which all distinctions in talent and authority were to have been superseded. In this time of upheaval and commotion any specific thing was intolerable. Fanaticism wills an

abstraction and not an articulate association. It finds all distinctions antagonistic to its indefiniteness, and supersedes them. Hence in the French Revolution the people abolished the institutions which they themselves had set up, since every institution is inimical to the abstract self-consciousness of equality.

6. (b) The I is also the transition from blank indefiniteness to the distinct and definite establishment of a definite content and object, whether this content be given by nature or produced out of the conception of spirit. Through this establishment of itself as a definite thing the I becomes a reality. This is the absolute element of the finitude or specialization of the I. Note. This second element in the characterization of the I is just as negative as the first, since it annuls and replaces the first abstract negativity. As the particular is contained in the universal, so this second phase is contained already in the first, and is only an establishing of what the first is implicitly. The first phase, if taken independently, is not the true infinitude, i.e., the concrete universal, or the conception, but limited and one-sided. In that it is the abstraction from all definite character, it has a definite character. Its abstract and one-sided nature constitutes its definite character, its defect and finitude. The distinct characterization of these two phases of the I is found in the philosophy of Fichte as also in that of Kant. Only, in the exposition of Fichte the I, when taken as unlimited, as it is in the first proposition of his "Wissenschaftslehre," is merely positive. It is the universally and identity made by the understanding. Hence this abstract I is in its independence to be taken as the truth, to which by way of mere addition comes in the second proposition, the limitation, or the negative in general, whether it be in the form of a given external limit or of an activity of the I. To apprehend the negative as immanent in the universal or self-identical, and also as in the I, was the next step, which speculative philosophy had to make. Of this want they have no presentiment, who like Fichte never apprehend that the infinite

and finite are, if separated, abstract, and must be seen as immanent one in the other. Addition. This second element makes its appearance as the opposite of the first; it is to be understood in its general form: it belongs to freedom but does not constitute the whole of it. Here the I passes over from blank in-determinateness to the distinct establishment of a specific character as a content or object. I do not will merely, but I will something. Such a will, as is analysed in the preceding paragraph, wills only the abstract universal, and therefore wills nothing. Hence it is not a will. The particular thing, which the will wills is a limitation, since the will, in order to be a will, must in general limit itself. Limit or negation consists in the will willing something. Particularizing is thus as a rule named finitude. Ordinary reflection holds the first element, that of the indefinite, for the absolute and higher, and the limited for a mere negation of this indefiniteness. But this indefiniteness is itself only a negation, in contrast with the definite and finite. The I is solitude and absolute negation. The indefinite will is thus quite as much one-sided as the will, which continues merely in the definite.

7. (g) The will is the unity of these two elements. It is particularity turned back within itself and thus led back to universality; it is individuality; it is the self-direction of the I. Thus at one and the same time it establishes itself as its own negation, that is to say, as definite and limited, and it also abides by itself, in its self-identity and universality, and in this position remains purely self-enclosed. The I determines itself in so far as it is the reference of negativity to itself; and yet in this self reference it is indifferent to its own definite character. This it knows as its own, that is, as an ideal or a mere possibility, by which it is not bound, but rather exists in it merely because it establishes itself there. This is the freedom of the will, constituting its conception or substantive reality. It is its gravity, as it were, just as gravity is the substantive reality of a body. Note. Every self-consciousness knows itself as at once universal, or the possibility of

abstracting itself from everything definite, and as particular, with a fixed object, content or aim. These two elements, however, are only abstractions. The concrete and true, — and all that is true is concrete, — is the universality, to which the particular is at first opposed, but, when it has been turned back into itself, is in the end made equal. This unity is individuality, but it is not a simple unit as is the individuality of imaginative thought, but a unit in terms of the conception ("Encyclopaedia of the Philosophical Sciences," §§112–114). In other words, this individuality is properly nothing else than the conception. The first two elements of the will, that it can abstract itself from everything, and that it is definite through either its own activity or something else, are easily admitted and comprehended, because in their separation they are untrue, and characteristic of the mere understanding. But into the third, the true and speculative — and all truth, as far as it is conceived, must be thought speculatively — the understanding declines to venture, always calling the conception the inconceivable. The proof and more detailed explanation of this inmost reserve of speculation, of infinitude as the negativity which refers itself to itself, and of this ultimate source of all activity, life and consciousness, belong to logic, as the purely speculative philosophy. Here it can be noticed only in passing that, in the sentences, "The will is universal," "The will directs itself," the will is already regarded as presupposed subject or substratum; but it is not something finished and universal before it determines itself, nor yet before this determination is superseded and idealized. It is will only when its activity is self-occasioned, and it has returned into itself. Addition. What we properly call will contains the two above-mentioned elements. The I is, first of all, as such, pure activity, the universal which is by itself. Next this universal determines itself, and so far is no longer by itself, but establishes itself as another, and ceases to be the universal. The third step is that the will, while in this limitation, i.e., in this other, is by itself. While it limits

itself, it yet remains with itself, and does not lose its hold of the universal. This is, then, the concrete conception of freedom, while the other two elements have been thoroughly abstract and one-sided. But this concrete freedom we already have in the form of perception, as in friendship and love. Here a man is not onesided, but limits himself willingly in reference to another, and yet in this limitation knows himself as himself. In this determination he does not feel himself determined, but in the contemplation of the other as another has the feeling of himself. Freedom also lies neither in indeterminateness nor in determinateness, but in both. The wilful man has a will which limits itself wholly to a particular object, and if he has not this will, he supposes himself not to be free. But the will is not bound to a particular object, but must go further, for the nature of the will is not to be one-sided and confined. Free will consists in willing a definite object, but in so doing to be by itself and to return again into the universal.

8. If we define this particularizing (b §6) further, we reach a distinction in the forms of the will, (a) In so far as the definite character of the will consists in the formal opposition of the subjective to the objective or external direct existence, we have the formal will as a self consciousness; which finds an outer world before it. The process by which individuality turns back in its definiteness into itself, is the translation of the subjective end, through the intervention of an activity and a means, into objectivity. In the absolute spirit, in which all definite character is thoroughly its own and true (“Encyclop.” §363), consciousness is only one side, namely, the manifestation or appearance of the will, a phase which does not require detailed consideration here. Addition. The consideration of the definite nature of the will belongs to the understanding, and is not in the first instance speculative. The will as a whole, not only in the sense of its content, but also in the sense of its form, is determined. Determinate character on the side of form is the end, and the execution of the end. The

end is at first merely something internal to me and subjective, but it is to be also objective and to cast away the defect of mere subjectivity. It may be asked, why it has this defect. When that which is deficient does not at the same time transcend its defect, the defect is for it not a defect at all. The animal is to us defective, but not for itself. The end, in so far as it is at first merely ours, is for us a defect, since freedom and will are for us the unity of subjective and objective. The end must also be established as objective; but does not in that way attain a new one-sided character, but rather its realization. 9 (b). In so far as the definite phases of will are its own peculiar property or its particularization turned back into itself, they are content. This content, as content of the will, is for it, by virtue of the form given in (a), an end, which exists on its inner or subjective side as the imaginative will, but by the operation of the activity, which converts the subjective into the objective, it is realized, completed end.

10. The content or determinate phase of will is in the first instance direct or immediate. Then the will is free only in itself or for us, i.e., it is the will in its conception. Only when it has itself as an object is it also for itself, and its implicit freedom becomes realized. Note. At this standpoint the finite implies that whatever is in itself, or according to its conception, has an existence or manifestation different from what it is for itself. For example the abstract separateness of nature is in itself space, but for itself time. Here, two things are to be observed, (1) that because the truth is the idea, when any object or phase is apprehended only as it is in itself or in conception, it is not as yet apprehended in its truth, and yet (2) that, whatever exists as conception or in itself, at the same time exists, and this existence is a peculiar form of the object, as e.g. space. The separation of existence-in-itself or implicit existence from existence-for-itself or explicit existence is a characteristic of the finite, and constitutes its appearance or merely external reality. An example of this is to hand in the separation of the natural will

from formal right. The understanding adheres to mere implicit existence, and in accordance with this position calls freedom a capacity, since it is at this point only a possibility. But the understanding regards this phase as absolute and perennial, and considers the relation of the will to what it wills or reality as an application to a given material, which does not belong to the essence of freedom. In this way the understanding occupies itself with mere abstractions, and not with the idea and truth. Addition. The will, which is will only according to the conception, is free implicitly, but is at the same time not free. To be truly free, it must have a truly fixed content; then it is explicitly free, has freedom for its object, and is freedom. What is at first merely in conception, i.e., implicit, is only direct and natural, We are familiar with this in pictorial thought also. The child is implicitly a man, at first has reason implicitly, and is at first the possibility of reason and freedom. He is thus free merely according to the conception. That which is only implicit does not yet exist in actuality. A man, who is implicitly rational, must create himself by working through and out of himself and by reconstructing himself within himself, before he can become also explicitly rational.

11. The will, which is at first only implicitly free, is the direct or natural will. The distinctive phases, which the self-determining conception sets up in the will, appear in the direct will, as a directly present content. They are impulses, appetites, inclinations, by which the will finds itself determined by nature. Now this content, with all its attendant phases, proceeds from the rationality of the will, and is therefore implicitly rational; but let loose in its immediate directness it has not as yet the form of rationality. The content is indeed for me and my own, but the form and the content are yet different. The will is thus in itself finite. Note. Empirical psychology enumerates and describes these impulses and inclinations, and the wants which are based upon them. It takes, or imagines that it takes this material from experience,

and then seeks to classify it in the usual way. It will be stated below, what the objective side of impulse is, and what impulse is in its truth, apart from the form of irrationality which it has as an impulse, and also what shape it assumes when it reaches existence. Addition. Impulse, appetite, inclination are possessed by the animal also, but it has not will; it must obey impulse, if there is no external obstacle. Man, however, is the completely undetermined, and stands above impulse, and may fix and set it up as his. Impulse is in nature, but it depends on my will whether I establish it in the I. Nor can the will be unconditionally called to this action by the fact that the impulse lies in nature.

12. The system of this content, as it occurs directly in the will, exists only as a multitude or multiplicity of impulses, every one of which is mine in a general way along with others, but is at the same time universal and undetermined, having many objects and ways of satisfaction. The will, by giving itself in this two-fold indefiniteness the form of individuality (§7), resolves, and only as resolving is it actual. Note. Instead of to "resolve," i.e. to supersede the indefinite condition in which a content is merely possible, our language has the expression "decide" ("unfold itself"). The indeterminate condition of the will, as neutral but infinitely fruitful germ of all existence, contains within itself its definite character and ends, and brings them forth solely out of itself.

13. By resolution will fixes itself as the will of a definite individual, and as thereby distinguishing itself" from another. However apart from this finite character which it has as consciousness (§8), the immediate will is in virtue of the distinction between its form and its content formal. Hence its resolution as such is abstract, and its content is not yet the content and work of its freedom. Note. To the intelligence, as thinking, the object or content remains universal; the intelligence retains the form merely of a universal activity. Now the universal signifies in will that which is mine, i.e. it is

individuality. And yet, also, the direct and formal will is abstract; its individuality is not yet filled with its free universality. Hence at the beginning the peculiar finitude of the intelligence is in will, and only by exalting itself again to thought and giving itself intrinsic universality does the will transcend the distinction of form and content and make itself objective infinite will. It is therefore a misunderstanding of the nature of thought and will to suppose that in the will man is infinite, while in thought and even in reason he is limited. In so far as thought and will are still distinct, the reverse is rather the case, and thinking reason, when it becomes will, assigns itself to finitude. Addition. A will which resolves nothing, is not an actual will; that which is devoid of definite character never reaches a volition. The reason for hesitation may lie in a sensitiveness, which is aware that in determining itself it is engaged with what is finite, is assigning itself a limit, and abandoning its infinity; it may thus hold to its decision not to renounce the totality which it intends. Such a feeling is dead, even when it aims to be something beautiful. "Who will be great," says Goethe, "must be able to limit himself." By volition alone man enters actuality, however distasteful it may be to him; for indolence will not desert its own self-brooding, in which it clings to a universal possibility. But possibility is not yet actuality. Hence the will, which is secure simply of itself, does not as yet lose itself in any definite reality.

14. The finite will, which has merely from the standpoint of form doubled itself back upon itself, and has become the infinite and self secluded I (§5), stands above its content of different impulses and also above the several ways by which they are realized and satisfied. At the same time, as it is only formally infinite, it is confined to this very content as the decisive feature of its nature and external actuality, although it is undetermined and not confined to one content rather than another (§§6, 11). As to the return of the I into itself such a will is only a possible will, which

may or may not be mine, and the I is only the possibility of deputing itself to this or that object. Hence amongst these definite phases, which in this light are for the I external, the will chooses.

15. Freedom of the will is in this view of it caprice, in which are contained both a reflection, which is free and abstracted from everything, and a dependence upon a content or matter either internally or externally provided. Since the content is in itself or implicitly necessary as an end, and in opposition to this reflection is a definite possibility, caprice, when it is will, is in its nature contingent. Note. The usual idea of freedom is that of caprice. It is a midway stage of reflection between the will as merely natural impulse and the will as free absolutely. When it is said that freedom as a general thing consists in doing what one likes, such an idea must be taken to imply an utter lack of developed thought, containing as yet not even a suspicion of what is meant by the absolutely free will, right, the ethical system, etc. Reflection, being the formal universality and unity of self-consciousness, is the will's abstract certitude of its freedom, but it is not yet the truth of it, because it has not as yet itself for content and end; the subjective side is still different from the objective. Thus the content in such a case remains purely and completely finite. Caprice, instead of being will in its truth, is rather will in its contradiction. In the controversy carried on, especially at the time of the metaphysic of Wolf, as to whether the will is really free, or our consciousness of its freedom is a delusion, it was this caprice which was in the minds of both parties. Against the certitude of abstract self-direction, determinism rightly opposed a content, which was externally presented, and not being contained in this certitude came from without. It did not matter whether this "without" were impulse, imagination, or in general a consciousness so filled that the content was not the peculiar possession of the self-determining activity as such. Since only the formal element of free self-direction is immanent in caprice, while the other

element is something given to it from without, to take caprice as freedom may fairly be named a delusion. Freedom in every philosophy of reflection, whether it be the Kantian or the Eriesian, which is the Kantian superficialized, is nothing more than this formal self-activity. Addition. Since I have the possibility of determining myself in this or that way, since I have the power of choice, I possess caprice, or what is commonly called freedom. This choice is due to the universality of the will, enabling me to make my own this thing or another. This possession is a particular content, which is therefore not adequate to me, but separated from me, and is mine only in possibility; just as I am the possibility of bringing myself into coincidence with it. Hence choice is due to the indeterminateness of the I, and to the determinateness of a content. But as to this content the will is not free, although it has in itself formally the side of infinitude. No such content corresponds to will; in no content can it truly find itself. In caprice it is involved that the content is not formed by the nature of my will, but by contingency. I am dependent upon this content. This is the contradiction contained in caprice. Ordinary man believes that he is free, when he is allowed to act capriciously, but precisely in caprice is it inherent that he is not free. When I will the rational, I do not act as a particular individual but according to the conception of ethical observance in general. In an ethical act I establish not myself but the thing. A man, who acts perversely, exhibits particularity. The rational is the highway on which every one travels, and no one is specially marked. When a great artist finishes a work we say: "It must be so." The particularity of the artist has wholly disappeared and the work shows no mannerism. Phidias has no mannerism; the statue itself lives and moves. But the poorer is the artist, the more easily we discern himself, his particularity and caprice. If we adhere to the consideration that in caprice a man can will what he pleases, we have certainly freedom of a

kind; but again, if we hold to the view that the content is given, then man must be determined by it, and in this light is no longer free.

16. What is resolved upon and chosen (§14) the will may again give up (§5). Yet, even with the possibility of transcending any other content which it may substitute, and of proceeding in this way ad infinitum, the will does not advance beyond finitude, because every content in turn is different from the form and is finite. The opposite aspect, namely in determinateness, irresolution or abstraction, is also one-sided.

17. Since the contradiction involved in caprice (§15) is the dialectic of the impulses and inclinations, it is manifested in their mutual antagonism. The satisfaction of one demands the subjection and sacrifice of the satisfaction of another. Since an impulse is merely the simple tendency of its own essential nature, and has no measure in itself, to subject or sacrifice the satisfaction of any impulse is a contingent decision of caprice. In such a case caprice may act upon the calculation as to which impulse will bring the greater satisfaction, or may have some other similar purpose. Addition. Impulses and inclinations are in the first instance the content of will, and only reflection transcends them. But these impulses are self-directing, crowding upon and jostling one another, and all seeking to be satisfied. To set all but one in the background, and put myself into this one, is to limit and distort myself, since I, in so doing, renounce my universality, which is a system of all the impulses. Just as little help is found in a mere subordination of them, a course usually followed by the understanding. There is available no criterion by which to make such an arrangement, and hence the demand for a subordination is usually sustained by tedious and irrelevant allusions to general sayings.

18. With regard to the moral estimate of impulses, dialectic appears in this form. The phases of the direct or natural will are immanent and positive, and thus good. Hence man is by nature good. But natural

characteristics, since they are opposed to freedom and the conception of the spirit, and are, hence, negative, must be eradicated. Thus man is by nature evil. To decide for either view is a matter of subjective caprice. Addition. The Christian doctrine that man is by nature evil is loftier than the opposite that he is naturally good, and is to be interpreted philosophically in this way. Man as spirit is a free being, who need not give way to impulse. Hence in his direct and unformed condition, man is in a situation in which he ought not to be, and he must free himself. This is the meaning of the doctrine of original sin, without which Christianity would not be the religion of freedom.

19. In the demand that impulses must be purified is found the general idea that they must be freed from the form of direct subjection to nature, and from a content that is subjective and contingent, and must be restored to their substantive essence. The truth contained in this indefinite demand is that impulses should be phases of will in a rational system. To apprehend them in this way as proceeding from the conception is the content of the science of right. Note. The content of this science may, in all its several elements, right, property, morality, family, state, be represented in this way, that man has by nature the impulse to right, the impulse to property, to morality, to sexual love, and to social life. If instead of this form, which belongs to empirical psychology, a philosophic form be preferred, it may be obtained cheap from what in modern times was reputed and still is reputed to be philosophy. He will then say that man finds in himself as a fact of consciousness that he wills right, property, the state, etc. Later will be given still another form of the content which appears here in the shape of impulses, that, namely, of duties.

20. The reflection which is brought to bear upon impulses, placing them before itself, estimating them, comparing them with one another, and contrasting them with their means and consequences, and also with a whole

of satisfaction, namely happiness, brings the formal universal to this material, and in an external way purifies it of its crudity and barbarism. This propulsion by the universality of thought is the absolute worth of civilization (§187). Addition. In happiness thought has already the upper hand with the force of natural impulse, since it is not satisfied with what is momentary, but requires happiness as a whole. This happiness is dependent upon civilization to the extent to which civilization confirms the universal. But in the ideal of happiness there are two elements. There is (1) a universal that is higher than all particulars; yet, as the content of this universal is in turn only universal pleasure, there arises once more the individual, particular and finite, and retreat must be made to impulse; (2) Since the content of happiness lies in the subjective perception of each individual, this universal end is again particular; nor is there present in it any true unity of content and form.

21. But the truth of this formal universality, which taken by itself is undetermined and finds definite character in externally given material, is the self-directing universality which is will or freedom. Since the will has as its object, content and end, universality itself, and thus assumes the form of the infinite, it is free not only in itself or implicitly, but for itself or explicitly. It is the true idea. Note. The self-consciousness of the will in the form of appetite or impulse is sensible, the sensible in general indicating the externality of self-consciousness, or that condition in which self-consciousness is outside of itself. Now this sensible side is one of the two elements of the reflecting will, and the other is the abstract universality of thought. But the absolute will has as its object the will itself as such in its pure universality. In this universality the directness of the natural will is superseded, and so also is the private individuality which is produced by reflection and infects the natural condition. But to supersede these and lift them into the universal, constitutes the activity or thought. Thus the self-

consciousness, which purifies its object, content or end, and exalts it to universality, is thought carrying itself through into will. It is at this point that it becomes clear that the will is true and free only as thinking intelligence. The slave knows not his essence, his infinitude, his freedom; he does not know himself in his essence, and not to know himself is not to think himself. The self-consciousness, which by thought apprehends that itself is essence, and thus puts away from itself the accidental and untrue, constitutes the principle of right, morality, and all forms of ethical observance. They who, in speaking philosophically of right, morality, and ethical observance, would exclude thought and turn to feeling, the heart, the breast, and inspiration, express the deepest contempt for thought and science. And science itself, overwhelmed with despair and utter insipidity, makes barbarism and absence of thought a principle, and so far as in it lay robbed men of all truth, dignity, and worth. Addition. In philosophy truth is had when the conception corresponds to reality. A body is the reality, and soul is the conception. Soul and body should be adequate to each other. A dead man is still an existence, but no longer a true existence; it is a reality void of conception. For that reason the dead body decays. So with the true will; that which it wills, namely, its content, is identical with it, and so freedom wills freedom.

22. The will which exists absolutely is truly infinite, because its object being the will itself, is for it not another or a limitation. In the object the will has simply reverted into itself. Moreover, it is not mere possibility, capacity, potentiality (potentia), but infinitely actual (infinitum actu), because the reality of the conception or its visible externality is internal to itself. Note. Hence when the free will is spoken of without the qualification of absolute freedom, only the capacity of freedom is meant, or the natural and finite will (§11), and, notwithstanding all words and opinions to the contrary, not the free will. Since the understanding comprehends the infinite

only in its negative aspect, and hence as a beyond, it thinks to do the infinite all the more honour the farther it removes it into the vague distance, and the more it takes it as a foreign thing. In free will the true infinite is present and real; it is itself the actually present self-contained idea. Addition. The infinite has rightly been represented as a circle. The straight line goes out farther and farther, and symbolizes the merely negative and bad infinite, which, unlike the true, does not return into itself. The free will is truly infinite, for it is not a mere possibility or disposition. Its external reality is its own inner nature, itself.

23. Only in this freedom is the will wholly by itself, because it refers to nothing but itself, and all dependence upon any other thing falls away. The will is true, or rather truth itself, because its character consists in its being in its manifested reality, or correlative opposite, what it is in its conception. In other words, the pure conception has the perception or intuition of itself as its end and reality.

24. The will is universal, because in it all limitation and particular individuality are superseded. These one-sided phases are found only in the difference between the conception and its object or content, or, from another standpoint, in the difference between the conscious independent existence of the subject, and the will's implicit, or self-involved existence, or between its excluding and concluding individuality, and its universality. Note. The different phases of universality are tabulated in the logic ("Encyclop. of the Phil. Sciences," §§118–126). Imaginative thinking always takes universality in an abstract and external way. But absolute universality is not to be thought of either as the universality of reflection, which is a kind of consensus or generality, or, as the abstract universality and self-identity, which is fashioned by the understanding (§6, note), and keeps aloof from the individual. It is rather the concrete, self-contained, and self-referring universality, which is the substance, intrinsic genus, or

immanent idea of self-consciousness. It is a conception of free will as the universal, transcending its object, passing through and beyond its own specific character, and then becoming identical with itself. This absolute universal is what is in general called the rational, and is to be apprehended only in this speculative way.

25. The subjective side of the will is the side of its self-consciousness and individuality (§7), as distinguished from its implicit conception. This subjectivity is (a) pure form or absolute unity of self-consciousness with itself. This unity is the equation "I = I," consciousness being characterized by a thoroughly inward and abstract self-dependence. It is pure certitude of itself in contrast with the truth; (b) particularity of will, as caprice with its accidental content of pleasurable ends; (g) in general a one-sided form (§8), in so far as that which is willed is at first an unfulfilled end, or a content which simply belongs to self-consciousness.

26. (a) In so far as the will is determined by itself, and is in accord with its conception and true, it is wholly objective will. (b) But objective self-consciousness, which has not the form of the infinite, is a will sunk in its object or condition, whatever the content of that may be. It is the will of the child, or the will present in slavery or superstition, (g) Objectivity is finally a one-sided form in opposition to the subjective phase of will; it is direct reality, or external existence. In this sense the will becomes objective only by the execution of its ends. Note. These logical phases of subjectivity and objectivity, since they are often made use of in the sequel, are here exposed, with the express purpose of noting that it happens with them as with other distinctions and opposed aspects of reflection; they by virtue of their finite and dialectic character pass over into their opposites. For imagination and understanding the meanings of antithetic phases are not convertible, because their identity is still internal. But in will, on the contrary, these phases, which ought to be at once abstract and yet also sides of that which

can be known only as concrete, lead of themselves to identity, and to an exchange of meanings. To the understanding this is unintelligible. Thus, e.g., the will as a freedom which exists in itself, is subjectivity itself; thus subjectivity is the conception of the will, and therefore its objectivity. But subjectivity is finite in opposition to objectivity, yet in this opposition the will is not isolated, but in intricate union with the object; and thus its finitude consists quite as much in its not being subjective, etc. What in the sequel is to be meant by the subjective or the objective side of the will, has each time to be made clear from the context, which will supply their positions in relation to the totality. Addition. It is ordinarily supposed that subjective and objective are blank opposites; but this is not the case. Bather do they pass into one another, for they are not abstract aspects like positive and negative, but have already a concrete significance. To consider in the first instance the expression "subjective;" this may mean an end which is merely the end of a certain subject. In this sense a poor work of art, that is not adequate to the thing, is merely subjective. But, further, this expression may point to the content of the will, arid is then of about the same meaning as capricious; the subjective content then is that which belongs merely to the subject. In this sense bad acts are merely subjective. Further, the pure, empty I may be called subjective, as it has only itself as an object, and possesses the power of abstraction from all further content. Subjectivity has, moreover, a wholly particular and correct meaning in accordance with which anything, in order to win recognition from me, has to become mine and seek validity in me. This is the infinite avarice of subjectivity, eager to comprehend and consume everything within the simple and pure I. Similarly we may take the objective in different ways. By it we may understand anything to which we give existence in contrast to ourselves, whether it be an actual thing or a mere thought, which we place over against ourselves. By it also we understand the direct reality, in which the end is to

be realized. Although the end itself is quite particular and subjective, we yet name it objective after it has made its appearance. Further, the objective will is also that in which truth is; thus, God's will, the ethical will also, are objective. Lastly, we may call the will objective, when it is wholly submerged in its object, as, e.g., the child's will, which is confiding and without subjective freedom, and the slave's will, which does not know itself as free, and is thus a will-less will. In this sense any will is objective, if it is guided in its action by a foreign authority, and has not yet completed the infinite return into itself.

27. The absolute character or, if you like, the absolute impulse of the free spirit (§21) is, as has been observed, that its freedom shall be for it an object. It is to be objective in a two-fold sense: it is the rational system of itself, and this system is to be directly real (§26). There is thus actualized as idea what the will is implicitly. Hence, the abstract conception of the idea of the will is in general the free will which wills the free will.

28. The activity of the will, directed to the task of transcending the contradiction between subjectivity and objectivity, of transferring its end from subjectivity into objectivity, and yet while in objectivity of remaining with itself, is beyond the formal method of consciousness (§8), in which objectivity is only direct actuality. This activity is the essential development of the substantive content of the idea (§21). In this development the conception moulds the idea, which is in the first instance abstract, into the totality of a system. This totality as substantive is independent of the opposition between mere subjective end and its realization, and in both of these forms is the same.

29. That a reality is the realization of the free will, this is what is meant by a right. Right, therefore, is, in general, freedom as idea. Note. In the Kantian doctrine (Introduction to Kant's "Theory of Right"), now generally accepted, "the highest factor is a limitation of my freedom or caprice, in

order that it may be able to subsist alongside of every other individual's caprice in accordance with a universal law." This doctrine contains only a negative phase, that of limitation. And besides, the positive phase, the universal law or so-called law of reason, consisting in the agreement of the caprice of one with that of another, goes beyond the well-known formal identity and the proposition of contradiction. The definition of right, just quoted, contains the view which has especially since Rousseau spread widely. According to this view neither the absolute and rational will, nor the true spirit, but the will and spirit of the particular individual in their peculiar caprice, are the substantive and primary basis. When once this principle is accepted, the rational can announce itself only as limiting this freedom. Hence it is not an inherent rationality, but only a mere external and formal universal. This view is accordingly devoid of speculative thought, and is rejected by the philosophic conception. In the minds of men and in the actual world it has assumed a shape, whose horror is without a parallel, except in the shallowness of the thoughts upon which it was founded.

30. Right in general is something holy, because it is the embodiment of the absolute conception and self-conscious freedom. But the formalism of right, and after a while of duty also, is due to distinctions arising out of the development of the conception of freedom. In contrast with the more formal, abstract and limited right, there is that sphere or stage of the spirit, in which spirit has brought to definite actuality the further elements contained in the idea. This stage is the richer and more concrete; it is truly universal and has therefore a higher right. Note. Every step in the development of the idea of freedom has its peculiar right, because it is the embodiment of a phase of freedom. When morality and ethical observance are spoken of in opposition to right, only the first or formal right of the abstract personality is meant. Morality, ethical observance, a state-interest, are every one a special right, because each of these is a definite realization

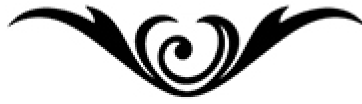
of freedom. They can come into collision only in so far as they occupy the same plane. If the moral standpoint of spirit were not also a right and one of the forms of freedom, it could not collide with the right of personality or any other right. A right contains the conception of freedom which is the highest phase of spirit, and in opposition to it any other kind of thing is lacking in real substance. Yet collision also implies a limit and a subordination of one phase to another. Only the right of the world-spirit is the unlimited absolute.

31. The scientific method by which the conception is self-evolved, and its phases self- developed and self-produced, is not first of all an assurance that certain relations are given from somewhere or other, and then the application to this foreign material of the universal. The true process is found in the logic, and here is presupposed. Note. The efficient or motive principle, which is not merely the analysis but the production of the several elements of the universal, I call dialectic. Dialectic is not that process in which an object or proposition, presented to feeling or the direct consciousness, is analyzed, entangled, taken hither and thither, until at last its contrary is derived. Such a merely negative method appears frequently in Plato. It may fix the opposite of any notion or reveal the contradiction contained in it, as did the ancient scepticism, or it may in a feeble way consider an approximation to truth, or modern half-and-half attainment of it, as its goal. But the higher dialectic of the conception does not merely apprehend any phase as a limit and opposite, but produces out of this negative a positive content and result. Only by such a course is there development and inherent progress. Hence this dialectic is not the external agency of subjective thinking, but the private soul of the content, which unfolds its branches and fruit organically. Thought regards this development of the idea and of the peculiar activity of the reason of the idea as only subjective, but is on its side unable to make any addition. To consider

anything rationally is not to bring reason to it from the outside, and work it up in this way, but to count it as itself reasonable. Here it is spirit in its freedom, the summit of self-conscious reason, which gives itself actuality, and produces itself as the existing world. The business of science is simply to bring the specific work of the reason, which is in the thing, to consciousness.

32. The phases of the development of the conception are themselves conceptions. And yet, because the conception is essentially the idea, they have the form of manifestations. Hence the sequence of the conceptions, which arise in this way, is at the same time a sequence of realizations, and are to be by science so considered. Note. In a speculative sense the way, in which a conception is manifested in reality, is identical with a definite phase of the conception. But it is noteworthy that, in the scientific development of the idea, the elements, which result in a further definite form, although preceding this result as phases of the conception, do not in the temporal development go before it as concrete realizations. Thus, as will be seen later, that stage of the idea which is the family presupposes phases of the conception, whose result it is. But that these internal presuppositions should be present in such visible realizations as right of property, contract, morality, etc., this is the other side of the process, which only in a highly developed civilization has attained to a specific realization of its elements. Addition. The idea must always go on determining itself within itself, since at the beginning it is only abstract conception. However, this initial abstract conception is never given up, but only becomes inwardly richer, the last phase being the richest. The earlier and merely implicit phases reach in this way free self-dependence, but in such a manner that the conception remains the soul which holds everything together, and only through a procedure immanent within itself arrives at its own distinctions. Hence the last phase falls again into a unity with the first, and it cannot be said that the

conception ever comes to something new. Although the elements of the conception appear to have fallen apart when they enter reality, this is only a mere appearance. Its superficial character is revealed in the process, since all the particulars finally turn back again into the conception of the universal. The empirical sciences usually analyze what they find in pictorial ideas, and if the individual is successfully brought back to the general, the general property is then called the conception. But this is not our procedure. We desire only to observe how the conception determines itself, and compels us to keep at a distance everything of our own spinning and thinking. But what we get in this way is one series of thoughts and another series of realized forms. As to these two series, it may happen that the order of time of the actual manifestations is partly different from the order of the conception. Thus it cannot, e.g., be said that property existed before the family, and yet, in spite of that it is discussed before the family is discussed. The question might also be raised here, Why do we not begin with the highest, i.e., with concrete truth? The answer is, because we desire to see truth in the form of a result, and it is an essential part of the process to conceive the conception first of all as abstract The actual series of realizations of the conception is thus for us in due course as follows, even although in actuality the order should be the same. Our process is this, that the abstract forms reveal themselves not as self-subsistent but as untrue. Division of the Work.



33. According to the stages in the development of the idea of the absolutely free will, A. The will is direct or immediate; its conception is therefore abstract, i.e., personality, and its embodied reality is a direct external thing. This is the sphere of abstract or formal right. B. The will, passing out of external reality, turns back into itself. Its phase is subjective individuality, and it is contrasted with the universal. This universal is on its internal side the good, and on its external side a presented world, and these

two sides are occasioned only by means of each other. In this sphere the idea is divided, and exists in separate elements. The right of the subjective will is in a relation of contrast to the right of the world, or the right of the idea. Here, however, the idea exists only implicitly. This is the sphere of morality. C. The unity and truth of these two abstract elements. The thought idea of the good is realized both in the will turned back into itself, and also in the external world. Thus freedom exists as real substance, which is quite as much actuality and necessity as it is subjective will. The idea here is its absolutely universal existence, viz., ethical observance. This ethical substance is again, a. Natural spirit; the family, b. The civic community, or spirit in its dual existence and mere appearance, c. The state, or freedom, which, while established in the free self dependence of the particular will is also universal and objective. This actual and organic spirit (a) is the spirit of a nation, (b) is found in the relation to one another of national spirits, and (g) passing through and beyond this relation is actualized and revealed in world history as the universal world-spirit, whose right is the highest. Note. It is to be found in the speculative logic, and here is presupposed, that a thing or content, which is established first of all according to its conception, or implicitly, has the form of direct existence. The conception, however, when it has the form of the conception is explicit, and no longer is a direct existence. So, too, the principle, upon which the division of this work proceeds, is presupposed. The divisions might be regarded as already settled by history, since the different stages must be viewed as elements in the development of the idea, and therefore as springing from the nature of the content itself. A philosophic division is not an external classification of any given material, such a classification as would be made according to one or several schemes picked up at random, but the inherent distinctions of the conception itself. Morality and ethical observance, which are usually supposed to mean the same thing, are here taken in essentially different

meanings. Meanwhile even imaginative thought seems to make a distinction between them. In the usage of Kant the preference is given to the term morality, and the practical principles of his philosophy limit themselves wholly to this standpoint, making impossible the standpoint of ethical observance, and indeed expressly destroying and abolishing it. Although morality and ethics have the same meaning according to their etymology, yet these different words may be used for different conceptions. Addition. When we speak of right, we mean not only civil right, which is the usual significance of the word, but also morality, ethical observance and world-history. These belong to this realm, because the conception taking them in their truth, brings them all together. Free will, in order not to remain abstract, must in the first instance give itself reality; the sensible materials of this reality are objects, i.e., external things. This first phase of freedom we shall know as property. This is the sphere of formal and abstract right, to which belong property in the more developed form of contract and also the injury of right, i.e., crime and punishment. The freedom, we have here, we name person, or, in other words, the subject who is free, and indeed free independently, and gives himself a reality in things. But this direct reality is not adequate to freedom, and the negation of this phase is morality. In morality I am beyond the freedom found directly in this thing, and have a freedom in which this directness is superseded. I am free in myself, i.e., in the subjective. In this sphere we come upon my insight, intention, and end, and externality is established as indifferent. The good is now the universal end, which is not to remain merely internal to me, but to realize itself. The subjective will demands that its inward character, or purpose, shall receive external reality, and also that the good shall be brought to completion in external existence. Morality, like formal right, is also an abstraction, whose truth is reached only in ethical observance. Hence ethical observance is the unity of the will in its conception with the will of the individual or subject.

The primary reality of ethical observance is in its turn natural, taking the form of love and feeling. This is the family. In it the individual has transcended his prudish personality, and finds himself with his consciousness in a totality. In the next stage is seen the loss of this peculiar ethical existence and substantive unity. Here the family falls asunder, and the members become independent one of another, being now held together merely by the bond of mutual need. This is the stage of the civic community, which has frequently been taken for the state. But the state does not arise until we reach the third stage, that stage of ethical observance or spirit, in which both individual independence and universal substantivity are found in gigantic union. The right of the state is, therefore, higher than that of the other stages. It is freedom in its most concrete embodiment, which yields to nothing but the highest absolute truth of the world-spirit.

First Part: Abstract Right.

34. THE COMPLETELY free will, when it is conceived abstractly, is in a condition of self-involved simplicity. What actuality it has when taken in this abstract way, consists in a negative attitude towards reality, and a bare abstract reference of itself to itself. Such an abstract will is the individual will of a subject. It, as particular, has definite ends, and, as exclusive and individual, has these ends before itself as an externally and directly presented world. Addition. The remark that the completely free will, when it is taken abstractly, is in a condition of self-involved simplicity must be understood in this way. The completed idea of the will is found when the conception has realized itself fully, and in such a manner that the embodiment of the conception is nothing but the development of the conception itself. But at the outset the conception is abstract. All its future characters are implied in it, it is true, but as yet no more than implied. They are, in other words, potential, and are not yet developed into an articulate whole. If I say, "I am free," the I, here, is still implicit and has no real object opposed to it. But from the standpoint of morality as contrasted with abstract right there is opposition, because there I am a particular will, while the good, though within me, is the universal. Hence, at that stage, the will contains within itself the contrast between particular and universal, and in that way is made definite. But at the beginning such a distinction does not occur, because in the first abstract unity there is as yet no progress or modification of any kind. That is what is meant by saying that the will has the mark of self-involved simplicity or immediate being. The chief thing to notice at this point is that this very absence of definite features is itself a definite feature. Absence of determinate character exists where there is as

yet no distinction between the will and its content. But when this lack of definiteness is set in opposition to the definite, it becomes itself something definite. In other words, abstract identity becomes the distinguishing feature of the will, and the will thereby becomes an individual will or person.

35. This consciously free will has a universal side, which consists in a formal, simple and pure reference to itself as a separate and independent unit. This reference is also a self-conscious one though it has no further content. The subject is thus so far a person. It is implied in personality that I, as a distinct being, am on all sides completely bounded and limited, on the side of inner caprice, impulse and appetite, as well as in my direct and visible outer life. But it is implied likewise that I stand in absolutely pure relation to myself. Hence it is that in this finitude I know myself as infinite, universal and free. Note. Personality does not arise till the subject has not merely a general consciousness of himself in some determinate mode of concrete existence, but rather a consciousness of himself as a completely abstract I, in which all concrete limits and values are negated and declared invalid. Hence personality involves the knowledge of oneself as an object, raised, however, by thought into the realm of pure infinitude, a realm, that is, in which it is purely identical with itself. Individuals and peoples have no personality, if they have not reached this pure thought and self-consciousness. In this way, too, the absolute or completed mind or spirit may be distinguished from its semblance. The semblance, though self-conscious, is aware of itself only as a merely natural will with its eternal objects. The other, as an abstract and pure I, has as itself as its end and object, and is therefore a person. Addition. The abstract will, the will which exists for itself, is a person. The highest aim of man is to be a person, and yet again the mere abstraction "person" is not held in high esteem. Person is essentially different from subject. Subject is only the possibility of personality. Any living thing at all is a subject, while person is a subject

which has its subjectivity as an object. As a person I exist for myself. Personality is the free being in pure self-conscious isolation. I as a person am conscious of freedom. I can abstract myself from everything, since nothing is before me except pure personality. Notwithstanding all this I am as a particular person completely limited. I am of a certain age, height, in this space, and so on. Thus a person is at one and the same time so exalted and so lowly a thing. In him is the unity of infinite and finite, of limit and unlimited. The dignity of personality can sustain a contradiction, which neither contains nor could tolerate anything natural.

36. (1) Personality implies, in general, a capacity to possess rights, and constitutes the conception and abstract basis of abstract right. This right, being abstract, must be formal also. Its mandate is: Be a person and respect others as persons.

37. (2) The particularity of the will, that phase of the will, namely, which implies a consciousness of my specific interests, is doubtless an element of the whole consciousness of the will (§34), but it is not contained in mere abstract personality. It is indeed present in the form of appetite, want, impulse and random desire, but is distinct as yet from the personality, which is the essence of freedom. In treating of formal right therefore, we do not trench upon special interests, such as my advantage or my well-being, nor have we here to do with any special reason or intention of the will. Addition. Since the particular phases of the person have not as yet attained the form of freedom, everything relating to these elements is so far a matter of indifference. When anyone bases a claim upon his mere formal right, he may be wholly selfish, and often such a claim comes from a contracted heart and mind. Uncivilized man, in general, holds fast to his rights, while a more generous disposition is alert to see all sides of the question. Abstract right is, moreover, the first mere possibility, and in contrast with the whole context of a given relation is still formal. The possession of a right gives a

certain authority, it is true, but it is not, therefore, absolutely necessary that I insist upon a right, which is only one aspect of the whole matter. In a word, possibility is something, which means that it either may or may not exist.

38. In contrast with the deeper significance of a concrete act in all its moral and social bearings, abstract right is only a possibility. Such a right is, therefore, only a permission or indication of legal power. Because of this abstract character of right the only rule which is unconditionally its own is merely the negative principle not to injure personality or anything which of necessity belongs to it. Hence we have here only prohibitions, the positive form of command having in the last resort a prohibition as its basis.

39. (3) A person in his direct and definite individuality is related to a given external nature. To this outer world the personality is opposed as something subjective. But to confine to mere subjectivity the personality, which is meant to be infinite and universal, contradicts and destroys its nature. It bestirs itself to abrogate the limitation by giving itself reality, and proceeds to make the outer visible existence its own.

40. Right is at first the simple and direct concrete existence which freedom gives itself directly. This un-modified existence is (a) Possession or property. Here freedom is that of abstract will in general, or of a separate person who relates himself only to himself. (b) A person by distinguishing himself from himself becomes related to another person, although the two have fixed existence for each other except as owners. Their implicit identity becomes realized through a transference of property by mutual consent, and with the preservation of their rights. This is contract. (c) The will in its reference to itself, as in (a), may be at variance not with some other person, (b), but within itself. As a particular will it may differ from and be in opposition to its true and absolute self. This is wrong and crime. Note. The division of rights into personal right, real right, and right to actions is, like many other divisions, intended to systematize the mass of unorganized

material. But this division utterly confuses rights which presuppose such concrete relations as the family or the state with those which refer to mere abstract personality. An example of this confusion is the classification, made popular by Kant, of rights into Real Rights, Personal Rights, and Personal Rights that are Real in kind. It would take us too far afield to show how contorted and irrational is the classification of rights into personal and real, a classification which lies at the foundation of Roman law. The right to actions concerns the administration of justice, and does not fall under this branch of the subject. Clearly it is only personality which gives us a right to things, and therefore personal right is in essence real right. A thing must be taken in its universal sense as the external opposite of freedom, so that in this sense my body and my life are things. Thus real right is the right of personality as such. In the interpretation of personal right, found in Roman law, a man is not a person till he has reached a certain status (Heineccii "Elem. Jur. Civ.," §lxxv.). In Roman law personality is an attribute of a class and is contrasted with slavery. The so-called personal right of Roman law includes not only a right to slaves, a class to which probably belong the children, not only a right over the class which has been deprived of right (capitis diminutio), but also family relations. With Kant, family relations are wholly personal rights which are real in kind. The Roman personal right is not the right of a person as such, but of a special person. It will be afterwards shown that the family relation is really based upon the renunciation of personality. It cannot but seem an inverted method to treat of the rights of persons who belong to definite classes before the universal right of personality. According to Kant personal rights arise out of a contract or agreement that I should give or perform something; this is the jus ad rem of Roman law which has its source in an obligatio. Only a person, it is true, can perform a thing through contract; and further, only a person can acquire the right to such a performance. Yet we cannot,

therefore, call such a right personal. Every sort of right is right of a person; but a right, which springs out of contract, is not a right to a person, but only to something external to him, or to be disposed of by him; and this is always a thing.

First Section. Property.

41. A PERSON must give to his freedom an external sphere, in order that he may reach the completeness implied in the idea. Since a person is as yet the first abstract phase of the completely existent, infinite will, the external sphere of freedom is not only distinguishable from him but directly different and separable. Addition. The reasonableness of property consists not in its satisfying our needs, but in its superseding and replacing the subjective phase of personality. It is in possession first of all that the person becomes rational. The first realization of my freedom in an external object is an imperfect one, it is true, but it is the only realization possible so long as the abstract personality has this firsthand relation to its object.

42. That which is defined as different from the free spirit is both in its own nature and also for this spirit the external. It is an object, something not free, impersonal and without rights. Note. “Thing,” like “objective,” has two opposite meanings. When we say “That is the thing or fact,” “It depends on the thing itself, not on the person,” we mean by “thing” that which is real and substantive. But it is also contrasted with person, which here includes more than a particular subject, and then it means the opposite of the real and substantive, and is something merely external. What is external for the free spirit, which is different from mere consciousness, is absolutely external. Hence nature is to be conceived as that which is external in its very self. Addition. Since a thing has no subjectivity it is external not merely to a subject, but to itself. Space and time are external. I, as sensible, am external, spatial, and temporal. My faculty of sense-perception is external to itself. An animal may perceive, but the soul of the animal has as its object not itself, but something external.

43. The person in his direct conception and as a separate individual has an existence which is purely natural. This existence is something partly inalienable, partly akin in its nature to the external world. As the individual is considered in his first abstract simplicity, reference is here made only to those features of personality with which he is directly endowed, not to those which he might proceed to acquire by voluntary effort. Note. Mental endowments, science, art, such matters of religion as sermons, masses, prayers, blessings of consecrated utensils, inventions also, are objects of exchange, recognized things to be bought and sold. It is possible to ask, also, if an artist or scholar is in legal possession of his art, science, or capacity to preach or read mass; and the question is put on the presumption that these objects are things. Yet one hesitates to call such gifts, knowledge, powers, mere things, because although they may be bargained for as a thing, they have an inner spiritual side. Hence the understanding becomes confused as to how they are to be regarded at law. Before the understanding always arises an exclusive disjunction, which in this case is that something must be either a thing or not a thing. It is like the disjunctive judgment that a thing must be either finite or infinite. But, though knowledge, talents, etc., are the possession of the free mind, and therefore internal to it, they may be relinquished and given an external existence. (See below.) They would then fall under the category of things. They are not direct objects at the first, but the spirit lowers its inner side to the level of the directly external. According to the unjust and immoral finding of the Roman law, children were things for their father, and he was in legal possession of them. At the same time he was related to them ethically by the tie of love, although the value of this relation was much weakened by the legal usage. In this legal relation there occurs a completely wrong union of thing and not-thing. The essential feature of abstract right is that its object is the person as such, with only those elements added which, belonging to the external and visible

embodiment of his freedom, are directly different from him and separable. Other phases it can include only after the conscious operation of the subjective will. Mental endowments, the sciences, etc., come up for treatment only from the standpoint of legal possession. The possession of the body and the mind, which is acquired by education, study and habit, is an inward property of the spirit, and does not fall to be considered here. The process by which a mental possession passes into the external world and comes under the category of a legal property, will be taken up later, under relinquishment.

44. A person has the right to direct his will upon any object, as his real and positive end. The object thus becomes his. As it has no end in itself, it receives its meaning and soul from his will. Mankind has the absolute right to appropriate all that is a thing. Note. There is a philosophy which ascribes to the impersonal, to separate things, as they are directly apprehended, an independent and absolutely complete reality. There is also a philosophy which affirms that the mind cannot know what the truth or the thing in itself is. These philosophies are directly contradicted by the attitude of the free will to these things. Although the so-called external things seem to have an independent reality in consciousness as perceiving and imagining, the free will is the idealization or truth of such reality. Addition. A man may own anything, because he is a free will, and is therefore self-contained and self-dependent. But the mere object is of an opposite nature. Every man has the right to turn his will upon a thing or make the thing an object of his will, that is to say, to set aside the mere thing and recreate it as his own. As the thing is in its nature external, it has no purpose of its own and contains no infinite reference to itself; it is external to itself. An animal also is external to itself, and is, so far, a thing. Only the will is the unlimited and absolute, while all other things in contrast with the will are merely relative. To appropriate is at bottom only to manifest the majesty of my will towards

things, by demonstrating that they are not self-complete and have no purpose of their own. This is brought about by my instilling into the object another end than that which it primarily had. When the living thing becomes my property it gets another soul than it had. I give it my will. Free will is thus the idealism which refuses to hold that things as they are can be self-complete. Realism on the other hand declares them to be absolute in their finite form. But this realistic philosophy is not shared in by the animal, which by consuming things proves that they are not absolutely independent.

45. To have something in my power, even though it be externally, is possession. The special fact that I make something my own through natural want, impulse or caprice, is the special interest of possession. But, when I as a free will am in possession of something, I get a tangible existence, and in this way first became an actual will. This is the true and legal nature of property, and constitutes its distinctive character. Note. Since our wants are looked upon as primary, the possession of property appears at first to be a means to their satisfaction; but it is really the first embodiment of freedom and an independent end.

46. Since property makes objective my personal individual will, it is rightly described as a private possession. On the other hand, common property, which may be possessed by a number of separate individuals, is a mark of a loosely joined company, in which a man may or may not allow his share to remain at his own choice. Note. The elements of nature cannot become private property. In the agrarian laws of Rome may be found a conflict between collective and private ownership of land. Private possession is the more reasonable, and, even at the expense of other rights, must win the victory. Property bound up with family trusts contains an element which is opposed to the right of personality and private ownership. Yet private possession must be kept subject to the higher spheres of right, to a corporate body, e.g., or to the state, as happens when private ownership is

entrusted to a so- called moral person, as in mortmain. Yet these exceptions are not to be based on chance, private caprice or personal benefit, but only on the rational organization of the state. The idea of Plato's "Republic" does a wrong to the person, in regarding him as unable to hold property. The theory of a pious, friendly, or even compulsory brotherhood of men, who are to possess all their goods in common, and to banish the principle of private ownership, easily presents itself to one who fails to understand the nature of freedom of spirit, and the nature of right, through mistaking their definite phases. There is a moral or religious side, also. When the friends of Epicurus proposed to establish a community of goods, he dissuaded them on the ground that the plan indicated a lack of confidence in one another, and that those who mistrusted one another could not be friends ("Diog. Laërt." 1. x. n. vi). Addition. In property my will is personal. But the person, it must be observed, is this particular individual, and, thus, property is the embodiment of this particular will. Since property gives visible existence to my will, it must be regarded as "this" and hence as "mine." This is the important doctrine of the necessity of private property. If exceptions may be made by the state, the state alone can be suffered to make them. But frequently, and especially in our time, it has restored private possession. Thus, for instance, many states have rightly abolished cloisters, because persons, living together in these institutions, have ultimately no such right to property, as the person has.

47. As a person, I am an individual in only its simplest aspect; more definitely, I am alive in a particular bodily organism. My body is as to its content my universal undifferentiated external existence; it is the real possibility of all definite phases. But also as a person I have my life and body, as I have other things only in so far as they express my will. Note. The view that the individual, not in his actualized existence but in his direct conception, is to be taken simply as living and having a physical organism

follows from the conception of that phase of life and spirit, which we know as soul. The details of this conception are found in the philosophy of nature. I have organs and life only so far as I will. The animal cannot mutilate or kill itself, but a human being can. Addition. Animals do in a manner possess themselves. Their soul is in possession of their body. But they have no right to their life, because they do not will it.

48. The body, merely as it stands, is not adequate to spirit. In order to be a willing instrument and vitalized means, it must first be taken possession of by the spirit (§57). Still for others I am essentially a freebeing in my body, as I directly have it. Note. It is only because I in my living body am a free being, that my body cannot be used as a beast of burden. In so far as the I lives, the soul, which conceives and, what is more, is free, is not separated from the body. The body is the outward embodiment of freedom, and in it the I is sensible. It is an irrational and sophistic doctrine, which separates body and soul, calling the soul the thing in itself and maintaining that it is not touched or hurt when the body is wrongly treated, or when the existence of a person is subject to the power of another. I can indeed withdraw out of my existence into myself and make my existence something external. I can regard any present feeling as something apart from my real self, and may in this way be free even in chains. But that is an affair of my will. I exist for others in my body; that I am free for others is the same thing as that I am free in this outward life. If my body is treated roughly by others, I am treated roughly. Since it is I that am sensible, violence offered to my body touches me instantly and directly. This is the difference between personal assault and injury to any external property. In property my will is not so vividly present as it is in my body.

49. In my relation to external things, the rational element is that it is I who own property. But the particular element on the other hand is concerned with ends, wants, caprices, talents, external circumstances, etc.

(§45). Upon them, it is true, mere abstract possession depends, but they in this sphere of abstract personality are not yet identical with freedom. Hence what and how much I possess is from the standpoint of right a matter of indifference. Note. If we can speak of several persons, when as yet no distinction has been drawn between one person and another, we may say that in personality all persons are equal. But this is an empty tautological proposition, since a person abstractedly considered is not as yet separate from others, and has no distinguishing attribute. Equality is the abstract identity set up by the mere understanding. Upon this principle mere reflecting thought, or, in other words, spirit in its middle ranges, is apt to fall, when before it there arises the relation of unity to difference. This equality would be only the equality of abstract persons as such, and would exclude all reference to possession, which is the basis of inequality. Sometimes the demand is made for equality in the division of the soil of the earth, and even of other kinds of wealth. Such a claim is superficial, because differences of wealth are due not only to the accidents of external nature but also to the infinite variety and difference of mind and character. In short, the quality of an individual's possessions depends upon his reason, developed into an organic whole. We cannot say that nature is unjust in distributing wealth and property unequally, because nature is not free and, therefore, neither just nor unjust. It is in part a moral desire that all men should have sufficient income for their wants, and when the wish is left in this indefinite form it is well-meant, although it, like everything merely well-meant, has no counterpart in reality. But, further, income is different from possession and belongs to another sphere, that of the civic community. Addition. — Since wealth depends upon application, equality in the distribution of goods would, if introduced, soon be disturbed again. What does not permit of being carried out, ought not to be attempted. Men are equal, it is true, but only as persons, that is, only with reference to the

source of possession. Accordingly every one must have property. This is the only kind of equality which it is possible to consider. Beyond this is found the region of particular persons, and the question for the first time comes up, How much do I possess? Here the assertion that the property of every man ought in justice to be equal to that of every other is false, since justice demands merely that every one should have property. Indeed, amongst persons variously endowed inequality must occur, and equality would be wrong. It is quite true that men often desire the goods of others; but this desire is wrong, for right is unconcerned about differences in individuals.

50. It is a self-evident and, indeed, almost superfluous remark that an object belongs to him who is accidentally first in possession of it. A second person cannot take into possession what is already the property of another. Addition. So far we have been chiefly concerned with the proposition that personality must find an embodiment in property. From what has been said, it follows that he who is first in possession is likewise owner. He is rightful owner, not because he is first, but because he is a free will. He is not first till some one comes after him.

51. In order to fix property as the outward symbol of my personality, it is not enough that I represent it as name and internally will it to be mine; I must also take it over into my possession. The embodiment of my will can then be recognized by others as mine. That the object, of which I take possession be unowned is a self-evident, negative condition (§50). Rather it is more than a bare negative, since it anticipates a relation to others. Addition. A person's putting his will into an object is the conception of property, and the next step is the realizing of it. The inner act of my will, which says that something is mine, must be made recognizable for others. When I make an object mine, I give it a predicate, which must be manifested in its outer form, and not remain merely in my inner will. Children often affirm this earlier act of will against the real possessing of a

thing by others. But for adults such a will is not enough. The form of subjectivity must be removed by working itself out into something objective.

52. Active possession makes the material of an object my property, since the material is not independently its own. Note. The material opposes itself to me. Indeed its very nature is to furnish opposition to me. It exhibits its abstract independence to my abstract or sentient consciousness. The sentient imagination, it may be said in passing, puts the truth upside down when it regards the sentient side of mind as concrete, and the rational as abstract. In reference therefore to the will and property this absolute independence of the material has no truth. Active possession, viewed as an external activity, by which the universal right of appropriating natural things becomes actualized, is allied to physical strength, cunning, skill, all the means, in short, by which one is able to take hold corporeally of a thing. Owing to the qualitative differences of natural objects, the mastery over and possession of them has an infinitely diversified meaning, and a corresponding limitation and contingency. Moreover, no one kind of matter, such as an element, can be wholly possessed by any number of separate persons. In order to become a possible object of possession, it must be taken in separate parts, as a breath of air or draught of water. The impossibility of owning one kind of matter, or an element, depends finally, not upon external physical incapacity, but upon the fact that the person, as will, is not only individual, but directly individual, and that the external exists for him, therefore, only as a collection of particulars. (§13, note to §43.) The process, by which we become master and external owner, is in a sense infinite, and must remain more or less undetermined and incomplete. None the less, however, has the material an essential form, because of which alone it is anything. The more I appropriate this form, so much the more do I come into real possession of the object. The consumption of food is a through-and- through change of its

quality. The cultivation of skill in my body, and the education of my mind, are also more or less an active possession by means of thorough-going modification. Mind or spirit is above all that which I can make my own. But this possession is different from property. Property is completed in its relation to the free will. In the external relation of active possession something of externality remains as a residue, but with regard to the free will the owned object has reserved nothing. A matter without qualities, a something which in property is supposed to remain outside of me, and to belong wholly to the object, is an empty abstraction, which thought must expose and defeat. Addition. Fichte has raised the question, whether, if I have fashioned an object, its material is also mine. According to his view, if I have made a cup out of gold, any one may take the gold, provided that he does no injury to my handiwork. Though we may imagine that form and substance are separable in that way, the distinction is an empty subtlety. If I take possession of a field, and plough it, not only is the furrow mine, but also the ground which belongs to it. It is my will to take possession of the material, even the whole object. Hence the material is not masterless; it is not its own. Even if the material remains outside of the form which I give the object, the form is a sign that the object is to be mine. Hence the thing does not stay outside of my will or purpose. There is consequently nothing in it which can be taken hold of by another.

53. Property has its more direct phases in the relation of the will to the object. This relation is (a) direct and active taking of possession, in so far as the will is embodied in the object as in something positive. (b) In so far as this object is negative towards the will, the will is visibly embodied in it as something to be negated. This is use. (g) The return of the will into itself out of the object; this is relinquishment. These three phases are the positive, negative, and infinite judgments of the will concerning the object. A. The Act of Possession.

54. Taking possession is partly the simple bodily grasp, partly the forming and partly the marking or designating of the object. Addition. These modes of taking possession exhibit the progress from the category of particularity to that of universality. Bodily seizure can be made only of particular objects, while marking an object is done by a kind of picture-thinking. In marking I keep before me a representation, by which I intend that the object shall be mine in its totality, and not merely the part which I can hold in my hand.

55. (a) Corporeal possession, in which I am present directly, and my will is directly visible, appeals at once to the senses, and from that standpoint is the most complete kind of possession. But it is after all only subjective, temporary and greatly limited as well by surroundings as by the qualities of the object. But if I can connect an object with anything I have already, or if the two become connected accidentally, the sphere of direct physical prehension is to some extent enlarged. Note. Mechanical forces, weapons, instruments extend the compass of my power. If my ground is washed by the sea or a river, or lies adjacent to a bit of good hunting country or a pasturage, if it contains stone or other minerals, if there is any treasure in it or upon it, in each of these ways possession may be enlarged. It is the same if the enlargement occurs after I have possession and accidentally, as is the case with so-called natural accretions, such as alluvia] deposits, and with objects that are stranded. Everything that is born is also an extension of my wealth, foetura as they are called; but as they involve an organic relation, and are not external additions to an object already in my possession, they are different from the other accessories. All these adjuncts, some of them mutually exclusive, are possibilities by which one owner rather than another may the more easily take a piece of land into possession, or work it up; they may also be viewed as mere accidental accompaniments of the object to which they are added. They are in fact external concomitants which do not

include any conception or living union. Hence it devolves upon the understanding to bring forward and weigh reasons for or against their being mine, and to apply the positive edicts of the law, so that a decision may be reached in accordance with the relative closeness of the connection between the object and its accessory. Addition. The act of possession assumes a separation of parts in the object. I take no more into my possession than I can touch with my body. But, secondly, external things have a wider range than I am able to cover physically. Something else stands in connection with what I own. Through the hand I exercise the act of ownership, but the compass of the hand can be enlarged. No animal has this noble member. What I grasp with it can itself become a means to further prehension. When I come into possession of a thing, the understanding goes at once over into it, and as a consequence not only what is directly laid hold upon is mine, but likewise what is connected with it. At this juncture positive law must introduce its prescripts, because nothing more than this can be deduced from the conception.

56. (b) When something that is mine is formed, it becomes independent of me, ceasing to be limited to my presence in this space or time, or to the presence of my consciousness and will. Note. The fashioning of a thing is the kind of active possession which is most adequate to the idea, because it unites the subjective and the objective. It varies infinitely according to the quality of the object and the purpose of the subject. To this head belongs likewise the formation or nurture of living things, in which my work does not remain something foreign, but is assimilated, as in the cultivation of the soil, the care of plants, and the taming, feeding, and tending of animals. It includes also any arrangement for the more efficient use of natural products or forces, as well as the effect of one material upon another, etc. Addition. This act of forming may in practice assume the greatest variety of aspects. The soil, which I till, is formed. The forming of the inorganic is sometimes

indirect. When I, for instance, build a windmill, I have not formed the air, but I form something which will utilize the air. Yet, as I have not formed the air, I dare not call it mine. Moreover the sparing of a wild animal's life may be viewed as a forming, since my conduct is the preservation of the object. It is the same kind of act as the training of animals, only that training is more direct, and proceeds more largely from me.

57. In his direct life, before it is idealized by self-consciousness, man is merely a natural being, standing outside of his true conception. Only through the education of his body and mind, mainly by his becoming conscious of himself as free, does he take possession of himself, become his own property, and stand in opposition to others. This active possession of himself, conversely, is the giving of actuality to what he is in conception, in his possibilities, faculties, and disposition. By this process he is for the first time securely established as his own, becomes a tangible reality as distinguished from a simple consciousness of himself, and is capable of assuming the form of an object (§43, note). Note. We are now in a position to consider slavery. We may set aside the justification of slavery based upon the argument that it originates in superior physical force, the taking of prisoners in war, the saving and preserving of life, upbringing, education, or bestowal of kindnesses. These reasons all rest ultimately on the ground that man is to be taken as a merely natural being, living, or, it may even be, choosing a life which is not adequate to his conception. Upon the same footing stands the attempted justification of ownership as merely the status of masters, as also all views of the right to slaves founded on history. The assertion of the absolute injustice of slavery on the contrary, clinging to the conception that man, as spiritual, is free of himself, is also a onesided idea, since it supposes man to be free by nature. In other words, it takes as the truth the conception in its direct and unreflective form rather than the idea. This antinomy, like all others, rests upon the external thinking, which keeps

separate and independent each of two aspects of a single complete idea. In point of fact, neither aspect, if separated from the other, is able to measure the idea, and present it in its truth. It is the mark of the free spirit (§21) that it does not exist merely as conception or naturally, but that it supersedes its own formalism, transcending thereby its naked natural existence, and gives to itself an existence, which, being its own, is free. Hence the side of the antinomy, which maintains the conception of freedom, is to be preferred, since it contains at least the necessary point of departure for the truth. The other side, holding to the existence, which is utterly at variance with the conception, has in it nothing reasonable or right at all. The standpoint of the free will, with which right and the science of right begin, is already beyond the wrong view that man is simply a natural being, who, as he cannot exist for himself, is fit only to be enslaved. This untrue phenomenon had its origin in the circumstance that the spirit had at that time just attained the level of consciousness. Hence through the dialectical movement of the conception arises the first inkling of the consciousness of freedom. There is thus by this movement brought to pass a struggle for recognition, and, as a necessary result, the relation of master and slave. But in order that the objective spirit, which gives substance to right, may not again be apprehended only on its subjective side, and that it may not again appear as a mere unsupported command, intimating that man in his real nature is not appointed to slavery, it must be seen that the idea of freedom is in truth nothing but the state. Addition. If we hold fast to the side that man is absolutely free, we condemn slavery. Still it depends on the person's own will, whether he shall be a slave or not, just as it depends upon the will of a people whether or not it is to be in subjection. Hence slavery is a wrong not simply on the part of those who enslave or subjugate, but of the slaves and subjects themselves. Slavery occurs in the passage from, the natural condition of man to his true moral and social condition. It is found in a

world where a wrong is still a right. Under such a circumstance the wrong has its value and finds a necessary place.

58. (g) The kind of possession, which is not literal but only representative of my will, is a mark or symbol, whose meaning is that it is I who have put my will into the object. Owing to the variety of objects used as signs, this kind of possession is very indefinite in its meaning. Addition. Of all kinds of possession this by marking is the most complete, since the others have more or less the effect of a mark. When I seize or form an object, in each case the result is in the end a mark, indicating to others that I exclude them, and have set my will in the object. The conception of the mark is that the object stands not for what it is, but for what it signifies. The cockade, e.g., means citizenship in a certain state, although its colour has no connection with the nation, and represents not itself but the nation. In that man acquires possession through the use of a sign, he exhibits his mastery over things. B. Use of the Object.

59. The object taken into my possession receives the predicate "mine," and the will is related to it positively. Yet in this identity the object is established as something negative, and my will becomes particularized as a want or desire. But the particular want of one separate will is the positive, which satisfies itself; while the object is negative in itself, and exists only for my want and serves it. Use is the realization of my want through the change, destruction, or consumption of the object, which in this way reveals that it has no self, and fulfils its nature. Note. The view that use is the real nature and actuality of property floats before the mind of those who consider that property is dead and ownerless, if it is being put to no use. This they advance as reason for laying violent and unlawful hands upon property. But the will of an owner, by virtue of which a thing is his own, is the fundamental principle, of which use is only an external, special, and subordinate manifestation. Addition. In use is involved a wider relation than

in possession by symbol, because the object, when used, is not recognized in its particular existence, but is by me negated. It is reduced to a means for the satisfaction of my wants. When the object and I come together, one of the two must lose its qualities, if we are to become identical. But I am a living thing who wills and truly affirms himself, while the object is only a natural thing. Therefore it must go to ground and I preserve myself. This constitutes the superiority and reason of the organic world.

60. Using an object in direct seizure is a single separate act. But when we have a recurring need, use repeatedly a product which replaces itself, and seek to preserve its power to replace itself, a direct and single act of seizure becomes a sign. It is universalized and denotes the possession of the elemental or organic basis, the conditions of production.

61. A thing has in contrast with me, its possessor, no end of its own (§42). Its substance as an independent thing is thus a purely external and unsubstantial existence. As this externality when realized is the use, to which I put it, so the total use or service of the object is the object itself in its whole extent. When I am admitted to the complete use of a thing, I am the owner of it. Apart from the entire range of use, nothing is left over to be the possession of another. Addition. The relation of use to property is the same as that of substance to accident, of internal to external, of force to its manifestation. But the force must be manifested; a farm is a farm only as it bears produce. He who has the use of a farm is the possessor of the whole, and to suppose another ownership in addition is an empty abstraction.

62. Partial or temporary use, and partial or temporary possession, or possibility of use, however, are to be distinguished from actual ownership. The total use of a thing cannot be mine, while the abstract property is somebody else’s. The object would in that case contain a contradiction. It would be wholly penetrated by my will and yet contain something impenetrable, namely, the empty will of another. The relation of my positive

will to the thing would be objective and yet not objective. Accordingly, possession is essentially free and complete. Note. The distinction between right to total use and abstract possession is due to the empty and formal understanding. To it the idea, which in this case is the unity of possession or the personal will with the realization of this will, is not true. On the contrary, it holds as true these two elements in their separation. This distinction of the understanding implies that an empty mastership of things is an actual relation. If we could extend the term "aberration" beyond the mere imagination of the subject, and the reality, with which he is directly at variance, we might call such a view of property an aberration of personality. How can what is mine in one single object be without qualification my individual exclusive will, and also the individual exclusive will of someone else? In the "Institut." libr. ii. tit. iv. it is said: "Usufructus est jus alienis rebus utendi, fruendi salva rerum substantia," and again: "Ne tamen in universum inutiles essent pro-prietates, semper abscendente usufructu: placuit certis modis extingui usumfructum et ad proprietatem reverti." "Placuit" — as though it were optional, whether or not to give sense to the formal distinction of the understanding. A pro-prietas semper abscendente usufructu would not only be inutiles, but no longer a proprietas. Many distinctions regarding property, such as that into res mancipi and nec mancipi, and that into dominium Quiritarium and Bonitarium, are merely historical dainties and do not belong to this place, because they have no relation to the conception of property. But the relation of the dominium directum to the dominium utile, and that of the contract which gives heritable right in another's land, and also the various ways of dealing with estates in fee, with their ground rents and other rents and impositions, have a clear bearing upon the distinction now under discussion. When these charges are irredeemably imposed, this formal distinction is indeed present, but it is again transcended when by the association of certain charges with

the dominium utile, the dominium utile and the dominium directum become the same. If these relations contained no more that the formal distinction of the understanding, there would be opposed to each other not two masters (domini), but an owner and an empty master. But by virtue of the charges or taxes it is two owners, who stand in relation to each other, though they are not related by a common possession. In this relation is to be found the transition from property to use, a transition already operating when ownership, which was formerly reckoned as the more honourable, is given a secondary place, while the utile or produce of a dominium directum is regarded as the essential and rational. It is fully fifteen hundred years since through the influence of Christianity the freedom of the person began to flourish, and at least in a small section of the human race take rank as a universal principle. But the recognition here and there of the principle of the freedom of property is, as it were, a thing of yesterday. This is a good illustration from world history, of the length of time needed by the spirit to reach self-consciousness, and is a rebuke also to the impatience of opinion.

63. In use the object is a single one, definite in quality and quantity, and answers to a special need. But its special usefulness, when fixed quantitatively, can be compared with other objects capable of being put to the same use, and a special want, served by the object, and indeed any want may be compared with other wants; and their corresponding objects may be also compared. This universal characteristic, which proceeds from the particular object and yet abstracts from its special qualities is the value. Value is the true essence or substance of the object, and the object by possessing value becomes an object for consciousness. As complete owner of the object, I am owner of its value as well as of its use. Note. The feudal tenant is the owner of use only, not of the value. Addition. Quality here becomes quantity. Want is a term common to the greatest variety of things, and enables me to compare them. Thought in its progress starts from the

special quality of an object, passes through indifference with regard to the quality, and finally reaches quantity. So in mathematics the circle, ellipse and parabola are specifically different, and yet the distinction of one curve from another is merely quantitative, being reduced to a mere quantitative difference in the largeness of their coefficients. In property the quantitative aspect, which issues from the qualitative, is value. The qualitative determines the quantum, however, and is therefore quite as much retained as superseded. When we consider the conception of value, the object is regarded only as a sign, counting not for what it is but for what it is worth. A letter of credit, e.g., is not a kind of paper, but a sign of another universal, namely, its face value. The specific value of an object varies according to the want, but in order to express abstract worth, we use money. Money represents things, but since it does not represent want itself, but is only a sign of it, it is again governed by the specific value, which it merely stands for. One can be owner of an object without being master of its value. A family, which can neither sell nor pawn its goods, is not master of their value. But since the restrictions characterizing this form of property, such as fiefs, property conveyed in trust, etc., are not adequate to the conception of it, they are largely disappearing.

64. The form of the object and the mark are themselves external circumstances, deprived of meaning and worth if taken apart from use, employment, or some such manifestation of the subjective will. The presence of the will, however, is in time, and its objective reality is continuance of the subjective manifestation. If the manifestation lapses, the object, abandoned by the real essence of the will and of possession, becomes ownerless. Hence I may lose or acquire property through prescription. Note. Prescription does not run counter to strict, right and is not introduced into law merely to cut short the strife and confusion, which would naturally arise out of old claims. It is founded on the reality of

property, in other words upon the necessity that the will, in order to keep a thing, must manifest itself in it. Public monuments are property of the nation, or rather they, like all works of art intended for use, are living and self-sufficient ends because of their indwelling soul of remembrance and honour. Deprived of this soul they are, so far as the nation is concerned, without a master, and become casually a private possession, as has happened with the Greek and Egyptian works of art in Turkey. The private right of an author's family to his works is prescribed for similar reasons. These works become in a sense masterless, since they, like the monuments, though in an opposite way, become first common property, and then through various channels, private property. To set apart land for a cemetery and then not use it, or to set apart land never to be used, contains an empty unreal caprice. As to traverse this action does no injury, respect for it cannot be guaranteed. Addition. Prescription rests upon the supposition that I have ceased to look upon the object as mine. If a thing is to remain mine, there must be a continuous act of will, and this act reveals itself through use or preservation. The decline in the value of public monuments was frequently illustrated during the Reformation in institutions founded for the saying of masses. The spirit of the old confession and therefore of these buildings had fled, and the buildings could be taken as private property. C. Relinquishment of Property.

65. I may relinquish property, since it is mine only by virtue of my having put my will into it. I may let a thing go unowned by me or pass it over to the will and possession of another; but this is possible only so far as the object is in its nature something external. Addition. Prescription is relinquishment without direct declaration of will. True relinquishment is a declaration that I will no longer regard the object as mine. The process in all its phases may be taken to be a true taking of possession. First there is the

direct prehension; then by use property is thoroughly acquired; and the third step is the unity of both these elements, possession through relinquishment.

66. Some goods, or rather substantive phases of life are inalienable, and the right to them does not perish through lapse of time. These comprise my inner personality and the universal essence of my consciousness of myself, and are personality in general, freedom of will in the broadest sense, social life and religion. Note. What the spirit is in conception, or implicitly, it should also be in actuality; it should be a person, that is to say, be able to possess property, have sociality and religion. This idea is itself the conception of spirit. As causa sui, or free cause, it is that, cujus natura non potest concipi nisi existens (Spinoza, "Eth." Def. 1). In this very conception, namely, that spirit shall be what it is only through itself and by the infinite return into itself out of its natural and direct reality, lies the possibility of opposition between what it is only implicitly (§57), and what it is only explicitly. In the will this opposition is the possibility of evil, but in general it is the possibility of the alienation of personality and substantive being; and this alienation may occur either unconsciously or intentionally. — Examples of the disposal of personality are slavery, vassalage, inability to own property or lack of complete control over it. Relinquishment of reason, sociality, morality or religion occurs in superstition; it occurs also if I delegate to others the authority to prescribe for me what kind of acts I shall commit, as when one sells himself for robbery, murder, or the possibility of any other crime; it occurs when I permit others to determine what for me shall be duty or religious truth. The right to nothing that is inalienable can be forfeited through lapse of time. The act by which I take possession of my personality and real being, and establish myself as having rights, responsibilities, and moral and religious obligations, deprives these attributes of that externality, which alone gives them the capacity of being possessed by another. Along with the departure of this externality goes the

reference to time or to any previous consent or complaisance. This return of myself into myself, being the process by which I establish myself as idea or complete legal and moral person, does away with the old relation. It removes the violence which I and others had done to my own conception and reason, the wrong of having treated the infinite existence of self-consciousness as something merely extraneous, and of having suffered others to do the same. This return into myself reveals the contradiction implied in my having given into the keeping of others my right, morality or religion. I gave them what I did not myself possess, what, so soon as I do possess it, exists in essence only as mine, and not as something external. Addition. It lies in the nature of the matter that the slave has an absolute right to make himself free, or that, when anyone has hired out his morality for robbery and murder, the transaction is absolutely void. Anyone possesses the competency to annul such an agreement. It is the same with the letting of religiosity by a priest, who is my confessor. The inner religious condition every one must adjust by himself. A religiosity, part of which is handed over to some one else is not genuine, for the spirit is only one, and must dwell within me. To me it must belong to unite the act of worship with religious aspiration.

67. The use of single products of my particular physical endowments or mental capacities I may hand over to others for a limited time, since, when a time limit is recognized, these products may be said to have an external relation to my genuine and total being. If I were to dispose of my whole time, made concrete in work, and all my activity, I would be giving up the essence of my productions. My whole activity and reality, in short, my personality, would be the property of another. Note. This is the same relation as that (§61) between the substance of an object and its use. As it is only by limiting use that we can distinguish it from the object, so the use of my powers is to be distinguished from these powers themselves, only in so

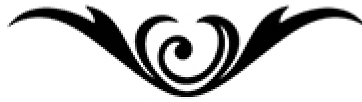
far as it has a quantitative limit. The total number of manifestations of a faculty is the faculty; the accidents are the substance; the particulars, the universal. Addition. The distinction, here analyzed, is that between a slave and a servant or day-labourer in our own time. The Athenian slave had possibly lighter occupation and higher kind of mental work than is the rule with our workmen. But he was a slave notwithstanding, since the whole circle of his activity was controlled by his master.

68. What is peculiar to a mental product can be externalized and directly converted into an object, which it is possible for others to produce. When another person has acquired the object, he may make the thought or, it may be, the mechanical genius in it, his own; a possibility which in the case of literary works constitutes the reason and special value of acquisition. But, over and above this, the new owner comes at the same time into possession of the general power to express himself in the same way, and so of making any number of objects of the same kind. Note. In works of art the form, which images the thought in an external material, is so conspicuously the possession of the artist, that an imitation of it is really a product of the imitator's mental and mechanical skill. But in the case of literature or an invention of some technical contrivance, the form in which it is externalized is of a mechanical sort. In a book the thought is presented in a row of particular abstract signs; in an invention the thought has a wholly mechanical content. The way to reproduce such things, as mere things, is a matter of ordinary skilled labour. Between the two extremes, on the one side a work of art, and on the other a product of manual labour, there are all stages of production, some of which incline to one of the extremes, some to the other.

69. Since the purchaser of such a product of mental skill possesses the full use and value of his single copy, he is complete and free owner of that one copy, although the author of the work or the inventor of the apparatus

remains owner of the general method of multiplying such products. The author or inventor has not disposed directly of the general method, but may reserve it for his private utterance. Note. The justification of the right of the author or inventor cannot be sought in his arbitrarily making it a condition, when he disposes of a copy, that the possibility of bringing out other copies shall not belong to the purchaser, but shall remain in his own hands. The first question is whether the separation of the object from the power to reproduce, which goes with the object, is allowable in thought, and does not destroy full and free possession (§62). Does it depend upon the arbitrary choice of the first producer to reserve to himself the power to reproduce or dispose of the product of his mind? Or, on the other hand, may he count it of no value, and give it freely with each separate copy? Now there is this peculiarity about this power, that through it the object becomes not merely a possession, but a means of wealth (see §170, and fol.). This new feature is a special kind of external use, and is different and separate from the use to which the object was directly appointed. It is not, as it is called, an accessio naturalis as are foetura. Hence as the distinction occurs in the sphere of external use, which is naturally capable of being divided, the reservation of one part, while another is being disposed of, is not the retention of an ownership without utile. The primary and most important claim of trade and commerce is to give them surety against highway robbery. In the same way the primary though merely negative demand of the sciences and arts is to insure the workers in these fields against larceny, and give their property protection. But in the case of a mental product the intention is that others should comprehend it, and make its imagination, memory, and thought their own. Learning is not merely the treasuring up of words in the memory; it is through thinking that the thoughts of others are seized, and this after-thinking is real learning. Now that which is learned becomes in turn something which can be disposed of; and the external expression of this

material may easily assume a form different from the form into which the original thinker threw his work. Thus those who have worked over the material a second time may regard as their own possession whatever money they may be able to extract from their work, and may contend that they have a right to reproduce it. In the transmission of the sciences in general, and especially in teaching positive science, church doctrine, or jurisprudence, are found the adoption and repetition of thoughts which are already established and expressed. This is largely the case with writings composed for the same purpose. It is not possible to state accurately, and establish explicitly by law and right, just how far the new form, which accrues through repeated expression, should transmute the scientific treasure or the thoughts of others, who are still in external possession, into a special mental possession of the person who re-constructs them; how far, in other words, a repetition of an author's work should be called a plagiarism. Hence plagiarism must be a question of honour, and should be refrained from on that score. Laws against reprinting protect the property of author and publisher in a very definite but, indeed, limited measure. The ease with which one can intentionally alter the form or insert slight modifications into a large work on science or a comprehensive theory which is the work of another, and further, the great difficulty, when discoursing on what one has received, of abiding by the letter of the author, introduce, in addition to the special purposes requiring such a repetition, an endless variety of changes, which stamp upon the foreign article the more or less superficial impression of something which is one's own. The hundreds of compendiums, abridgments, compilations, arithmetics, geometries, religious tracts, every venture of a critical journal, an annual, or a cyclopaedia, keep on repeating under the same or an altered title, although each may be maintained to be something new and unique. Yet the profit which the work promised the author or inventor in the first place may be wiped out, or the purpose of



both author and imitator may be defeated, or one may be ruined. It is noteworthy that the term plagiarism, or scholar's larceny is no longer heard. It may be that the principle of honour has dislodged it, or that the feeling of honour has vanished or ceased to be directed against plagiarism, or that a small compilation or slight change of form is ranked as an original and independent production, and so highly esteemed as to banish all thought of plagiarism.

70. Since personality is something directly present, the comprehensive totality of one's outer activity, the life, is not external to it. Thus the disposal or sacrifice of life is not the manifestation of one's personality so much as the very opposite. Hence I have no right to relinquish my life. Only a moral and social ideal, which submerges the direct, simple and separate personality, and constitutes its real power, has a right to life. Life, as such, being direct and unreflected, and death the direct negation of it, death must come from without as a result of natural causes, or must be received in the service of the idea from a foreign hand. Addition. The particular person is really a subordinate, who must devote his life to the service of the ethical fabric; when the state demands his life, he must yield it up. But should the man take his own life? Suicide may at first glance be looked upon as bravery, although it be the poor bravery of tailors and maid-servants. Or it may be regarded as a misfortune, caused by a broken heart. But the point is, Have I any right to kill myself? The answer is that I, as this individual am not lord over my life, since the comprehensive totality of one's activity, the life, falls within the direct and present personality. To speak of the right of a person over his life is a contradiction, since it implies a right of a person over himself. But no one can stand above and execute himself. When Hercules burnt himself, and Brutus fell upon his sword, this action against their personality was doubtless of an heroic type; but yet the simple right to

commit suicide must be denied even to heroes. Transition from Property to Contract.

71. Outward and visible existence, as definite, is essentially existence for another thing (see note to §48). Thus property, as a visible external thing, is determined by its relations to other external things, these relations being both necessary and accidental. But property is also a manifestation of will, and the other, for which it exists, is the will of another person. This reference of will to will is the true and peculiar ground on which freedom is realized. The means by which I hold property, not by virtue of the relation of an object to my subjective will, but by virtue of another will, and hence share in a common will, is contract. Note. It is just as much a necessity of reason that men make contracts, exchange, and trade, as that they should have property (§45, note). In their consciousness it is some want, benevolence, or advantage, which occasions the contract, but really it is reason, or the idea as it is embodied in the realized will of a free person. It is taken for granted that contracting parties recognize one another as persons and owners. Recognition is contained and presupposed in the fact that contract is a relation of the objective spirit (§35, note to §57). Addition. In contract I hold property through a common will. It is the interest of reason that the subjective will become universal, and exalt itself to this level of realization. In contract the particular will remains, although it is now in conjunction with another will. The universal will assumes here no higher form than co-operation.

Second Section: Contract.

72. In contract property is no longer viewed on the side of its external reality, as a mere thing, but rather as containing the elements of will, another's as well as my own. Contract is the process which presents and occasions the contradiction by which I, existing for myself and excluding another will, am and remain an owner only in so far as I identify myself with the will of another, and cease to be an owner.

73. Guided by the conception I must relinquish my property not merely as an external thing (§65), but as property, if my will is to become a genuine factor in reality. But by virtue of this procedure my will, when relinquished, is another will. The necessary nature of the conception is thus realized in a unity of different wills, which, nevertheless, give up their differences and peculiarities. But this identity implies not that one will is identical with the other, but rather that each at this stage remains an independent and private will.

74. For two absolutely distinct and separate owners there is now formed one will. While each of them ceases to be an owner through his own distinct will, the one will remains. Each will gives up a particular property, and receives the particular property of another, adopting only that conclusion with which the other coincides.

75. Since the two contracting parties appear as directly independent persons (a) contract proceeds from arbitrary choice; (b) the one will formed by the contract is the work merely of the two interested persons, and is thus a common, but not an absolutely universal will; (g) the object of the contract is a single external thing, because only such a thing is subject to relinquishment at their mere option (§65 and fol.). Note. Marriage does not

come under the conception of contract. This view is, we must say it, in all its shameless-ness, propounded by Kant ("Metaph. Anf. der Rechtslehre," p. 106). Just as little does the nature of the state conform to contract, whether the contract be regarded as a compact of all with all, or of all with the prince or government. The introduction of the relations of contract and private property into the functions of the state has produced the greatest confusion both in the law and in real life. In earlier times civil rights and duties were thought and maintained to be a directly private possession of particular individuals in opposition to the rights of prince and state. In more recent years, also, the rights of prince and state have been treated as objects of covenant. They are said to be based on contract, or the mere general consent of those who wish to form a state. Different as these two views of the state are, they agree in taking the phases of private property into another and a higher region. This will be referred to again when we come to speak of ethical observances and the state. Addition. It is a popular view in modern times that the state is a contract of all with all. All conclude, so the doctrine runs, a compact with the prince, and he in turn with the subjects. According to this superficial view, there is in contract only one unity of different wills; but in fact there are two identical wills, both of which are persons, and wish to remain possessors. Contract, besides, arises out of the spontaneous choice of the persons. Marriage, indeed, has that point in common with contract, but with the state it is different. An individual cannot enter or leave the social condition at his option, since every one is by his very nature a citizen of a state. The characteristic of man as rational is to live in a state; if there is no state, reason claims that one should be founded. A state, it is true, must grant permission either to enter or to leave it; but this permission is not given in deference to the arbitrary choice of the individual, nor is the state founded upon a contract which presupposes this choice. It is false to say that it rests with the arbitrary will of all to establish

a state; rather is it absolutely necessary for every one to be in a state. The great progress of the modern state is due to the fact that it has and keeps an absolute end, and no man is now at liberty to make private arrangements in connection with this end, as they did in the middle ages.

76. Contract is formal when the two elements through which the common will arises, the negative disposal of the thing and the positive reception of it, are so divided, that one of the contracting parties makes one side of the agreement, and the other, the other. This is gift. Contract is real when each of the contractors performs both sides of the double agreement, and is and remains an owner. This is exchange. Addition. Contract involves two agreements to two things; I both give up and acquire a property. Real contract occurs, when each yields up and acquires possession; in giving up he remains an owner. Formal contract occurs when a person only gives up or acquires.

77. In real contract every one both keeps the same property as he had when he undertook the contract, and also yields up his property. Hence it is necessary to distinguish the property, which in contract remains permanently mine, from the external objects which change hands. The universal and self-identical element in exchange, that with regard to which the objects to be exchanged are equal, is the value (§63). Note. By the very conception of contract a Iaesio enormis annuls the agreement, since the contractor, in disposing of his goods, must remain in possession of a quantitative equivalent. An injury may fairly be called enormous, if it exceeds half of the value; but it is infinite, when a contract or any stipulation is entered into to dispose of an inalienable good (§66). A stipulation is only one single part or side of the whole contract, or a merely formal settlement, of which more hereafter. It contains only the formal phase of contract, the consent of one party to perform something, and the consent of the other party to accept the performance. It must, therefore, be

classed amongst the so-called onesided contracts. The division of contracts into one-sided and two-sided, and many other divisions of the same kind in Roman law, are superficial combinations, arising from some particular and external consideration, as, for instance, the way in which they are made. They may also introduce attributes which do not concern the nature of contract, such as those which have meaning only in reference to the administration of justice (actiones), and to the legal consequences of positive laws, or such as may arise out of wholly external circumstances and injure the conception of right.

78. The distinction between property and possession between the substantive and the external side (§45), assumes in contract the form of a distinction between the common will or agreement and the realization of this will in performance. The agreement, taken by itself in its difference from performance, is something imagined or symbolic, appearing in reality as a visible sign. ("Encyclopaedia of the Philosophical Sciences".) In stipulation it may be manifested by gesture or other symbolic act, but usually in an express declaration through speech, which is the most worthy vehicle of thought. Note. Stipulation, thus interpreted, is the form in which the content of a concluded contract is outwardly symbolized. But this symbol is only the form. By this is not meant that the content is still merely subjective, merely a desideratum, but that the conclusion of the actual arrangement is made by the will. Addition. As in property we had the distinction between property and possession, the substantive and the external, so in contract we have the difference between the common will as agreement and the particular will as performance. It is in the nature of contract that both the common and the particular wills should be manifested, because it is the relation of will to will. In civilized communities agreement, manifested by a sign, is separated from performance, although with ruder peoples they may concur. There is in the

forests of Ceylon a tribe, which in trading puts down its property and waits patiently for the arrival of those who will place their property over against it; the dumb declaration of the will is not separated from performance.

79. As stipulation involves the will, it contains, from the standpoint of right, the substance of contract. In contrast with this substantive contract the possession, which remains till the contract is fully carried out, has no reality outside of the agreement. I have given up a possession and my private control over it, and it has already become the property of another. I am legally bound to carry out the stipulation. Note. Mere promise is different from contract. What I promise to do, give or perform, is future and a mere subjective qualification of my will. I am at liberty to change my promise. But stipulation is already the embodiment of my volition. I have disposed of my property; it has ceased to be mine, and I recognize it as already belonging to another. The Roman distinction between pactum and contractus is not sound. Fichte once laid it down that the obligation to hold to the contract began for me only when the other party began to do his share. Before performance I am supposed to be doubtful whether the other had been really in earnest. The obligation before performance is, therefore, said to be moral and not legal. The trouble is that stipulation is not merely external, but involves a common will, which has already done away with mere intention and change of mind. The other party may of course change his mind after the engagement, but has he any right to do so? For plainly I may choose to do what is wrong, although the other person begins to perform his side of the contract. Fichte's view is worthless, since it bases the legal side of contract upon the bad infinite, that is, an infinite series, or the infinite divisibility of time, material and action. The embodiment of the will in gesture or a definite form of words is its complete intellectual embodiment, of which the performance is the merely mechanical result. It does not alter the case that positive law distinguishes between so-called real

contracts and consensual contracts, real contracts being complete only when the actual performance (res, traditio rei) is added to consent. Sometimes in these real contracts the surrender to me of the object enables me to carry out my part of the engagement, and my obligation to act refers to the object only in so far as I have received it into my hands. This occurs in loan, interest, deposit, and sometimes in exchange also. These cases do not concern the relation of stipulation to performance, but merely the manner of performance. It is also optional in the case of contract to bargain that on one side the obligation shall not arise until the other party fulfils his share of the engagement.

80. The classification or rational treatment of contracts is deduced not from external circumstances, but from distinctions which are involved in the very nature of contract. These distinctions are those between formal and real contract, between property and possession or use, and between value and the specific thing. The subjoined classification agrees in the main with the Kantian ("Metaphysical Principles of the Theory of Right," p. 120). It is surprising that the old method of classification of contracts into real and consensual, named and unnamed, has not long ago given way before something that is more reasonable. A. Gift. (1) Gift of an object or gift proper. (2) Loan of an object — the gift of a portion of it or of a partial use or enjoyment of it, the lender remaining owner; (mutuum and commodatum without interest). The object is specific, or it may be regarded as universal, or it is, as in the case of money, actually universal. (3) Gift of service, as for example the mere storage of a property (depositum). The gift of an object on the special condition that the receiver shall be owner on the giver's death, when the giver can no longer be owner, is bequest, and does not come under the conception of contract. It presupposes the civic community and positive legislation. B. Exchange. (1) Exchange as such. (a) Exchange of objects, i.e. of one specific thing for another of the same kind. (b)

Purchase or sale (emtio, venditio). The exchange of a specific object, for a general object, which has the phase of value but not of use, namely money. (2) Rent (locatio, conductio), relinquishment of the temporary use of a property for rent or interest, (a) Renting of a specific thing, renting proper. (b) Renting of a universal thing, so that the lessor remains owner only of the universal or the value. This is loan, mutuum and commodatum with interest. Whether the object be a flat, furniture, house, a res fungibilis or non fungibilis, this question gives rise, here also as in the second kind of gift, to particular qualifications that are unimportant. (3) Contract for wages (locatio operae) — relinquishment, limited in time or otherwise, of my labour or services, in so far as as they are disposable (§67). Akin to this is the brief and other such contracts, in which the performance depends upon character, confidence, or special talents. Here the service cannot be measured by its money value, which is not called wages, but an honorarium or fee. C. Completion of a contract (cautio) through a security. In contracts where I dispose of the use of a thing, as in rent, I am no longer in possession of it, but am still the owner. In exchange, purchase, or gift, I may have become owner, without being as yet in actual possession. Indeed, in every contract, except such as are directly on a cash basis, this separation is to be found. Security or pledge is concerned with an object which I give up, or an object which is to be mine. It either keeps or puts me in actual possession of the value, although in neither case am I in possession of the specific thing. The thing which I have either given up, or expect to receive, is my property only as regards its value; but as a specific thing it is the property of the holder of the pledge, who owns also whatever surplus value the object may have. Pledge is not itself a contract, but only a stipulation (§77), which completes contract on the side of possession of property. Mortgage and surety are special forms of the pledge. Addition. In contract it was said that by means of an agreement a property becomes mine, although

I have not possession as yet and shall have possession only by performing my part. If I am out-and-out owner of the object, the intention of a pledge is to place me at once in possession of its value; thus already in the engagement the possession is guaranteed. Surety is a special kind of pledge, some one offering his promise or credit as warrant for my performance. Here a person does, what in a pledge is done by a thing.

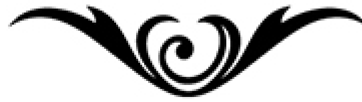
81. When persons are viewed as direct and incomplete, their wills are still particular, however identical they may be implicitly, and however much they may, in contract, be subordinated to the common will. So long as they are direct and incomplete, it is a matter of accident whether their particular wills accord with the general will, which has existence only by means of them. When the particular will is actually different from the universal, it is led by caprice, random insight and desire, and is opposed to general right. This is wrong. Note. It is from the standpoint of logic a higher necessity which brings about the transition to wrong. The two phases of the conception of right are (a), intrinsic right or the general will, and (b) right as it exists, or the particular will. It inheres in the abstract reality of the conception that these two phases should be opposed and given independence. The particular, independent will is caprice and erratic choice, which I, in exchange, have yielded up with regard to only one single thing, but not altogether. Addition. In contract the two wills give rise to a common will. This common will is only relatively universal, and thus still in opposition to the particular will. Exchange or covenant, it is true, implies the right to demand performance. But the particular will may act in opposition to the general abstract right. Hence arises the negation, which was already implicit in the general will. This negation is wrong. The general procedure is this, to purify the will of its abstract simplicity, and thus to summon out of the common will the particular will, which in turn takes the field against the common will, the participants, in contract, still preserve

their particular wills. Contract is not, therefore, beyond arbitrary caprice, and remains exposed to wrong.

Third Section: Wrong.

82. CONTRACT ESTABLISHES general right, whose inner or relative universality is merely a generality based on the caprice of the particular will. In this external manifestation of right, right and its essential embodiment in the particular will are directly or accidentally in accord. In wrong this external manifestation becomes an empty appearance. This seeming reality consists in the opposition of abstract right to the particular will, involving a particular right. But this seeming reality is in truth a mere nullity, since right by negating this negation of itself restores itself.By turning back to itself out of its negation right becomes actual and valid, whereas at first it was only a contingent possibility. Addition. When intrinsic right or the general will is determined in its nature by the particular will, it is in relation with a non-essential. This is the relation of essence or reality to outward manifestation. Though the manifestation is in one aspect adequate to the essence, it is in another aspect inadequate; as a manifestation is contingency, essence is in relation with the unessential. Now in wrong this manifestation has the form of a seeming reality, which is to be interpreted as an outward reality inadequate to the essence. It deprives essence of reality, and sets up the empty abstraction as real. It is consequently untrue. It vanishes when it tries to exist alone. By its departure the essence is in possession of itself as its reality, and becomes master over mere semblance. It has thus negated the negation of itself, and become strengthened in the process. Wrong is this mere seeming reality, and, when wrong vanishes, right receives an added fixity and value. What we call essence or reality is the intrinsically universal will, as against which the particular will reveals itself as untrue, and does away with itself. The

general will had in the first instance only an immediate being; but now it is something actual, because it has returned out of its negation. Actuality is active and finds itself in its opposite, while the implicit is to its negation passive.



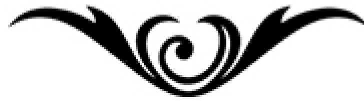
83. Right, as particular and in its diverse shapes, is opposed to its own intrinsic universality and simplicity, and then has the form of a mere semblance. It is a mere seeming reality partly of itself and directly; partly is it so by means of the subject; partly is it established as a pure nullity. There arise therefore (a) unpremeditated or civic wrong, (b) fraud, and (c) crime. Addition. Wrong is the mere outer appearance of essence, giving itself forth as independent. If this semblance has a merely implicit and not an explicit existence, that is to say, if the wrong is in my eyes a right, the wrong is unpremeditated. The mere semblance is such for right but not for me. The second form of wrong is fraud. Here the wrong is not such for general right, but by it I delude another person; for me the right is a mere semblance. In the first case wrong was for right only a semblance or seeming wrong; in the second case right is for me, the wrongdoer, only a semblance or pretence. The third kind of wrong is crime. This is both of itself and also for me a wrong. I in this case desire the wrong, and make no use of the pretence of right. The other party, against whom the crime is done, is quite well aware that this unqualified wrong is not a right. The distinction between fraud and crime lies in this, that a fraudulent act is not yet recognized as a wrong, but in crime the wrong is openly seen. A. Unpremeditated Wrong.

84. Since the will is in itself universal, possession (§54) and contract, in themselves and in their different kinds, and also all the various manifestations of my will imply a reference to other rights at law. Since these rights are so external and varied, several different persons may have a right to one and the same object, each basing his claim to ownership on his right at law. Thus arise collisions.

85. A collision, in which the object is claimed on legal grounds, occurs in the region of civil law, and recognizes the law as the universal arbiter. The thing is admitted to belong to him who has the right to it. The legal contest merely finds whether a thing is mine or another's. This is a purely negative judgment, in which the predicate "mine" negates only the particular.

86. In law-suits the recognition of right is bound up with some private interest or view opposed to right. Against this mere appearance, intrinsic right, which is in fact implied in it (§85), comes on the scene as a reality purposed and demanded. This right, however, is demanded only abstractly, because the will as particular is not freed from direct contact with its private interest, and does not aim at the universal. Still, the law is here a recognized reality, as against which the contending parties must renounce their private views and interests. Addition. That which is intrinsically right has a definite ground, and I defend my wrong, which I maintain to be right, also on some ground. It is the nature of the finite and particular to make room for accidents. Collisions must occur, since we are at the stage of the finite. The first form of wrong negates only the particular will; but pays respect to the general right; it is thus the slightest of all forms of wrong. When I say that a rose is not red, I still admit that the object has colour. I thus do not deny the species, colour, but only the particular colour, red. It is the same here with right. Everybody wills the right, and for him the right only shall take place; his wrong consists in his holding that what he wills is right.

B. Fraud.



87. SINCE INTRINSIC right, in distinction from particular and concrete right, is demanded, it is essential; but just because it is only demanded and in that light merely subjective, it is non- essential, and becomes simply an appearance. When the universal is degraded from the particular will to the merely apparent will, when, e.g., contract is regarded as only an external association of the will, we have fraud. Addition. In fraud universal right is abused, but the particular will is respected. The person on whom the fraud is committed, is imposed upon and made to believe that he gets his rights. The right, which is demanded, however, is merely subjective and unreal, and in that consists the fraud.

88. I acquire property by contract for the sake of the special qualities of the thing. But I acquire it, also, because of its inner universality which consists partly in its value, partly in its being the property of another. Now it is at the option of the other party to produce a false appearance in the case of contract. There may be the free consent of both parties to the exchange of the mere given object in its bare particularity, and so far the transaction is not unjust. Yet the object may fail to have any intrinsic universality. (The infinite judgment in its positive expression or identical meaning. See "Encyclopaedia of the philosophical Sciences.")

89. To guard against the acceptance of a thing in its bare particularity, and in order to be fortified against an arbitrary will, there is at this juncture only a demand that the objective or universal side of the thing should be recognizable, that the objective should be made good as right, and that the arbitrary will, offending against right, should be removed and superseded. Addition. No penalty is attached to mere unpremeditated or unintentional

wrong, since in it I have willed nothing against right. But to fraud penalties are due, since right is violated.

C. Violence and Crime.

90. SINCE IN property my will is embodied in an external thing, it follows that just as far as my will is reflected in that object, I can be attacked in it and placed under external compulsion. Hence my will may be enforced. Violence is done to it, when force is employed in order to obtain some possession or object of desire. Addition. In crime, which is wrong in its proper sense, neither right in general nor my personal right is respected. Both the objective and the subjective aspects of right are set at defiance by crime.

91. As a living creature a man may be compelled to do a thing; his physical and other external powers may be brought under the force of another. But the free will cannot be absolutely compelled (§5), but only in so far as it does not withdraw (§7) out of the external, to which it is held fast, or out of the imaginative reproduction of the external. It can only be compelled when it allows itself to be compelled.

92. Since it is only in so far as the will has visible existence that it is the idea and so really free, and its realized existence is the embodiment of freedom, force or violence destroys itself forthwith in its very conception. It is a manifestation of will which cancels and supersedes a manifestation or visible expression of will. Force or violence, therefore, is, according to this abstract treatment of it, devoid of right.

93. Since it in its very conception destroys itself, its principle is that it must be cancelled by violence. Hence it is not only right but necessary that a second exercise of force should annul and supersede the first. Note. Violation of a contract through failure to carry out the agreement, or violation of the legal duties toward the family or the state, through action or

neglect, is the first violence. It is an exercise of force, if I retain another's property, or neglect to do some duty. Force exercised by a teacher upon a pupil, or by any one against incivility and rudeness, seems to be the first act of violence, not caused by any previous display of force. But the merely natural will is of itself a violence to the universal idea of freedom; and against the inroads of the uncivilized will the idea of freedom ought to be protected and made good. Either there must be assumed within the family or state a moral and social atmosphere, against which a crude naturalness is an act of violence, or else there is at first everywhere present a natural condition or state of violence, over which the idea has the right of mastery. Addition. In the state there can be heroes no more. They appear only in uncivilized communities. The aim of the hero is right, necessary and in keeping with the state; but he carried it out, as if it was his own private affair. The heroes, who founded states, and introduced marriage and husbandry, did not in this realize a recognized right. These acts issue merely from their particular wills. Yet as they imply the higher right of the idea against a merely natural state of things, their violence is lawful. Little can be effected against the force of nature merely by goodness.

94. Abstract right is a right to use force. A wrong done to this right is a force exercised against my liberty realized in an external thing. The preservation of my realized freedom against force must be itself an external act, and therefore a second force, which removes the first and takes its place. Note. To define strict abstract right as the right to use compulsion is to apprehend it as a result, which enters first of all by the roundabout way of wrong. Addition. Here may well be observed the difference between right and morality. In morality or the sphere in which I turn back into myself there are also two sides, for in it goodness is for me an end, and in accordance with this idea I must direct my life. Goodness is embodied in my resolution, and I realize it in myself. Yet this resolution is wholly

internal, and, as a consequence, is not subject to coercion. The civil laws do not seek to stretch their control over the disposition. In morality I am independent, and the application of external force has no meaning.

95. A first violence, exercised by a free man, and doing injury to the concrete embodiment of freedom, namely right as right, is crime. Crime is the negative-infinite judgment in its complete sense. It negates not only the particular object of my will, but also the universal or infinite, which is involved in the predicate 'mine,' the very capacity for possessing rights; nor does it even utilize my opinion, as in fraud (§88). Here we are in the realm of criminal law. Note. The right, to injure which constitutes crime, has indeed so far only the features we have pointed out; and crime has a meaning determined in each case by these special features. But the substance of these forms of right is the universal which remains the same in all its subsequent developments and modifications. So also crime remains the same in accordance with its conception. Hence the phase, noticed in the next paragraph, refers to particular and definite contents, as, e.g., perjury, treason, counterfeiting, forgery, etc.

96. The actualized will, which alone is subject to injury, has, of course, a concrete existence, and varies, therefore, both in quality and in quantity. This variation gives rise to differences in the objective side of crime, which may injure only one side or phase of the will, or again, its whole concrete character and range, as in murder, slavery, and religious persecution. Note. The Stoic theory that there is but one virtue and one vice, the Draconian statutes, which punished every crime with death, and the barbarity of the formal code of honour, which found in every injury an unpardonable insult, all in common cling to the abstract view of the free will and personality, and refuse to take them in that concrete and definite realization which they must have, if they are to realize the idea. Robbery and theft differ in quality, because in robbery personal violence is done to me as an actually present

consciousness and as this selfdetermined subject. Many qualitative phases of crime, as, for instance, an act done against public safety, are determined by definite social relations, and may be deduced from the conception, although they are often made in a roundabout way to depend upon consequences. A crime against public peace is of itself in its own direct composition heavier or lighter according to its extent and quality. The subjective moral quality referring to the higher distinction, as to how far the act is done consciously, will be dealt with later. Addition. Thought itself cannot determine how every single crime is to be punished. In many cases the positive features of the act must be considered. By the progress of civilization the estimate of crime becomes milder, to-day the criminal being punished less severely than he was a hundred years ago. It is not exactly that the crime or the punishment has become different but the relation between the two.

97. An injury done to right as right is a positive external fact; yet it is a nullity. This nullity is exposed in the actual negation of the injury and in the realization of right. Right necessarily brings itself to pass by cancelling the injury and assuming its place. Addition. By crime something is altered, and exists as so altered. But this existence is the opposite of itself, and so far null. Nullity consists in the usurpation of the place of right. But right, as absolute, is precisely what refuses to be set aside. Hence it is the manifestation of the crime which is intrinsically null, and this nullity is the essential result of all crime. But what is null must manifest itself as such, and make itself known as that which violates itself. The criminal act is not the primary and positive, to which punishment comes as the negative. It is the negative, and punishment is only the negation of a negation. Actual right destroys and replaces injury, thus showing its validity and verifying itself as a necessary factor in reality.

98. Injury, confined merely to external reality or possession of some kind, is detriment or damage to property or wealth. The cancellation of the injury or damage takes, when possible, the form of civic satisfaction or compensation. Note. When damage consists in the destruction of something which cannot be restored, compensation must take the form not of a particular object but of the universal quality, namely, value.

99. The injury which befalls the intrinsic or general will, the will, that is, of the injurer, the injured and all others, has just as little positive existence in this general will as in the bare external result. The general will, i.e. right or law, is self-complete, has no external existence at all, and is inviolable. Injury is merely negative also for the particular wills of the injured and others. It exists positively, on the other hand, only as the particular will of the criminal, and to injure this will in its concrete existence is to supersede the crime, which would otherwise be positively established, and to restore right. Note. The theory of punishment is one of the matters, which in the modern positive science of right has fared worst. The attempt is made to base this theory upon the understanding, and not, as should be done, upon the conception. If crime and its removal, or, more definitely, punishment, are regarded merely as evil, it might indeed be thought unreasonable to will a second evil merely because one already existed. (Klein, "Grunds. des peinlichen Rechts," §9 fol.) In the different theories of punishment, that it is preventive, deterrent, reformatory, etc., this superficial notion is taken to be fundamental. In the same superficial way the result of punishment is set down as a good. But here we are not dealing with an evil, and this or that good, but with wrong and justice. In these superficial theories the consideration of justice is set aside, and the moral aspect, the subjective side of crime, is made the essential. Also with the moral view are mingled trivial psychological notions about temptation, and the strength of sensual impulses opposing reason, about psychological compulsion also, and the

influences affecting the imagination; it being forgotten that the subjective may freely abase itself to something contingent and unreal. The treatment of punishment in its character as a phenomenon, of its relation to the particular consciousness, of the effect of threats upon the imagination, and of the possibility of reform is of great importance in its proper place, when the method of punishment is to be decided on. But such treatment must assume that punishment is absolutely just. Hence everything turns on the point that in crime it is not the production of evil but the injury of right as right, which must be set aside and overcome. We must ask what that is in crime, whose existence has to be removed. That is the only evil to be set aside, and the essential thing is to determine wherein that evil lies. So long as conceptions are not clear on this point, confusion must reign in the theory of punishment. Addition. Feuerbach, in his theory of punishment, considers punishment as a menace, and thinks that if any one disregards the threat and commits a crime, the punishment must follow, since it was already known to the criminal. But is it right to make threats? A threat assumes that a man is not free, and will compel him by vividly presenting a possible evil. Right and justice, however, must have their seat in freedom and in the will, and not in the restriction implied in menace. In this view of punishment it is much the same as when one raises a cane against a dog; a man is not treated in accordance with his dignity and honour, but as a dog. A menace may incite a man to rebellion in order that he may demonstrate his freedom, and therefore sets justice wholly aside. Psychological compulsion may refer to distinctions of quality or quantity in crime, but not to the very nature of crime. Books of law, written in accordance with the principle that punishment is a threat, lack their proper basis.

100. The injury which the criminal experiences is inherently just because it expresses his own inherent will, is a visible proof of his freedom and is his right. But more than that, the injury is a right of the criminal himself,

and is implied in his realized will or act. In his act, the act of a rational being, is involved a universal element, which by the act is set up as a law. This law he has recognized in his act, and has consented to be placed under it as under his right. Note. Beccaria, as is well known, has denied to the state the right of exacting the death penalty, on the ground that the social contract cannot be supposed to contain the consent of the individual to his own death; rather, as he thought, must the opposite be assumed. To this it must be replied that the state is not a contract (§75), nor, moreover, are the protection and security of the life and property of individuals in their capacity as separate persons, the unconditioned object of the state's existence. On the contrary, the state is the higher existence, which lays claim to the life and property of the individual, and demands the sacrifice of them. Not only has the conception of crime, the reasonable essence of it, to be upheld by the state, with or without the consent of the individual, but rationality on its formal side, the side of the individual will, is contained in the act of the criminal. The criminal is honoured as reasonable, because the punishment is regarded as containing his own right. The honour would not be shared by him, if the conception and measure of his punishment were not deduced from his very act. Just as little is he honoured when he is regarded as a hurtful animal, which must be made harmless, or as one who must be terrified or reformed. Moreover, punishment is not the only embodiment of justice in the state, nor is the state merely the condition or possibility of justice. Addition. The desire of Beccaria that men should consent to their own punishment is reasonable, but the criminal has already yielded consent through his act. It is both in the nature of crime and in the criminal's own will, that the injury caused by him should be superseded. In spite of this Beccaria's efforts to abolish capital punishment have had good results. Although neither Joseph II nor the French have ever been able to obtain complete abolition of the death- penalty, still we have begun to see what

crimes deserve death and what do not. Capital punishment has thus become less frequent, as indeed should be the case with the extreme penalty of the law.

101. The doing away with crime is retribution, in so far as retribution is in its conception injury of an injury, implying that as crime has a definite qualitative and quantitative context, its negation should be similarly definite. This identity, involved in the very nature of the case, is not literal equality, but equality in the inherent nature of the injury, namely, its value. Note. If we were to deduce our definition of punishment, as science usually does, from accepted opinions as to the psychological experiences of consciousness, we could prove that in nations and individuals there is and has been a universal feeling that crime deserves punishment, and that it should be done to the criminal according to his act. Yet the sciences, which have drawn their decisions from universal opinion, the very next moment adopt conclusions at variance with their so-called universal facts of consciousness. The category of equality has introduced much difficulty into the general notion of retribution. The view that it is just to mete out punishment in proportion to the special context of the crime, of course arises later than the essential relation of punishment to crime. Although, in order to make this essential relation specific, we must look about for other principles than merely the general principle of punishment, yet this general principle remains as it is. And more, the conception itself must contain the basis for special applications of it. The conception, made thus specific, implies of necessity the judgment that crime, as the product of a negative will, carries with it its own negation or punishment. This inner identity is reproduced by the understanding in the sphere of actual reality as equality. The quantitative and qualitative context of crime and its removal belongs to the external region, in which no absolute rule can be laid down (compare §49). In the region of the finite this rule of equality is only a demand which,

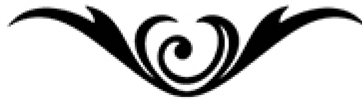
as it is important to note, the understanding must more and more hold in check. However it goes on ad infinitum, and permits only of a continual approximation. If we fail to observe the nature of the finite, and cling to absolute equality in matters of detail, there arises first of all the insuperable difficulty of fixing the kind of punishment. To do this satisfactorily psychology would have to reckon with the magnitude of the sensual motives, and also with whatever accompanies them as, e.g., the greater strength of the evil will, or the weakness of the will, or its limited freedom. But that is not the sole difficulty. To adhere obstinately to the equalization of punishment and crime in every case would reduce retribution to an absurdity. It would be necessary to institute a theft in return for theft, robbery for robbery, and to demand an eye for an eye and a tooth for a tooth, although the criminal, as we can easily fancy, might have only one eye or be toothless. For these absurdities, however, the conception is not responsible. They are due to the attempt to equate crime and punishment throughout their minute details. Value, as the inner identity of things specifically different, has already been made use of in connection with contract, and occurs again in the civil prosecution of crime (§95). By it the imagination is transferred from the direct attributes of the object to its universal nature. Since the essential character of crime lies in its infinitude, i.e., in the breach of its own right, mere external details vanish. Equality becomes only a general rule for determining the essential, namely, a man's real desert, not for deciding the special external penalty. Only when we limit ourselves to equality in the external details are theft and robbery unequal to fine and imprisonment. But from the standpoint of their value and their general capacity to be injuries, they can be equated. To approach as nearly as possible to this equality in value is, as has been remarked, the task of the understanding. If we ignore the relation of crime to its cancellation, and neglect the idea of value, and the possibility of comparing

these two in terms of their value, we can see in punishment nothing more than the arbitrary attachment of an evil to an act not permitted (Klein, “Grunds, des peinlichen Rechts,” §9).Addition. Retribution is the inner connection and identity of two things which in outward appearance and in external reality are different. Requital seems to be something foreign, and not of right to belong to the criminal. But punishment is only the manifestation of crime, the other half which is necessarily presupposed in the first. Retribution looks like something immoral, like revenge, and may therefore seem to be something personal. But it is the conception, not the personal element, which carries out retribution. Revenge is mine, says God in the Bible, and, when some find in the word retribution the idea of a special pleasure for the subjective will, it must be replied that it signifies only the turning back of crime against itself. The Eumenides sleep, but crime wakes them. So it is the criminal’s own deed which judges itself. Although in requital we cannot venture upon equality of details, the case is different with murder, to which death is necessarily due. Life is the total context of one’s existence, and cannot be measured by value. Its punishment, therefore, cannot be measured by value, but must consist in the taking of another life.

102. In the sphere of direct right the suppression of crime takes, in the first instance, the form of revenge. This in its content is just, so far as it is retribution; but in its form it is the act of a subjective will, which may put into any injury an infinite or unpardonable wrong. Hence its justice is a matter of accident, and for others means only private satisfaction. As revenge is only the positive act of a particular will, it is a new injury. Through this contradiction it becomes an infinite process, the insult being inherited without end from generation to generation. Note. Wherever crime is punished not as crimina pub-lica but as privata, it still has attached to it a remnant of revenge. This is the state of affairs with the Jews, with the

Romans in theft and robbery, and with the English in some special instances. Differing from private revenge is the exercise of revenge by heroes, adventurous knights, and others, all of whom appear when the state is in its infancy. Addition. In that condition of society where there are no judges and no laws, punishment always takes the form of revenge. This is defective, as it is the act of a subjective will, and has an inadequate content. Judges are persons, it is true, but they will the universal meaning of the law, and insert into punishment nothing which is not found in the nature of the act. But the injured person, on the other hand, may view the wrong act not in its necessary limits of quality and quantity, but simply as a wrong, and may in requital do what would lead to a new wrong. Amongst uncivilized peoples revenge is undying, as with the Arabs, amongst whom it can be suppressed only by a superior force or by impossibility. In several of our present regulations a trace of revenge survives, as when it is at the option of individuals to bring an injury to trial at court.

103. That the contradiction involved in this way of abolishing crime, and the contradictions found in other cases of wrong (§§86, 89), should be solved, is a demand made by a justice which is freed at once from all subjective interests and limits and from the arbitrariness of power. Justice, therefore, does not revenge but punishes. Here we have in the first instance the demand of a will, which, while particular and subjective, wills the universal as such. But the conception of morality is not simply demanded, but is in the process created.



Transition from Right to Morality.

104. Crime and revenging justice represent the visible outer form of the development of the will as occurring, first of all, in the distinction between the universal will and the individual will, which exists independently in opposition to the universal. Next, by rising above the opposition, the

universal will is turned back into itself and has become an independent reality. Thus right, when maintained against the independent private will, has validity, being realized through its own necessity. This result is also arrived at by the development of the conception of will on the side of its inner character. The actualization of the will according to its conception proceeds in this way. Its first form is the abstract and simple phase it assumes in abstract right. This first form must be in the next place set aside and passed beyond (§21) in order that the will may become involved in the opposition of the abstract universal will and the independent particular will. Then by the removal of this opposition, i.e., by the negation of a negation, it becomes an actualized will, free not only abstractly and potentially, but actually, as is necessary in a negativity which is able to refer itself to itself. Whereas in abstract right the will was itself mere personality, it now has its personality as its object. The subjectivity which is its own object is infinite, and freedom in its infinite subjectivity constitutes the principle of morality. Note. Let us for the sake of a closer inspection turn back to the elements, through which the conception of freedom progresses from the first abstract phase of the will to that phase, in which it refers itself to itself, the phase of the self-determining subject. Thus property being an external object, we have in it the phase of the abstract "mine;" in exchange we have the common "mine," the "mine" brought into existence by two wills; in wrong the will which belongs to the province of right, the will in its abstract, direct, and intrinsic existence, is made contingent by means of the particular will which is itself contingent. In morality this whole phase of will is so far transcended that its contingency is turned back into itself and made one with itself, and thus becomes a self-referring, infinite contingency of the will, or in a word subjectivity. Addition. To truth it belongs that the conception should exist, and that its reality should correspond to the conception. In right the will exists in an external object. But as it must have

its existence in itself, in an internal thing, it must become its own object; it must pass into subjectivity and have itself over against itself. This relation to itself is affirmative, a relation brought about by the will only through the transcendence of its direct existence. When its first- hand existence is transcended in crime, the way is open, through punishment, the negation of a negation, to affirmation, that is, to morality.

Second Part: Morality.

105. THE MORAL standpoint is the standpoint of the will, not in its abstract or implicit existence, but in its existence for itself, an existence which is infinite (§104). This turning back of the will upon itself, or its actual self-identity, with its associated phases stands in contrast to its abstract implicit existence, and converts person into subject.

106. Subjectivity is the conception made definite, differing therefore from the abstract, general will. Further, the will of the subject, though it still retains traces of self-involved simplicity, is the will of an individual, who is an object for himself. Hence subjectivity is the realization of the conception. This gives freedom a higher ground. Now at last there appears in the idea the side of its real existence, the subjectivity of the will. It is only in the will as subjective that freedom, or the potentially existing will, can be actualized. Note. Morality, the second sphere, gives an outline of the real side of the conception of freedom. Observe the process through which morality passes. As the will has now withdrawn into itself, it appears at the outset as existing independently, having merely a potential identity with the intrinsic or universal will. Then this abstract self-dependence is superseded; and, finally, the will is made really and consciously identical with the intrinsic or universal will. Now in this movement, as I have said, is illustrated the conception of freedom. Freedom or subjectivity is at first abstract and distinct from the conception of it. Then by means of this movement the soil of freedom is so worked up, that for the conception, and necessarily also for the idea, it receives its true realization. The process ends, therefore, when the subjective will has become an objective and truly concrete will. Addition. In right, taken strictly, nothing depends upon my

purpose or intention. The question of the self-determination, impulse, or purpose of the will arises for the first time in morality. Since a man is to be judged according to the direction he has given himself, he is in this act free, let the external features of the act be what they may. As no one can successfully assail a man's inner conviction, and no force can reach it, the moral will is inaccessible. A man's worth is estimated by his inner act. Hence the moral standpoint implies the realization of freedom.

107. As self-determination of will is at the same time a factor of the will's conception, subjectivity is not merely the outward reality of will, but its inner being (§104). This free and independent will, having now become the will of a subject, and assuming in the first instance the form of the conception, has itself a visible realization; otherwise it could not attain to the idea. The moral standpoint is in its realized form the right of the subjective will. In accordance with this right the will recognizes and is a thing, only in so far as the thing is the will's own, and the will in it is itself and subjective. Note. The process of the moral standpoint (Note to preceding paragraph) also appears as the development of the right of the subjective will, or of the way in which the subjective will is realized. Thus the will accounts what in its object it recognizes to be its own as its true conception, its objective or universal reality. Addition. Subjectivity of will, as a complete phase, is in its turn a whole which, by its very nature, must also have objectivity. Freedom can at first realize itself only in the subject, as it is the true material for this realization. But this concrete manifestation of will, which we have called subjectivity, is different from absolute will. From this new onesidedness of subjectivity must the will free itself, in order that it may become absolute will. In morality the interest peculiar to man is in question, and the high value of this interest consists in man's knowing himself to be absolute, and determining himself. Uncivilized man is controlled by the forces and occurrences of nature. Children have no moral

will, but are guided by their parents. Civilized man is determined from within, and wills that he shall be in all he does.

108. The subjective will, in so far as it is directly its own object and distinct from the general will (§106, note), is abstract, limited, and formal. Subjectivity, however, is not formal merely, but, since it is the infinite self-direction of the will, is the will itself taken formally. Since this formal character, as it appears first of all in the particular will, is not as yet identical with the conception of will, the moral standpoint is the standpoint of relation, of obligation or requirement. Since, too, subjectivity involves difference, that is to say, opposition to objectivity as to a mere external existence, there arises here also the standpoint of consciousness (§8), the standpoint of difference in general, of the finite and phenomenal phase of the will. Note. The moral is not at once opposed to the immoral, just as right is not directly opposed to wrong. The general standpoint of both the moral and the immoral depends upon the subjectivity of the will. Addition. In morality self-determination is to be construed as a restless activity, which cannot be satisfied with anything that is. Only in the region of established ethical principles is the will identical with the conception of it, and has only this conception for its content. In morality the will is as yet related to what is potential. This is the standpoint of difference, and the process of this standpoint is the identification of the subjective will with the conception of will. The imperative or ought, which, therefore, still is in morality, is fulfilled only in the ethical sphere. This sphere, to which the subjective will is related, has a twofold nature. It is the substance of the conception, and also external reality. If the good were established in the subjective will, it would not yet be realized.

109. The formal will, by its own determining character, contains at the outset the opposition of subjectivity and objectivity, and the appropriate activity (§8). Of this will we have these further phases. Concrete realization

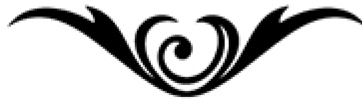
and determinate character are in the conception identical. The conception of the subjective will is first to make these two phases separate and independent, and then to establish them as identical. Determinate character in the self-determined will (a) is brought about in itself by itself, the opposition which it creates within itself being a self- bestowed content. This is the first negation, whose formal limit consists in its being fixed as merely subjective. (b) Since the will returns into itself and is infinite, this limit exists for it, and it wills to transcend the limitation. Hence it strives to convert its content out of subjectivity into objectivity, i.e., some kind of directly given reality, (g) The simple identity of the will with itself in this opposition is the content, which maintains itself amid these oppositions, and is indifferent to formal distinctions. This content is the purpose or end.

110. As at the moral standpoint, freedom or self-identity of will is for the will (§105), the simple identity of the content or end receives a further characteristic peculiar to itself. (a) This content becomes mine in such a way that it in its identity is not only my inner end, but also, so far as it is externally realized, contains for me my subjectivity. Addition. The content of the subjective or moral will has a special character. Although it has attained the form of objectivity, it is yet always to contain my subjectivity. An act shall be counted mine only so far as it is on its inner side issued by me, and was my own proposition and intention. I do not recognize as mine anything in the outward act except what lay in my subjective will, and in the outer act I desire to see my subjective consciousness repeated.

111. (b) The content, though it contains something particular, from whatever source it comes, is yet the content of a self-referring will, which is also self-identical and universal. Thus it has these two features (a) It aims to be in itself adequate to the universal will, or to have the objectivity of the conception; (b) yet, since the subjective will exists for itself, and is

therefore independent and formal (§108), its aim is only an ought and is possibly not adequate to the conception.

112. (c) Though I preserve my subjectivity in accomplishing my ends (§110), yet in the objectification of these ends I pass beyond the simple and elementary subjectivity which is merely my own. This new external subjectivity, which is identical with me, is the will of others (§73). The sphere for the existence of the will is subjectivity (§106), and the will of others is the existence, which, though other than I, I yet give to my purpose. Hence the accomplishment of my purpose contains the identity of my will and that of others, and has to the will of others a relation which is positive. Note. The objectivity of the realized end has three senses, or rather contains in union the three following phases, (a) It is external direct reality (§109). (b) It is adequate to the conception (§112). (g) It is universal subjectivity. The subjectivity which preserves itself in this objectivity implies (a) that the objective end shall be my own, so that in it I preserve myself as a particular individual (§110). The two phases (b)and (g) of subjectivity concur with the phases (b) and (g) of objectivity. At the moral standpoint these various phases are distinguished or joined merely in a contradiction. This is the superficial and finite nature of the moral sphere (§108). The development of the standpoint consists in the development of these contradictions and their solution, an achievement which at the present point of view is incomplete or merely relative. Addition. It was said that formal right contained only prohibitions, and that from the strict standpoint of legal right an act had only a negative reference to the will of others. In morals, on the contrary, the relation of my will to that of others is positive; that, which the subjective will realizes, contains the universal will. In this is present the production or alteration of some visible reality, and this has a bearing upon the will of others. The conception of morality is the internal relation of the will to itself. But there is here more than one will, since the objectification



of the will implies the transcendence of the onesidedness of the separate will, and the substitution of two wills having a positive relation one to the other. In right my will is realized in property, and there is no room for any reference of the will of others to my will. But morality treats of the well-being of others also. At this point this positive relation to others first makes its appearance.

113. The expression of the subjective or moral will is action. Of action it may be said that (a) I know its external fulfilment to be mine, (b) it is essentially related to the conception in its phase as the ought or imperative, and (g) it is essentially connected with the will of others. Note. Firstly, the expression of the moral will is action. The embodiment achieved by the will in formal right is a mere object. This realization is direct, and has in the first instance no actual express reference to the conception. Not having as yet come into conflict with the subjective will, the conception is not yet distinguished from it, and has no positive relation to the will of others. The commands of right are, hence, fundamentally prohibitions (§38). In contract and wrong, indeed, there begins to be seen a relation to the will of others, but the agreement, found at this point, is based upon arbitrary choice, while the essential reference to the will of others is in right merely the negative proposal to keep my property or the worth of it, and to let others keep theirs. Crime does in a way issue from the subjective will. But the content of a crime is fixed by written instructions and is not directly imputable to me. Hence as the legal act contains only some elements of a distinctively moral act, the two kinds of action are different.

114. The right of the moral will has three factors: (a) The abstract or formal right. The act, as directly realized, is to be in its essential content mine, and embody the purpose of the subjective will. (b) The specific side of an act or its inner content, (a) This is intention, which is for me, whose general character is fixed, the value and inner substance of the act, (b) and

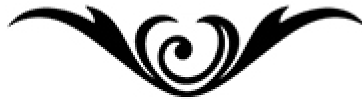
well-being, or the content taken as the particular end of my particular, subjective reality. (c) The good, or the content taken as universal and exalted to universality and absolute objectivity. This is the absolute end of the will. As this is the sphere of reflection, we have the opposition of the universality, which is subjective, and hence involves in one aspect evil, and in another conscience. Addition. An act, to be moral, must in the first instance accord with my purpose, since the right of the moral will is to recognize as its realization nothing which is not found internally in the purpose. Purpose concerns the formal principle that the externalized will must also be internal to me. In the next place we ask after the intention, that is, the value of the act relatively to me. The third factor is not merely the relative, but the universal value of the act, the good. In the first phase of an act there is a breach between purpose and realization; in the second between what is given externally as universal will, and the particular internal character, which I give it; the third and last phase is the claim of my intention to be the universal content. The good is the intention exalted to the conception of the will.

First Section: Purpose and Responsibility.

115. In the direct or immediate act the subjective will is finite, since it has to do with both an external object and its varied surroundings, all presupposed. An accomplished act makes a change in this ready-to-hand material, and the will is responsible, in so far as the changed material can be said to be mine. Note. An event or resultant condition is a concrete external reality, having an indefinite number of circumstances associated with it. Every particular element, shown to be in any sense a condition, ground or cause of such an event, and, therefore, to have contributed its portion, may be regarded as responsible for it, or at least as sharing in the responsibility. Hence in the case of such a richly varied event as the French Revolution, the formal understanding has to select from an untold multitude of circumstances that one to which it will attribute responsibility. Addition. What is contained in my purpose can be laid at my door, and this is one of the main considerations in the case of crime. But in simple responsibility there is round only the quite external judgment as to whether I nave or have not done this thing. Thus merely to be responsible does not mean that the whole thing is to be imputed to me.

116. It is not my deed, if things, which I own, cause injury to others through some of their many external connections; this may happen even with my body as a mechanical or living object. Yet I am not wholly free from responsibility in such a case, since these things are still mine, although by their very nature they are often only imperfectly subject to my attention and control.

117. When the self-directing will proposes to act upon a given material, it has a representation of the circumstances. Since the material is supplied,



the will is finite, and the results of the act are for it accidental. Hence they may contain something very different from the representation. But the right of the will in acting is to recognize as its own deed only those results which were consciously in its end and were purposed. That responsibility shall extend to the will only so far as the results were known, is the right of knowledge. Addition. The will has before it an outer reality, upon which it operates. But to be able to do this, it must have a representation of this reality. True responsibility is mine only in so far as the outer reality was within my consciousness. The will, because this external matter is supplied to it, is finite; or rather because it is finite, the matter is supplied. When I think and will rationally, I am not at this standpoint of finitude, nor is the object I act upon something opposed to me. The finite always has limit and boundary. There stands opposed to me that which is other than I, something accidental and externally necessary; it may or may not fall into agreement with me. But I am only what relates to my freedom; and the act is the purport of my will only in so far as I am aware of it. Œdipus, who unwittingly slew his father, is not to be arraigned as a patricide. In the ancient laws, however, less value was attached to the subjective side of the act than is done to-day. Hence arose amongst the ancients asylums, where the fugitive from revenge might be received and protected.

118. An act, when it has become an external reality, and is connected with a varied outer necessity, has manifold consequences. These consequences, being the visible shape, whose soul is the end of action, belong to the act. But at the same time the inner act, when realized as an end in the external world, is handed over to external forces, which attach to it something quite different from what it is in itself, and thus carry it away into strange and distant consequences. It is the right of the will to adopt only the first consequences, since they alone lie in the purpose. Note. The division of consequences into necessary and accidental is not accurate,

because the inner necessity, involved in the finite, is realized as a necessity which is external, a necessity, that is to say, implying a relation of separate things, which are independent, indifferent to one another, and only externally connected. The principle "In acting neglect the consequences," and the principle "Judge an act by its consequences, and make them the standard of what is right and good," belong both alike to the abstract understanding. The consequences are the native form of the act, simply manifest its nature, and are nothing but the act itself. The act cannot scorn and disown them. Yet amongst the consequences is included that which is only externally attached to them and has no fellowship with the act itself. The development of the contradiction involved in the necessary nature of the finite is in external reality the conversion of necessity into contingency and vice versa. An overt act must therefore conform to this law. This law it is which stands the criminal in such good stead, if his act has had but few consequences; so also must the good act be contented to have few or no consequences. But when the consequences of crime have fully developed themselves, they add to the severity of the punishment. The self-consciousness of the heroic age, painted in the tragedy of "Œdipus," for instance, had not risen out of its simplicity, or reflectively appreciated the difference between realized deed and inner act, between the outer occurrence and the purpose and knowledge of surroundings. Nor did it distinguish between one consequence and another, but spread responsibility over the whole area of the deed. Addition. In the fact that I recognize as mine only what was in my representation is to be found the transition from purpose to intention. Only what I knew of the surroundings can be imputed to me. But there are necessary results attached to even the simplest act, and they are its universal element. The consequences, which may be prevented from taking effect, I cannot indeed foresee, but I ought to know the universal nature of each separate concrete deed. The thing which I ought to

know is the essential whole, which refers not to special details of an act, but to its real nature. The transition from purpose to intention consists in my being aware not merely of my separate act, but of the universal bound up with it. This universal, when willed by me, is my intention.

Second Section: Intention and Well-being.

119. THE EXTERNAL embodiment of an act is composed of many parts, and may be regarded as capable of being divided into an infinite number of particulars. An act may be looked on as in the first instance coming into contact with only one of these particulars. But the truth of the particular is the universal. A definite act is not confined in its content to one isolated point of the varied external world, but is universal, including these varied relations within itself. The purpose, which is the product of thought and embraces not the particular only but also the universal side, is intention. Note. Intention (in German, "a looking away from") implies, according to its etymology, an abstraction, which has in part the form of universality, and partly is the extraction of a particular side of the concrete thing. The attempt to justify oneself by the intention consists, in general, in asserting that one special isolated phase is the subjective essence of the act. To pass judgment upon an act simply as an external deed, without qualifying it as right or wrong, imparts to it a universal predicate; it is killing, arson, etc. When the parts of external reality are taken one by one, their connection must naturally be external. Reality may be, in the first instance, touched at only a single point. Arson, e.g., may be directly concerned with only a small piece of wood, a statement which is merely a proposition, but not a judgment. But this single point has a universal nature, which involves the extension of it. In life the separate part is not a mere part, but directly an organ, in which the universal is really present. Hence in murder it is not a separate piece of flesh, but the life itself which is destroyed. On one side subjective reflection, in its ignorance of the logical nature of the particular and the universal, permits of a dissection into mere particulars and their

consequences. On the other side, the act in its finite and casual character naturally breaks up into separate parts. The invention of the dolus indirectus is due to this way of thinking. Addition. Manifestly more or fewer circumstances may be included in an act. In the case of arson, e.g., the fire may not take effect, or it may spread farther than the agent intended. Yet in neither case is the result due to good or bad fortune, since man in acting must deal with externality. An old proverb rightly enough says, "A stone flung from the hand is the devil's." In acting I must expose myself to misfortune; that also has a right to me, and is the manifestation of my own will.

120. The right of intention is that the universal quality of the act should not only be implicitly present, but should be known by the agent, and be part and parcel of his subjective will. Conversely the right of objectivity of action, as it may be called, is to maintain that it be known and willed by a subject in his character as thinking. Note. This right to this insight involves that children, imbeciles, and lunatics are completely, or almost completely, irresponsible for their actions. Just as actions on the side of their external reality include accidental results, so also the subjective reality contains an indeterminate element, which depends upon the strength of self-consciousness and prudence. But this uncertain element needs to be reckoned with only in the case of imbecility, lunacy, or childhood. These are the only conditions of mind which supersede thought and free will, and permit us to take an agent otherwise than in accordance with his dignity as free and rational.

121. The universal quality of action is in general the manifold content reduced to the simple form of universality. But the subject turned back into himself is particular, in opposition to the particulars of the objective world. He has in his end his own particular content, which constitutes the essential soul of his act. In the execution of this particular content of the act consists

his subjective freedom in its concrete character. This is the subject's right to find in the act his satisfaction. Addition. I, as independent and self-referred, am particular, and opposed to the external side of the act. Its content is decided by my end. Murder and arson, e.g., are quite general and not the positive content of me, a subject. When anyone has committed a crime, we ask why he has done it. Murder is not done for the sake of murder. There must be besides a particular positive end. If delight in murder were the motive of the crime, it would be the positive content of the subject as such, and the deed would be the satisfaction of his desire. The motive of a deed contains the moral element, which has the twofold signification of the universal in purpose and of the particular in intention. In modern times we are at pains to ask after the motive. Formerly the question was merely, Is this man just? Does he do his duty? Now we scrutinize the heart, and fix a gulf between the objective side of conduct and the internal subjective side, or motive. No doubt the subject's own determination must be considered. What he wills has its ground within him; he wills to satisfy a pleasure or gratify a passion. But right and good are also precisely such a content, due, however, not to nature but to my reason. To make my own freedom the content of my will is a pure characteristic of my freedom itself. Hence the higher moral phase is to find satisfaction in the act, not to harp upon a breech between the objectivity of the deed, and the self- consciousness of man. This defective mode of interpretation has its epochs as well in world-history as in the history of individuals.

122. By virtue of the particular element the act has for me subjective value or interest. In contrast with this end, whose content is the intention, the direct act in its wider content is reduced to a means. This end, as far as it is finite, can again be reduced to a means for a wider intention, and so on indefinitely.

123. The content of these ends is only (a) formal activity, that is, the subject's interest or aim is to be effected by his agency. Men desire to be themselves actively interested in whatever is or ought to be their own. (b) Further definite content is found for the still abstract and formal freedom of subjectivity only in its natural subjective embodiment, as inclinations, passions, opinions, whims, etc. The satisfaction of this content is well-being or happiness in its particular as also in its universal features. In this satisfaction consist the ends of finitude generally. Note. This is the standpoint of relation (§108). The subject at this stage emphasizes his distinctive and particular nature. Here enters the content of the natural will (§11). But the will is not in its simple and direct form, since the content belongs to a will which is turned back into itself, and raised to the level of a universal end, namely, well-being or happiness. Addition. In so far as the elements of happiness are externally provided, they are not the true elements of freedom. Freedom truly is itself only in an end constituted by itself, i.e., the good. Here the question may be raised, Has man a right to set up for himself ends which are not free, and depend simply on his being a living thing? But life in man is not a mere accident, since it accords with reason. Man has. so far a right to make his wants an end. There is nothing degrading in one's being alive. There is open to us no more spiritual region, in which we can exist, than that of life. Only through the exaltation of what is externally provided to the level of something self-created do we enter the higher altitude of the good. But this distinction implies no intolerance of either side of man's nature.

124. Since the subjective satisfaction of the individual, the recognition for example of oneself as honoured or famous, is involved in the realization of absolutely valid ends, the demand that only subjective satisfaction should appear as willed and attained, and also the view that in action subjective and objective ends exclude each other, are empty assertions of the abstract

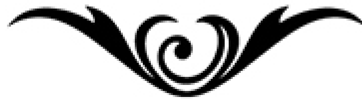
understanding. Nay, more, the argument becomes a positive evil when it is held that, because subjective satisfaction is always found in every finished work, it must be the essential intention of the agent, the objective end being only a means to the attainment of this satisfaction. The subject is the series of his acts. If these are a series of worthless productions, the subjectivity of the will is also worthless; if the acts are substantial and sound, so likewise is the inner will of the individual. Note. The right of the subject's particular being to find himself satisfied, the right, in other words, of subjective freedom, constitutes the middle or turning-point between the ancient and the modern world. This right in its infinite nature is expressed in Christianity, and has been made the universal active principle of a new form of the world. The more definite manifestations of this principle are love, romance, the hope of the eternal salvation of the individual, morality also, and conscience. It includes, moreover, various other forms, which will be, in a measure, introduced in the sequel as the principle of the civic society, and as elements of the political constitution, but partly, however, appear in history generally, especially in the history of art, the sciences, and philosophy. This principle of particularity is now, indeed, one side of the contradiction, and, in the first resort, is at least quite as much identical with the universal as distinct from it. But abstract reflection fastens upon this element in its difference from and opposition to the universal, and propounds the view that morality must carry on a continued warfare against the satisfaction of oneself, demanding of us —

"Mit Abscheu zu thun was die Pflicht gebeut."

The same abstract standpoint lies at the root of that psychological view of history, which seeks to disparage all great deeds and persons. It emphasizes the particular side, which it has already decreed to be evil,

considers as the chief factor in the act the honour and glory, which may accrue to the agent, and transforms and converts the inclinations and passions, whose satisfaction was only one element of the total result, into the agent's main intention and active principle. This same abstract point of view asserts that because great acts, and the real result brought to pass by a series of them, have produced a great effect upon the world, and have naturally resulted to the agent in power, honour, and renown, therefore there belongs to the individual not the greatness, but merely these particular and external results. The reason assigned is that the particular consequence, since it was admittedly an end, must be the sole end. Such abstract thinking sees only the subjective side of great men, the side which constitutes its own essence. In its self- constituted vanity it overlooks their real nature. It takes the view of the "psychological valet for whom there are no heroes, not because there are no heroes, but because he is only a valet." Addition. The sentence, In magnis voluisse sat est, is right, if it means that one should will something great. But he should also carry it put, otherwise his volition is vain. The laurels of mere willing are dry leaves, which have never been green.

125. The subjective, whose concern is with the particular content of well-being, is, when it becomes infinite by being turned back into itself, at the same time brought into relation with implicit or general will. This new element, established, in the first instance, in particularity itself, is the well-being of others; in its complete but quite empty character it is the well-being of all. The well-being of many other particular persons is therefore an essential end or right of subjectivity. But since the absolute universal, which is distinguished from this particular content, is here defined simply as right, the ends of the particular will may or may not be in real accordance with the universal.



126. My own particularity, and likewise the particularity of others are, however, a right, only in so far as I am free. They cannot maintain themselves in opposition to their real basis. An intention to further my well-being or that of others, rightly called a moral intention, cannot justify a wrong act. Note. It is one of the most corrupt maxims of our day which, originating in the pre-Kantian period of the good heart, and furnishing the quintessence of some well-known touching dramas, undertakes in the case of wrong acts to excite interest in the so-called moral intention. It pictures bad persons as having hearts filled with good intentions and desires for their own well-being, and perhaps for that of others as well. A heightened form of this theory has been vamped up in our own time. Inner inspiration and feeling, the very soul of particularity, have been made the criterion of what is right, reasonable, and excellent. Crime has been pronounced right, reasonable, and excellent, as also have the thoughts which led to it, merely on the ground that they proceeded from inspiration and feeling, though they may have been in fact the most hollow and commonplace whims and most foolish opinions (§140, note). Observe further that here under right and well-being we are considering the formal right and particular well-being of the individual. The so-called general welfare, the well-being of the state, the right of the real, concrete spirit is quite another region, in which formal right and the particular well-being or happiness of the individual are subordinate elements. It has already been remarked that it is one of the most frequent misconceptions of the abstract intellect to set up private right and private well-being as absolutely valid in opposition to the universal principle of the state. Addition. We may quote here the celebrated retort given to the libeller, who excused himself with the remark, “Il faut donc que je vive.” “Je n’en vois pas la necessité,” was the reply. Life is not necessary against the higher fact of freedom. When the holy Crispinus steals leather to

make boots for the poor, his act, though moral, is not right, and cannot be justified.

127. The particular interests of the natural will, viewed as a simple whole, constitute personal reality or the life. In the final resort, life, when in collision with another's rightful ownership, can claim the right of necessity, not on the ground of equity but of right. Observe that on the one side is placed the infinite destruction of our outer existence, and therefore the complete loss of rights; on the other side an injury to only a particular and limited embodiment of one's freedom. A slight injury to a particular possession does not violate the injured man's right, as such, or his capacity for right. Note. Prom this right of need flows the benefit of competence (beneficium competentice), by virtue of which there is allowed to the debtor some of his tools, implements, clothes, and means generally, all of which are of course the property of the creditor. The allowance covers so much as is deemed sufficient for the possible maintenance of one in the debtor's class. Addition. Life, or the totality of ends, has a right against abstract right. For instance, by the theft of a loaf of bread a property is doubtless injured. Still, if the act was the means of prolonging life, it would be wrong to consider it as ordinary theft. If the man whose life is in danger were not allowed to preserve himself, he would be without rights; and, since his life is refused him, his whole freedom is denied to him also. Many things, it is true, must go to secure life, especially if we regard the future. But to live now is all that is necessary; the future is not absolute, and remains exposed to accidents. Hence only the need of the immediate present can justify a wrong act. Yet the act is justified, because the agent, abstaining from it, would commit the highest wrong, namely, the total negation of his realized freedom. The beneficium competentice implies the right to ask that no man shall be wholly sacrificed to mere right.

128. Need reveals the finite and contingent character of both right and well-being, that is to say, of that abstract embodiment of freedom, which is not the existence of any particular person, and also of the sphere of the particular will, which excluded the universality of right. The onesidedness or ideality of these phases is found in the conception itself. Right has already been embodied as the particular will (§106); and subjectivity, in the whole range of its particularity, is itself the embodiment of freedom (§127), and also, in its character as the infinite reference of the will to itself, is it implicitly the universal side of freedom. These two elements in their truth and identity, although, in the first instance, only in relative reference to each other, are on the one hand the good, as the fulfilled and absolutely definite universal, and, on the other hand, conscience, or an infinite subjectivity, which is aware of itself, and determines in itself its content.

Third Section: The Good and Conscience.

129. THE GOOD is the idea, or unity of the conception of the will with the particular will. Abstract right, well-being, the subjectivity of consciousness, and the contingency of external reality, are in their independent and separate existences superseded in this unity, although in their real essence they are contained in it and preserved. This unity is realized freedom, the absolute final cause of the world. Addition. Every stage is properly the idea, but the earlier steps contain the idea only in more abstract form. The I, as person, is already the idea, although in its most abstract guise. The good is the idea more completely determined; it is the unity of the conception of will with the particular will. It is not something abstractly right, but has a real content, whose substance constitutes both right and well-being.

130. In this idea well-being has value, not independently as the realization of the separate particular will, but only as universal well-being, as universal, that is, in its essence, intrinsically or in accordance with freedom. Hence, well-being is not a good, if separated from right; nor is right a good, if separated from well-being. Fiat justitia ought not to have pereat mundus as a consequence. The good, carrying a necessity to be actualized by the particular will, and comprising the vital essence of such a will, has absolute right over the mere abstract right of property and the particular ends of well-being. If either of these elements is distinguished from the good, it has validity only in so far as it accords with the good and subordinates itself to it.

131. The subjective will finds in the good the supremely essential, and has worth and merit only as its insight and intention accord with the good. In so far as the good in this place is still the abstract idea of the good, the

subjective will is not yet carried up into it, and made one with it. It stands to the good in a relation of the following kind. As the good is for it what is real and substantial, it ought to make the good its end and realize it; and on the other hand it is only through the medium of the subjective will that the good can be realized. Addition. The good is the truth of the particular will. But the will is only that to which it sets itself. It is not inherently good, but becomes what it is only by its work. On the other side the good apart from the subjective will is only an abstraction having no reality. Reality first comes to the good through the private will. Thus the development of the good contains these three stages. (1) For me, as willing, the good should be particular will, and I should know it. (2) We should say what thing is good, and develop the particular phases of the good. (3) We determine the independent good, particularizing it as infinite and independent subjectivity. This inner determination is conscience.

132. It is the right of the subjective will that it should regard as good what it recognizes as authoritative. It is the individual's right, too, that an act, as the outer realization of an end, should be counted right or wrong, good or evil, lawful or unlawful, according to his knowledge of the worth it has when objectively realized. Note. The good is in general the essence of the will in its substantive and universal character, the will in its truth. It exists solely in and by means of thought. The doctrines that man cannot understand the truth but must deal with appearances only, and that thinking does harm to the good will, take away from spirit all its intellectual and ethical merit and value. The right to admit nothing, which I do not regard as reasonable, is the highest right of the subject. But because of its subjective character it is a formal right. So that on the opposite hand the right to the subject of the reasonable or objective remains. Because of its formal nature insight may be either truth or mere opinion and error. Whether or not the individual attains to the right of his insight belongs, at least from the moral

standpoint, to his particular subjective character. I can make it a claim upon myself, and regard it as a subjective right, that I should be convinced that the grounds of an obligation are good. I may even claim that I should know them in their conception and nature. But my demand for the satisfaction of my conviction as to what is good, what allowed and what not allowed, and also as to my responsibility, does not infringe upon the right of objectivity. Right of insight into the good is different from right of insight (§117) with regard to action as such. The right of objectivity means that the act must be a change in the actual world, be recognized there, and in general be adequate to what has validity there. Whoso will act in this actual world has thereby submitted to its laws, and recognized the right of objectivity. Similarly in the state which is the objectivity of the conception of reason, legal responsibility does not adapt itself to what any one person holds to be reasonable or unreasonable. It does not adhere to subjective insight into right or wrong, good or evil, or to the claims which an individual makes for the satisfaction of his conviction. In this objective field the right of insight is reckoned as insight into what is legal or illegal, or the actual law. It limits itself to its simplest meaning, namely, knowledge of or acquaintance with what is lawful and binding. Through the publicity of the laws and through general customs the state removes from the right of insight that which is for the subject its formal side. It removes also the element of chance, which at our present standpoint still clings to it. The right of the subject to know the act as good or evil, legal or illegal, has the result of lessening or abolishing responsibility in the case of children, imbeciles, and lunatics, although the conditions of this responsibility cannot be definitely stated. But to take into consideration momentary fascination, the allurement of passion, drunkenness, or the strength of what are called sensual impulses generally, that impulse alone being excepted which forms the basis of the right of need (§120), to consider these things in estimating the character of a crime and

its liability to punishment, or to suppose that these circum-stances will remove the guilt of a criminal act, is to neglect right and the true dignity of manhood (§100, and §119, note). The nature of man is essentially universal. His consciousness does not exist as a mere abstract moment of time or in isolated parts. Just as the incendiary sets on fire not a separate piece of wood an inch long, which he touches with his match, but the universal involved in it, namely the house, so he does not exist merely in one single moment, or in one isolated passion for revenge. If so, he would be an animal, which, because of its dangerous and passionate nature would have to be killed. It is claimed that the criminal in the moment of his act must have presented clearly to himself the nature of the wrong he is doing and of his liability to punishment, if the act is to be counted to him for a crime. This claim seems to preserve to him the right of his moral subjectivity, but it really denies to him that indwelling intelligent nature, which in its active presence has no affinity with the clear images of purely animal psychology. Only in the case of lunacy is intelligence so distorted as to be separated from the consciousness of particular things and the doing of them. The sphere, in which circumstances are adduced as grounds for leniency, is not that of right but of mercy.

133. Since the good is the essence of the will of the particular subject, it is his obligation. As the good is distinct from particularity, and particularity occurs in the subjective will, the good has at the outset only the character of universal abstract essence. This abstract universal is duty. Hence duty, as is required by its character, must be done for duty's sake. Addition. The essence of the will is for me duty. Yet if I know no more than that the good is my duty, it is for me still abstract. Duty should be done for duty's sake, and it is my objective nature in the truest sense which I realize in duty; in doing it I am self-centred and free. It is the signal merit of the standpoint of

the Kantian philosophy of action that it has made prominent this signification of duty.

134. Since an act requires its own special content and definite end, and duty in the abstract contains no such end, there arises the question, What is duty? No answer is at once forthcoming, except “To do right, and to consider one’s own well-being, and the general well-being, the well- being of others “ (§119). Addition. Precisely the same question was proposed to Jesus, when it was asked of him, “What should be done to obtain eternal life?” The universal good cannot, if abstractly taken, be realized. If it is to be realized, it must be given a particular content.

135. The two points of this answer, being each of them conditioned and limited, are not in fact contained in duty itself, but effect the transition into the higher sphere of the unconditioned, or duty. In so far as duty is the universal or essence of the moral consciousness, and merely refers itself to itself within itself, it is only an abstract universality, and has for its characteristic an identity without content, an abstract positive, an absence of definite character. Note. It is important to be clear that the pure unconditioned self direction of the will is the root of duty. This doctrine of volition attained to a firm basis and starting-point first of all in the Kantian philosophy through the thought of the infinite autonomy of the will (§133). Yet if this merely moral standpoint does not pass into the conception of the ethical system, this philosophical acquisition is reduced to empty formalism, and moral science is converted into mere rhetoric about duty for duty’s sake. From such a position can be derived no inherent doctrine of duties. Materials, it is true, may be introduced from without, and in this way specific duties may be secured; but from duty, whose characteristic is an absence of contradiction or formal concord with itself, a characteristic which is no more than the establishment of abstract indefiniteness, no specific duties can be deduced. Nor, further, if any specific content of action

comes up for consideration, is there in this principle any way of judging whether it is a duty or not. On the contrary, all manner of wrong and immoral acts may be by such a method justified. The more detailed Kantian statement, the suitability of an act to be presented as a universal rule, implies indeed the more concrete notion of a condition, but really contains no other principle than absence of contradiction, or formal identity. The rule that there should be no private property contains of itself no contradiction, nor does the proposition that this or that particular nation or family should not exist, or that no one should live at all. Only if it is really fixed and assumed that private property and human life should exist and be respected, is it a contradiction to commit theft or murder. There can be no contradiction except of something that exists or of a content, which is assumed to be a fixed principle. Only such a content can an act agree with or contradict. But duty which must be willed only as such, and not for the sake of a content, is a formal identity excluding all content and specific character. Other antinomies and developments of the Kantian position, in which is shown how the moral standpoint of relation wanders aimlessly around without being able to find a way of escape from the mere abstract imperative, I have given in the "Phänomenologie des Geistes." Addition. Although we exalted the standpoint of the Kantian philosophy, in so far as it nobly insists that duty should accord with reason, yet its weakness is that it lacks all organic filling. The proposition, "Consider if thy maxim can be set up as a universal rule" would be all right, if we already had definite rules concerning what should be done. A principle that is suitable for universal legislation already presupposes a content. If the content is present, the application of the law is an easy matter. But in the Kantian theory the rule is not to hand, and the criterion that there should be no contradiction produces nothing. Where there is nothing, there can be no contradiction.

136. Owing to the abstract nature of the good, the other side of the idea, i.e., particularity in general, falls within subjectivity. This subjectivity, universalized by being turned back into itself, is absolute certitude [Gewissheit.] of itself within itself. In this character it establishes particularity, it determines and judges. This is conscience. [Gewissen.] Addition. We may speak in a lofty strain of duty, and this way of speaking elevates mankind, and widens the heart. Yet if nothing definite comes of it, it at last grows tedious. Spirit demands and is entitled to a particular content. But conscience is the deepest internal solitude, from which both limit and the external have wholly disappeared. It is a thorough-going retreat into itself. Man in his conscience is no longer bound by the ends of particularity. This is a higher standpoint, the standpoint of the modern world. We have now arrived at the stage of consciousness, which involves a recoil upon itself. Earlier ages were more sensuous, and had before them something external and given, whether it was religion or law. But conscience is aware of itself as thought, and knows that my thought is for me the only thing that is binding.

137. True conscience is the disposition to desire what is absolutely good. It has therefore fixed rules, which are for it independently objective phases and duties. Distinguished from this, which is its content or truth, conscience is only the formal side of the activity of the will, and the will as particular has no content peculiarly its own. The objective system of rules and duties and the union of them with the subjective consciousness appear first in the sphere of ethical observance. But at the formal standpoint of morality, conscience is devoid of objective content. It is merely an infinite certitude of itself and is formal and abstract. It is the certitude of a particular subject. Note. Conscience expresses the absolute claim of the subjective self-consciousness to know in itself and from itself what right and duty are, and to recognize nothing except what it thus knows to be good. It asserts also

that what it so knows and wills is right and duty in very truth. Conscience, as the unity of the subject's will with the absolute, is a holy place which it would be sacrilege to assault. But whether the conscience of a certain individual is proportionate to this idea of conscience, in other words, whether what the individual conscience holds and gives out to be good is really good, can be ascertained only by an examination of the contents of the intended good. Bight and duty, viewed as absolutely reasonable phases of will, are not in essence the particular property of an individual. Nor do they assume the form of perception or any other phase of mere individual sensuous consciousness. They are the universal products of thought, and exist in the form of laws and principles. Conscience is therefore subject to the judgment whether it is true or not, and its appeal merely to itself is directly opposed to what it wills to be, the rule, that is, of a reasonable absolutely valid way of acting. For this reason the state cannot recognize conscience in its peculiar form as subjective consciousness, just as subjective opinion, or the dogmatic appeal to a subjective opinion, can be of no avail in science. The elements which are united in true conscience can be separated. The determining subjectivity of consciousness and will may separate itself from the true content, proceed to establish itself, and reduce the true content to a form and unreality. Thus the term conscience is ambiguous. On the one hand it is presupposed in the identity of subjective consciousness and will with the true good, and is therefore maintained and recognized to be a holy thing. On the other hand it is the mere subjective return of consciousness into itself, claiming the authority which conscience in its first form possesses solely because of its absolutely valid and rational content. Now, at the moral standpoint, distinguished as it is in this treatise from ethical observance, there occurs only the formal conscience. The true conscience is mentioned here only to emphasize the difference between the two and to remove the possibility of supposing that here, where the formal

conscience alone is considered, the argument is concerned with the true. But to repeat, the true conscience looms up only in the sequel, and has to do with the properly social disposition. The religious conscience, however, does not belong to this sphere at all. Addition. When we speak of conscience, it may easily be supposed that because of its abstract inner form, it is already the absolutely true conscience. But conscience as true wills absolute good and absolute duty. As we must here deal with the abstract good, conscience is so far devoid of this objective content, and is at first only the infinite certitude of itself.

138. Subjectivity, as abstract self-determination and pure certitude only of itself, dissolves within itself all definite realization of right and duty. It passes judgment within itself, determines solely out of itself what is good, and makes this self-produced good its content. It bestows reality upon a good which is at first only presented and intended. Note. The self-consciousness, which has reached absolute return into itself, is conscious of itself as something over which nothing that exists or is given to it can or ought to have any power. This tendency to look within, and know and decide from oneself what is right and good, assumes a more general form in history, appearing at epochs such as that of Socrates, the Stoics, etc., when the accepted ethical principles could not satisfy the better will. When the visible world has become untrue to freedom, the will no longer finds itself in the established morality, and is forced to seek the harmony, which the actual world has lost, in the inner ideal life. Since the right, which self-consciousness acquires in this way, is formal, everything depends upon the nature of the content, which it gives itself. Addition. In the simple conception of conscience all definite phases of will are dissolved, and must proceed out of it again. Everything that is recognized as right or duty can in the first instance be proved by thought to be worthless, limited, and merely relative. But subjectivity, though it dissolves all content, must develop it

again out of itself. Everything which comes to pass in ethical observance, is to be produced by this activity of spirit. But, on the other side, this standpoint is defective, because it is merely abstract. When I am conscious of my freedom as inner substantive reality, I do no act; yet if I do act and seek principles, I must try to obtain definite characters for my act. The demand is then made that this definite context shall be deduced from the conception of the free will. Hence, if it is right to absorb right and duty into subjectivity, it is on the other hand wrong if this abstract basis of action is not again evolved. Only in times when reality is a hollow, unspiritual, and shadowy existence, can a retreat be permitted out of the actual into an inner life. Socrates appeared at the time of the decay of the Athenian democracy. He dissolved what was established, and fled back into himself, to seek there what was right and good. In our own time also it occurs more or less frequently that reverence for the established is wanting, and that man. holds his own will as for himself valid and authoritative.

139. Self-consciousness, affirming to be vanity all otherwise valid marks of action, and itself consisting of pure inwardness of will, may possibly convert the absolute universal into mere caprice. It may make a principle out of what is peculiar to particularity, placing it over the universal and realizing it in action. This is evil. Note. If conscience is taken as formal subjectivity, it is on the verge of being transformed into evil. In a self-certitude, which exists for itself, knows and decides for itself, both morality and evil have their common root. The origin of evil in general lies in the mystery, i.e., the speculative process, of freedom, in the necessity of freedom to rise out of its natural state, and find itself within itself in opposition to the natural. In this opposition the natural will is contradictory of itself and incompatible with itself, and comes in this divided state into existence. Hence the particularity of the will itself receives the further mark of evil. Particularity has a twofold character, exhibited here in the

opposition of the natural to the inner will. Through this opposition the inner phase of will gets only a relative and formal existence, and therefore has to create its content out of the elements of the natural will, such as desire, impulse, and inclination. These desires and impulses may be either good or evil. But again, owing to their mere naturalness, they are contingent, and the will, as at present constituted, takes them in their contingent character as its content and brings them under the form of particularity. It thus becomes opposed to universality, the inner objective reality or the good, which, since it involves the return of the will into itself and a consciousness aware of itself, stands at the other extreme from the direct objectivity of what is merely natural. Thus also is this inner condition of the will evil. Man is consequently evil at once by nature or of himself and through his reflection within himself. Evil is not limited solely either to nature as such, unless it were the natural condition of a will which confines itself to its particular content, or to the reflection which goes into itself and includes cognition, unless it were to adhere to an antagonism to the good. Along with the phase, that evil of necessity is, goes inseparably the phase that evil of necessity shall not be. In other words, evil is that which is to be superseded. Nevertheless, evil from the first standpoint of disruption must make its appearance, since it constitutes the division between the unreasoning beast and man. We must not, however, remain at this standpoint, or cling to the particular as though it in contrast with the universal were essential, but must overcome it, and set it aside as null and void. Further, as to this necessity of evil, it is subjectivity, or the infinity constituted by the reflex action of consciousness, which has this opposition before itself and exists in it. If it remains there, i.e., if it is evil, it exists simply for itself, counts itself as independent, and is mere caprice. Hence the individual subject as such has the guilt of his evil. Addition. Abstract certitude, which is aware of itself as the basis of everything, involves the possibility of willing the universality of

the conception, but also the possibility of making a principle out of a particular content and realizing it. This second possibility is evil. To evil always belongs the abstraction implied in self-certitude, and man alone, just in so far as he can be evil, is good. Good and evil are inseparable, their unity lying in this, that the conception becomes objective to itself and forthwith, as an object, involves distinction. The evil will wills something that is opposed to the universality of will; but the good will is in accordance with its true conception. The difficulty as to how the will can be evil is due usually to our thinking of the will as in only a positive relation to itself, and to our representing it as some definite thing existing for itself, i.e., as the good. The question as to the origin of evil may be put better thus: How does the negative enter into the positive? If God in the creation of the world is supposed to be the absolutely positive, then, let man turn where he will, he cannot in the positive find the negative. The view that God permitted evil to exist, involving a passive relation of God to evil, offers no satisfactory solution of the problem. In the religious myth the origin of evil is not rationally conceived; the negative is not recognized to be in the positive. One is supposed to come after the other or to exist side by side with it, so that the negative comes to the positive from the outside. With this view thought cannot be satisfied. Thought desires a reason and a necessary relation, and insists that the negative and positive spring from the self-same root. The solution of the difficulty from the standing-ground of the conception is already contained in the conception. The conception, or, to speak more concretely, the idea, must in its very essence find distinctions in itself and establish itself as negative. To adhere to the positive merely, that is to say to the pure good, which shall be in its origin nothing but good, is an empty effort of the understanding, which creates difficulty by introducing one-sidedness and abstraction. But from the ground of the conception the positive phase is apprehended as an activity distinguishing

itself from itself. Evil as well as good has its origin in the will, and the will in its conception is both good and evil. The natural will is, as it stands, a contradiction, implying a distinction of itself from itself, in order that it may be consciously for itself, and attain its inward nature. The proposition, that owing to the nature of evil man is evil, in so far as his will is natural, is opposed to a current idea that it is precisely the natural will which is innocent and good. But the natural will is opposed to the content of freedom. The child, or uneducated man, possessing only the natural will, is not fully responsible. When we speak of man, we mean not children but self- conscious men. When we speak of good, we include a knowledge of it. Now, the natural or the ingenuous is of itself neither good nor evil, but when related to will, as freedom and knowledge of freedom, it is not free, and hence evil. When the natural is willed by man, it is no longer simply the natural, but the negative of the good, or the negative of the conception of the will. If we were to say that, since evil lies in the conception, and exists of necessity, men are no longer responsible when they adopt it, it must be replied that their decision is their own deed, the act of their freedom, and therefore to be laid at their door. In religious fable it is said that man is like God in his having a knowledge of good and evil. The resemblance to God is a fact so far as the necessity is not a necessity of nature, but rather a decision transcending the state in which good and evil are involved alike. Since both good and evil confront me, I may choose either, resolve upon either, and take up either into my subjectivity. It is the nature of evil that man may will it, although he is not forced by necessity to do so.

140. As every end belongs to the purpose of actual concrete action, it necessarily has a positive side (§130), which self-consciousness knows on occasion how to bring forward. But as self- consciousness implies a turning back into oneself, and is aware of the universal of the will, an act has also a negative side. The positive side of an act, whose negative content stands in

open contrast with the universal, may be looked on as a duty and an excellent motive, and be maintained by self-consciousness to be good for others as well as for itself. To hold it good for others is hypocrisy; and to hold it good for itself is a still higher summit of the subjectivity, which maintains itself to be the absolute. Note. The final most abstruse form of evil, that in which evil is turned into good and good into evil, in which, too, consciousness knows itself as the transforming power, and therefore as absolute, is the very summit of subjectivity from the moral standpoint. It is the form to which evil has risen in our time, and that, too, through philosophy, or rather a shallowness of thought, which has contorted a deep conception, and presumes to give itself the name of philosophy, just as it presumes to give to evil the name of good. In this note I shall mention briefly the chief forms of this subjectivity, which are in vogue. (a) Dissimulation, or hypocrisy. In it are contained the following elements: (a) knowledge of the true universal, whether it be in the form of the feeling of right and duty, or in the form of a thorough knowledge of them; (b) the willing of the particular, which is in open strife with the universal; and (g) explicit comparison of the universal and particular, so that, for the willing consciousness itself, its particular will is understood to be evil. These three elements comprise the act done with evil conscience, but are not yet hypocrisy as such. It was at one time a very important question whether an act is evil only in as far as it is done with an evil conscience, i.e., with a developed consciousness of the elements involved in the act. Pascal ("Les Provinc." 4e lettre) well draws out the consequences of an affirmative answer to this question. He says, "Ils seront tous damnés ces demi pécheurs, qui ont quelque amour pour la vertu. Mais pour ces francs-pécheurs, pécheurs endurcis, pécheurs sans mélange, pleins et achevés, l'enfer ne les tient pas: ils ont trompé le diable à force de s'y abandonner."

6 The subjective right of self-consciousness, to know whether the act falls under the category of good or evil, must not be thought of as colliding with the absolute right of the objectivity of this category. At least, the two are not to be represented as separable, indifferent to each other, and related only casually. And yet this is just the view which lay at the basis of the old-time question about saving grace. [Wirksame Gnade.] Evil on its formal side is that which is most peculiarly the individual's own, since it is his subjectivity setting itself up as wholly and purely its own. For it he is, therefore, responsible (§139 and note). On the objective side, man in his conception as spirit is rational, and has solely inhimself a universality, which is aware of itself. Hence we fail to treat him in accordance with the dignity of his conception, when we separate from him either the goodness of a good act or the evil of an evil act, and refuse to impute it to him as good or evil. How definite may be the consciousness of these two distinguishable sides in man, with what degree of clearness or obscurity this consciousness may become knowledge, or how far in an evil act conscience may be formal, are questions with which we are not much concerned. They belong to the empirical side of the subject-matter. (b) But evil and to act with evil conscience are not yet hypocrisy. We must add the formal phase of untruth, in which evil is maintained to be good and good for others. The agent represents as good, conscientious, and pious an act, which is merely an artifice for the betrayal of others. But by means of what is otherwise good and pious, namely, by good reasons generally, an evil man may find a justification of his evil, transforming evil into something good for himself. The possibility of such a transformation is found in the abstract and negative subjectivity, which is conscious that all phases must submit to and spring from it. (c) Allied to the foregoing is what is known as probability. Its principle is that if consciousness can trump up one good reason, be it only the authority of a single theologian, whose judgment, it may be, is

disapproved by others, the act is permissible, and conscience may be at ease. Such a reason or authority, it is acknowledged, gives at best only probability, but that is supposed to be enough to confirm the conscience. It is admitted also that a good reason does not exclude others, which may be quite as good. Further, in this form of subjectivity there is a touch of the objective in the concession that conduct should be based on a ground or reason. But to the many good reasons and authorities, which might be adduced in favour of a certain line of action, may be opposed just as many good reasons for an opposite course. Hence the decision is intrusted not to the objectivity of the thing, but to subjectivity; liking and caprice are made the discerners between good and evil, and ethical observance and religion are undermined. But since it is given out that some reason, and not private subjectivity, is the basis of decision, probability is so far a form of hypocrisy. (d) The next higher stage is the assertion that the good will shall consist in willing the good; the willing of the abstract good shall be the sole requisite for a good act. Since the act, as a definite volition, has a content, while the abstract good determines nothing, it devolves upon the private individual to give the good filling and definiteness. In probability there must be obtained from some Reverend Père authority to bring a definite content under the general category of the good. But here every subject, simply as he stands, is invested with the dignity of giving a content to the abstract good, or, what is the same thing, of bringing a content under the universal. But this content is only one of several sides of a concrete act, which may, on another of its sides, be bad or criminal. And yet my subjective estimate of the good is the good as known by me in the act; it is my good intention (§111). Thus arises an opposition between different phases, in accordance with one of which the act is good, but in accordance with another, criminal. Here, too, would seem to come up the question, if, in the actual act, the intention is really good. But at this standpoint, at which

abstract good is the determining motive, the good not only may but must be the real intention. And, however bad and criminal they may be in other directions, the results of an act, which completes a good intention, are also good. We seem forced to ask which of these sides is essential. But this objective question cannot here be put; or rather the only objective is the decision of the subjective consciousness itself. Besides, at this standpoint the terms essential and good have the same meaning. Both are abstractions. Good is that which in regard to the will is essential; and the essential in regard to the will is that an act shall be for me good. But here one may place any pleasurable content he likes under the abstract good, because this good, having no content of its own, is reduced to mean merely a bare positive, something, that is, which may have value from some point of view, and also in its direct phase may be made to count as an essential end. Such a positive action might be, e.g., to do good to the poor, or to provide for myself, my life, or my family. Further, as the good is abstract, the bad also must be without content, and must receive definiteness from my subjectivity. Hence arises the moral end to hate and root out the bad. Theft, cowardice, murder, as acts of a subjective will, imply at the very outset the satisfaction of this will, and are therefore something positive. Now, that the act may be good, I simply need to know this positive side of it as my intention. Hence the act is at once decided to be good, because to know it as good is involved in my intention. Theft for the benefit of the poor, theft or flight from battle, in order to fulfil the duty of caring for one's life or one's family, which may be poor, murder through hate and revenge, i.e., to satisfy a sense of right, or of my right, or of the wickedness of another, or to satisfy a sense of the wrong done by him to me or others, or the world, or people generally, by extirpating him as thoroughly bad, and thus contributing something to the extermination of evil, — all these acts are on their positive side good in intention and so good in act. There is needed a superlatively small effort of

the understanding to discover, as did the learned divines aforesaid, for every act a positive side, and a good reason or intention. Hence it has been said that there are no evil men, because no one wills evil for evil's sake, an act which would be purely negative. He always wills something positive, and therefore, from this point of vision, good. In this abstract good the distinction between good and evil, and all real duties also, have disappeared. Accordingly, merely to will the good, merely to have a good intention when we act, is evil because the willed good is an abstraction, and the ascertainment of what is good is left to the caprice of the subject. To this place belongs the famous sentence, "The end justifies the means." This expression, as it stands, is trivial, because one could as vaguely reply that a just end justifies the means, but an unjust end does not. The expression would then be tautological, since the means, if they are real means, are nothing of themselves but are only for the sake of something else, from which they derive their worth. But this saying is not meant in a merely formal and indefinite sense. It justifies the use for a good end of something not strictly a means at all. It justifies and inculcates as a duty even crime and the violation of what is of itself just, as means for effecting a good end. In this saying there floats a general consciousness of the dialectic of the positive element, alluded to above, as it bears upon right and ethics, and upon such indefinite propositions as "Thou shalt not kill," "Thou shalt care for thy own well-being and that of thy family." In law and war, to kill is not only a right but a duty; but in these cases there is an accurate description of the circumstances under which, and also of the kind of men whom it is permitted or enjoined to kill. In the same way my well-being and the well-being of my family must yield to higher ends, and be reduced to means. But a crime is not an indistinct generality, which has to undergo a process of dialectic, but something definitely and objectively limited. Yet the end which is to oppose this crime and deprive it of its nature, the holy and just

end, is only the subjective opinion of what is good or better. Thus, here again the will holds to the abstract good; and every absolutely valid mark of the good and bad, of right and wrong, is superseded by and handed over to the feeling, opinion, and liking of the individual. (e) Subjective opinion is openly pronounced to be the rule of right and duty, when the conviction that a thing is right is declared to be the criterion of the ethical character of an act. As the good, which is here willed, is still without content, the principle of conviction implies that it is simply for the subject to decide whether the act is good or not. Thus here also all semblance of ethical objectivity has vanished. Such a theory has direct affinity with the so-called philosophy, already repeatedly alluded to, which denies the possibility of knowing the truth, and, in so doing, denies also the moral laws, which are the truth and reason of spirit as will. Such philosophizing, as it proclaims a knowledge of the truth to be vanity, and the circle of knowledge to be mere appearance, must obviously make appearance the principle of action also. Thus ethical principles are decided by the individual's peculiar view of life and his private conviction. This degradation of philosophy appears, indeed, to outsiders as of supremely small importance, and to be confined merely to the idle talk of the school. But the view necessarily makes its way into ethics, which is an essential part of philosophy. The real world sees the meaning of these views only when they have become a reality. By the spread of the view that subjective conviction alone decides the ethical value of an act, it has come to pass that hypocrisy, formerly much discussed, is now hardly spoken of at all. To mark hypocrisy as evil is to believe that certain acts are beyond all question trespasses, vices, and crimes; that also, he who commits them must know what they are, knowing and recognizing, as he does, the principles and outward acts of piety and right, even in the false guise under which he misuses them. Or, perhaps, with regard to evil, it was assumed that it is a duty to know the good and to distinguish it from

evil. In any case it was unconditionally claimed that men should do nothing vicious or criminal, and that if they did, they must, just so far as they are men, not cattle, be held responsible. But when the good heart, good intentions, and subjective conviction are said to decide the value of action, there is no longer any hypocrisy, or, for that matter, evil at all. Since whatever an individual does he can convert into good by the reflective intervention of good intentions and motives; and by virtue of his conviction his act is good.[7] There is no longer any absolute vice or crime. Instead of frank and free, hardened and untroubled transgression[8] appears the consciousness of complete justification through intention and conviction; my good intention and my conviction that the act is good make it good. To pass sentence upon an act is merely to judge of the intention, conviction, or faith of the agent. Faith is not used here in the sense in which Christ demands faith in objective truth. In that sense, if a man has a bad faith, i.e., a conviction which is in its content evil, he must accordingly be condemned. But faith here means simply fidelity to conviction. When we ask if a man has remained true to his conviction, we refer to the merely formal subjective faith, which is supposed of itself to contain his duty. Because the principle of conviction is subjective, there is forced upon us the thought of the possibility of error, and in this thought is the implication of an absolute law. But a law does not act; it is only a real human being who acts. If we are to estimate the worth of his acts according to this subjective principle, we can ask merely how far he has embodied the law in his conviction. Thus, if the acts are not to be judged and measured according to the law, it is not easy to perceive what purpose the law subserves. It is degraded to a mere external letter or empty word; and inevitably, since it is made a binding law and obligation only by my conviction. Such a law may have the authority of God, of the state, and of centuries, in which it united men and gave substance to their acts and destiny. It may thus include the

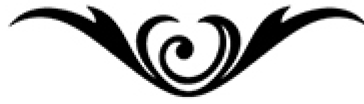
convictions of an untold number of individuals. And yet to it I oppose the authority of my private conviction — a conviction which has no other footing than authority. This, to all appearance, stupendous presumption is ignored by the principle which makes subjective conviction to be the rule. Although reason and conscience, never wholly driven away by shallow science and sophistry, with bad logic but a higher insight concede the possibility of error, they yet reduce crime and evil to a minimum by calling them errors. To err is human. Who has not often erred with regard to one thing and another, whether yesterday at dinner he had fresh or pickled cabbage, and in numberless other things of greater or less importance? And yet the distinction between important and unimportant vanishes, if we cling obstinately to mere subjective conviction. But the natural, though illogical, admission of the possibility of error, when it allows that a bad conviction is only an error, is turned into another defect of logic, that, namely, of dishonesty. At one time it is said that upon subjective conviction rests the ethical structure and the highest worth of man, and this conviction is declared to be most high and holy. At another time we are dealing with a mere error, and my conviction has become trivial, contingent, and accidental. In point of fact my conviction is of trifling moment if I cannot know the truth. In such a case it is also a matter of indifference how I think, and there remains for my thought merely that empty good, which is an abstraction of the understanding. The principle of justification on the ground of conviction bears also upon others in their treatment of my action. They are quite right to hold my acts to be crimes, if this is in accordance with their belief and conviction. Thus I not only cannot anticipate any favourable treatment, but, on the contrary, am reduced from a position of freedom and honour to one of dishonour and slavery. And this happens through that very justice which I have adopted as my own, by the exercise of which I experience only an alien subjective conviction, and the working

of a merely external force. (f) Finally, the highest form in which this subjectivity fully grasps and expresses itself, is that which we, borrowing the name from Plato, have called irony. But it is only the name which is taken from Plato, who, like Socrates, used it in personal conversation against the opinions of the ordinary and of the sophistic consciousness, in order to bring out the idea of truth and justice; but in treating the superficial consciousness in this way he expressly excepts the idea. Irony is employed by him in conversation, only against persons; otherwise the essential movement of his thought is dialectic. So far was Plato from supposing the conversational process to be complete in itself, or irony to be the idea or ultimate form of thought, that he, on the contrary, terminated the backward and forward motion of thought, which prevails in subjective opinion, by sinking it in the substantive idea.9 The summit of the subjectivity, which apprehends itself as ultimate, consists in a consciousness of itself as judge of truth, right, and duty. It is aware, indeed, of the objective ethical principle, but does not forget or renounce itself, or make any earnest effort to sink itself in this principle and act from it. Although it is in relation to this principle, it holds itself free from it, and is conscious of itself as willing and deciding in a certain way, and as being able quite as well to will and decide otherwise. You, let us suppose, honestly take a law to be something absolute; but, as for me, I too have a share in it, but a much grander one than you, for I have gone through and beyond it, and can turn it as I please. It is not the subject-matter which is excellent, but I am the excellent thing, and am master of law and fact. I toy with them at my pleasure, and can enjoy myself only when I ironically know and permit the highest to be submerged. This form, indeed, makes vain the whole ethical content of right, duty, and law, being an evil and in itself a wholly universal evil. Yet to it we must add the subjective vanity of knowing itself as empty of all content, and yet of knowing this empty self as the absolute. This absolute

self-complacency may in some cases pass beyond a solitary worship of itself, and frame some kind of community, the bond and essence of which would be the mutual asseveration of conscientiousness, good intentions, and reciprocal delight in purity. The members of this union would disport themselves in the luxury of self-knowledge and self- utterance, and would cherish themselves to their heart's content. In those persons, who have been called beautiful souls, we find even a more sublime subjectivity, making void all that is objective and shining by the light of its own unreality. These and other phases, which are in some measure connected with the foregoing forms of subjectivity, I have treated in the "Phänomenologie des Geistes." In that work the whole section on Conscience, especially the paragraphs dealing under a different heading with the transition into a higher stage, may be compared with the present discussion. Addition. Imagination may go further and convert the evil will into the pretence of the good. Though it cannot alter the substance of evil, it can lend to it the outer form and semblance of good. Every act contains something positive, and the demonstration that a thing is good, as opposed to evil, is effected by eliminating all but this positive. Thus I can maintain an act to be good in respect of my intention. Moreover, not only in consciousness, but also on the positive practical side of action, evil is connected with good. If self-consciousness gives out that the act is good only for others, it assumes the form of hypocrisy. But if it ventures to maintain that the act is good for itself, it rises to the still higher summit of a subjectivity, which is conscious of itself as absolute. For it good and evil, as they are in and of themselves, have wholly disappeared, and it can, therefore, give itself out for what it pleases. This is the standpoint of absolute sophistry, which itself assumes the style of lawgiver, and refers the distinction between good and evil to caprice. Most pronounced in hypocrisy are the religious dissemblers, the Tartüffes, who perform all kinds of ceremonies, and are in their own eyes

pious, although doing what they please. To- day we seldom speak of hypocrites, partly because the accusation seems too strong, but also because hypocrisy in its direct form has disappeared. Direct falsehood and complete cloaking of the good have become too transparent. Nor is the total severance of good and evil any longer so simple and available, since their limits have been made uncertain by growing culture. The more subtle form of hypocrisy now is that of probability, by which one seeks to represent a transgression as something good for his own conscience. This occurs only where morals and the good are fixed by authority, so that the reasons for maintaining the evil to be the good are as numerous as the authorities. Casuistic theologians, especially Jesuits, have worked up these cases of conscience, and multiplied them ad infinitum. Owing to this over-subtlety, good and evil come into collision, and are subject to such fluctuations that they seem to the individual to run into each other. The chief desideratum is only what is probable, an approximate good, for which a single reason or authority can be secured. Another peculiarity of this standpoint is that it contains only what is abstract, while the concrete filling is represented as unessential, or rather is left to mere opinion. Thus anyone may have committed a crime and yet willed the good. When, for instance, a wicked person is murdered, the positive side of the act may be asserted to be a desire to oppose and diminish evil. The next stage of probability is reached when the subject depends not upon the authority and assertion of another, but upon himself. He relies upon his own conviction, and his belief that only through his conviction can a thing be good. The defect of this attitude is the determination to refer to nothing but the conviction itself, involving a rejection of the substance of absolute right, and a retention of the mere form. It is, of course, not a matter of indifference whether I do something through use and wont, or through the force of its truth. Yet objective truth is different from my conviction. Conviction holds no distinction at all between

good and evil, for it is always only conviction; the bad would be only that of which I am not convinced. This highest standpoint, in extinguishing good and evil, is admittedly exposed to error, and is cast down from its high estate to mere contingency and disregard. This is irony, the consciousness that the highest criterion, the principle of conviction, is ruled by caprice, and is, therefore, ineffective. For this view the philosophy of Fichte is chiefly responsible, as it claims that the I is absolute. At least it maintains that absolute certitude marks the general condition of the I, which by a further development passes into objectivity. Of Fichte, however, it cannot properly be said that in the practical realm he has made the caprice of the subject a principle. But after him the particular, interpreted as the condition of the individual subject, and applied by Friedrich v. Schlegel to the good and beautiful, has been set up as God. Hence the objective good is only an image formed by my conviction, receiving its substance only through me, and appearing and vanishing at the pleasure of me, its lord and master. The objective, to which I am related, is brought to naught, and thus I hover over a dim and monstrous space, calling up phantoms and dispersing them at will. This last extreme of subjectivity arises only at a time of high culture, where serious faith has crumbled away, and all things have become vanity.



Transition from Morality to Ethical System.

141. In behalf of conscience, or the mere abstract principle of determination, it is demanded that its phases shall be universal and objective. In the same way in behalf of the good which, though it is the essential universal of freedom, is still abstract, are also required definite phases; and for these phases is further demanded a principle which must, however, be identical with the good. The good and conscience, when each is raised into a separate totality, are void of all definiteness, and yet claim to be made definite. Still, the construction of these two relative totalities into

an absolute identity is already accomplished in germ, since even the subjectivity or pure self-certitude, which vanishes by degrees in its own vacuity, is identical with the abstract universality of the good. But the concrete identity of the good and the subjective will, the truth of these two, is completed only in the ethical system. Note. A more detailed account of the transition of the conception is to be found in the "Logic." Here it is enough to say that the limited and finite by its very nature contains the opposite in itself. Such a finite thing is either the abstract good, which is as yet unrealized, or the abstract subjectivity, which is good only in intention. Abstract good implicitly contains its opposite, i.e., its realization, and abstract subjectivity, or the element in which the ethical is realized, implicitly contains its opposite, i.e., the good. Thus, when either of these two is taken in a onesided way, it has not yet positively realized all that it is capable of being. The good, apart from all subjectivity and definite character, and the determining subjectivity, apart from anything that it may become, arrive at a higher actuality by a negative process. Each clings at first to its one-sided form, and resolves not to accept what it possesses potentially, thus constituting itself an abstract whole. Then it annuls itself in that capacity, and thereby reduces itself to the level of one element in a whole. Each of them becomes one element of the conception. The conception, in turn, is manifested as their unity, and, having received reality through the establishment of its elements, now exists as idea. The idea is the conception, when it has fashioned its elements into reality, and at the same time exists in their identity as their dynamic essence. The simplest realization of freedom is right. When self-consciousness is turned back upon itself, freedom is realized as the good. The third stage, which is here in its transition exhibited as the truth of the good and of subjectivity, is likewise quite as much the truth of right. The ethical is subjective disposition, and yet contains right implicitly. But that this idea is the truth of

the conception of freedom must not be an assumption derived from such a source as feeling, but must in philosophy be demonstrated. This demonstration is made only when right and the moral self-consciousness are proved to exhibit of themselves the tendency to run back into this idea as their result. Those who believe that proof and demonstration can be dispensed with in philosophy, show that they are still a long distance from the first thought of what philosophy is. They may speak of other things indeed, but they have no right to discuss philosophy, if they have not understood the conception. Addition. The two principles which we have so far considered, both the abstract good and conscience, are as yet without their opposing principles. The abstract good is etherealized into something wholly devoid of power, something into which I can introduce any content at all. And the subjectivity of spirit is equally without content, since it has no objective significance. Hence there may arise a longing after objectivity. Man would debase himself to the complete dependence of a serf, in order to escape the torment of sheer inanity and negativity. Many Protestants recently passed over to the Catholic church, simply because they found no substance in their own inner life. They were willing to accept any fixed and tangible authority, even though it had not the security which comes from thought. The social order is the unity, and according to the conception the reconciliation also of the subjective good with the objective absolute good. Morality is the general form of the will as subjective; but the ethical order is not simply the subjective form and the self-determination of the will, but contains their conception, namely, freedom. Neither right nor morality can exists independently, but must have the ethical as its pillar and support. In right is wanting the element of subjectivity, and in morality is wanting the objective, so that neither by itself has any actuality. Only the infinite, the idea is actual. Right exists only as a branch of a whole, or as a vine twining itself about a firmly rooted tree.

Third Part: The Ethical System.

142. THE ETHICAL system is the idea of freedom. It is the living good, which has in self- consciousness its knowing and willing, and through the action of self-consciousness its actuality. Self-consciousness, on the other hand, finds in the ethical system its absolute basis and motive. The ethical system is thus the conception of freedom developed into a present world, and also into the nature of self-consciousness.

143. The conception of the will, when united with the realization of the will, or the particular will, is knowing. Hence arises the consciousness of the distinction between these two phases of the idea. But the consciousness is now present in such a way that each phase is separately the totality of the idea, and has the idea as its content and foundation.

144. The objective ethical principle which takes the place of the abstract good is in its substance concrete through the presence in it of subjectivity as its infinite form. Hence it makes differences which are within itself, and therefore are due to the conception. By means of these differences, it obtains a sure content, which is independent and necessary, and reaches a standing ground raised above subjective opinion and liking. This content is the self-originated and self- referring laws and regulations. Addition. In the ethical principle as a whole occur both the objective and the subjective elements; but of this principle each is only a form. Here the good is substance, or the filling of the objective with subjectivity. If we contemplate the social order from the objective standpoint, we can say that man, as ethical, is unconscious of himself. In this sense Antigone proclaims that no one knows whence the laws come; they are everlasting, that is, they exist absolutely, and flow from the nature of things. None the less has this

substantive existence a consciousness also, which, however, is only one element of the whole.

145. The ethical material is rational, because it is the system of these phases of the idea. Thus freedom, the absolute will, the objective, and the circle of necessity, are all one principle, whose elements are the ethical forces. They rule the lives of individuals, and in individuals as their modes have their shape, manifestation, and actuality. Addition. Since the phases of the ethical system are the conception of freedom, they are the substance or universal essence of individuals. In relation to it, individuals are merely accidental. Whether the individual exists or not is a matter of indifference to the objective ethical order, which alone is steadfast. It is the power by which the life of individuals is ruled. It has been represented by nations as eternal justice, or as deities who are absolute, in contrast with whom the striving of individuals is an empty game, like the tossing of the sea.

146. (b) This ethical reality in its actual self-consciousness knows itself, and is therefore an object of knowledge. It, with its laws and forces, has for the subject a real existence, and is in the fullest sense self-dependent. It has an absolute authority or force, infinitely more sure than that of natural objects. Note. The sun, moon, mountains, rivers, and all objects of nature doubtless exist. They not only have for consciousness the authority of existence in general, but have also a particular nature. This nature consciousness regards as valid, and in its varied relation and commerce with objects and their use comports itself accordingly. But the authority of the social laws is infinitely higher, because natural things represent reason only in a quite external and particular way, and hide it under the guise of contingency.

147. On the other hand, the various social forces are not something foreign to the subject. His spirit bears witness to them as to his own being. In them he feels that he is himself, and in them, too, he lives as in an

element indistinguishable from himself. This relation is more direct and intuitive than even faith or trust. Note. Faith and trust belong to the beginning of reflection, presupposing picture thought and such discernment as is implied in the judgement that to believe in a heathen religion is different from being a heathen. The relation, or rather identity without relation, in which the ethical principle is the actual life of self-consciousness, can indeed be transformed into a relation of faith and conviction. By further reflection, also, it may pass into an insight based on reasons, which originate in some particular end, interest, or regard, in fear or hope, or in historical presuppositions. But the adequate knowledge of these belongs to the conception arrived at through thought.

148. The individual may distinguish himself from these substantive ethical factors, regarding himself as subjective, as of himself undetermined, or as determined to some particular course of action. He stands to them as to his substantive reality, and they are duties binding upon his will. Note. The ethical theory of duties in their objective character is not comprised under the empty principle of moral subjectivity, in which, indeed, nothing is determined (§134), but is rightly taken up in the third part of oxir work, in which is found a systematic development of the sphere of ethical necessity. In this present method of treatment, as distinguished from a theory of duties, the ethical factors are deduced as necessary relations. It is, then, needless to add, with regard to each of them, the remark that it is thus for men a duty. A theory of duties, so far as it is not a philosophic science, simply takes its material out of the relations at hand, and shows how it is connected with personal ideas, with widely prevalent principles, and thoughts, with ends, impulses, and experiences. It may also adduce as reasons the consequences, which arise when each duty is referred to other ethical relations, as well as to general well-being and common opinion. But a theory of duties, which keeps to the logical settlement of its own inherent

material, must be the development of the relations, which are made necessary through the idea of freedom, and are hence in their entire context actual. This is found only in the state.

149. A duty or obligation appears as a limitation merely of undetermined subjectivity and abstract freedom, or of the impulse of the natural will, or of the moral will which fixes upon its undetermined good capriciously. But in point of fact the individual finds in duty liberation. He is freed from subjection to mere natural impulse; he is freed from the dependence which he as subjective and particular felt towards moral permission and command; he is freed, also, from that indefinite subjectivity, which does not issue in the objective realization implied in action, but remains wrapped up in its own unreality. In duty the individual freely enters upon a liberty that is substantive. Addition. Duty limits only the caprice of subjectivity, and comes into collision only with abstract good, with which subjectivity is so firmly allied. When men say we will to be free, they have in mind simply that abstract liberty, of which every definite organization in the state is regarded as a limitation. But duty is not a limitation of freedom, but only of the abstraction of freedom, that is to say, of servitude. In duty we reach the real essence, and gain positive freedom.

150. The ethical, in so far as it is reflected simply in the natural character of the individual, is virtue. When it contains nothing more than conformity to the duties of the sphere to which the individual belongs, it is integrity. Note. What a man ought to do, or what duties he should fulfil in order to be virtuous, is in an ethical community not hard to say. He has to do nothing except what is presented, expressed and recognized in his established relations. Integrity is the universal trait, which should be found in his character, partly on legal, partly on ethical grounds. But from the standpoint of morals a man often looks upon integrity both for himself and others as secondary and unessential. The longing to be unique and peculiar is not

satisfied with what is absolute and universal, but only with some situation that is exceptional. The name “virtue” may quite as well be applied to the different aspects of integrity, because they, too, although they contain nothing belonging exclusively to the individual in contrast with others, are yet his possession. But discourse about the virtues easily passes into mere declamation, since its subject-matter is abstract and indefinite, and its reasons and declarations are directed to the individual’s caprice and subjective inclination. In any present ethical circumstance, whose relations are fully developed and actualized, virtue in the strict sense has place and reality only when these relations come into collision. But genuine collisions are rare, although moral reflection can, on the slightest provocation, create them. It can also provide itself with the consciousness that, in order to fulfil its special mission, it must make sacrifices. Hence, in undeveloped conditions of social life virtue as such occurs more frequently, because ethical principles and the realization of them are more a matter of private liking, belonging indeed to the nature of peculiarly gifted individuals. Thus, the ancients have attributed virtue in a special way to Hercules. So, too, in the ancient states, where ethical principles had not expanded into a system of free self-dependent development and objectivity, ethical defects had to be compensated for by the genius of the private individual. Thus the theory of the virtues, so far as it differs from a mere theory of duties, embraces the special features of character due to natural endowments, and thus becomes a spiritual history of the natural in man. Since the virtues are the ethical reality applied to the particular, and are on this subjective side indefinite, there arises, in order to make them definite, a quantitative distinction of more and less. Hence the consideration of the virtues calls up the opposing vices as defects; Thus Aristotle defines a particular virtue, when rightly understood, as the mean between too much and too little. The content, which receives the form of duties and also of virtues, is the same as that

which has the form of appetites (§19, note). Besides, they all have the same content as their basis. But because the content of the appetites still belongs to unformed will and natural perception, and is not developed to an ethical order, the only object which they have in common with the content of duties and virtues is abstract. Since it in itself is indeterminate, it does not contain for the appetites the limits of good and evil. Thus appetites, if we consider their positive side, are good, if their negative side evil (§18). Addition. If a man realizes this or that social project, he is not at once virtuous, though such, indeed, he is, when this way of behaving is a fixed element of his character. Virtue is not wholly objective; it is rather ethical virtuosity. To-day we do not speak of virtue as formerly, for the reason that ethical principles are not now so much a feature of a particular individual. The French speak most of virtue, because amongst them the individual is more his own peculiar property, and acts according to the dictates of nature. The Germans, on the other hand, are more reflective, and amongst them the same content attains the form of universality.

151. The ethical, when simply identical with the reality of individuals, appears as a generally adopted mode of action, or an observance. This is the custom, which as a second nature has been substituted for the original and merely natural will, and has become the very soul, meaning, and reality of one's daily life. It is the living spirit actualized as a world; by this actualization does the substance of spirit exist as spirit. Addition. As nature has its laws, as the animals, trees, the sun, fulfil their law, so observance belongs to the spirit of freedom. What right and morality are not as yet, the ethical principle is, namely, spirit. The particularity involved is not yet that of the conception, but only of the natural will. So, too, from the standpoint of morality, self-consciousness is not yet spiritual consciousness. It is occupied simply with the value of the subject in himself; the subject, who frames himself according to the good and against evil, has yet the form of

caprice. But, here at the ethical point of view, will is the will of spirit, and has a correspondingly substantive content. Pedagogy is the art of making men ethical. It looks upon man as natural, and points out the way in which he is to be born again. His first nature must be converted into a second spiritual nature, in such a manner that the spiritual becomes in him a habit. In the spiritual disposition the opposition of the natural and subjective will disappears, and the struggle of the subject ceases. To this extent habit belongs to ethics. It belongs also to philosophic thought, which demands that the mind should be armed against sallies of caprice, rout and overcome them, in order that rational thought may nave free course. It is true, on the other hand, that mere habit causes death, which ensues when one gets thoroughly used to life, and has become physically and mentally dulled. Then the opposition due to subjective consciousness and spiritual activity has disappeared. Man is active only in so far as he has not attained something which he desires to effect. When this is fully accomplished, activity and vitality vanish, and the lack of interest, which then pervades him, is mental or physical death.

152. Substantive ethical reality attains its right, and this right receives its due, when the individual in his private will and conscience drops his self-assertion and antagonism to the ethical. His character, moulded by ethical principles, takes as its motive the unmoved universal, which is open on all its sides to actual rationality. He recognizes that his worth and the stability of his private ends are grounded upon the universal, and derive their reality from it. Subjectivity is the absolute form and the existing actuality of the substance. The difference between the subject and substance, as the object, end, and power of the subject, forthwith vanishes, like the difference between form and matter. Note. Subjectivity, which is the foundation for the real existence of the conception of freedom (§106), is at the moral

standpoint still distinguished from the conception. In ethics it is adequate to the conception, whose existence it is.

153. In that individuals belong to the ethical and social fabric they have a right to determine themselves subjectively and freely. Assurance of their freedom has its truth in the objectivity of ethical observance, in which they realize their own peculiar being and inner universality (§147). Note. To a father seeking the best way to bring up his son, a Pythagorean, or some other thinker, replied, “Make him a citizen of a state which has good laws.” Addition. The attempts of speculative educators to withdraw people from their present social life and bring them up in the country, a proposal made by Rousseau in “Emile,” have been vain, because no one can succeed in alienating man from the laws of the world. Although the education of young men must take place in solitude, we cannot believe that the odour of the world of spirits does not in the end penetrate their seclusion, or that the power of the spirit of the world is too feeble to take possession of even the remotest corner. Only when the individual is a citizen of a good state, does he receive his right.

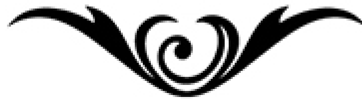
154. The right of individuals to their particularity is contained in the concrete ethical order, because it is in particularity that the social principle finds a visible outer manifestation.

155. Right and duty coincide in the identity of the universal and the particular wills. By virtue of the ethical fabric man has rights, so far as he has duties, and duties so far as he has rights. In abstract right, on the contrary, I have the right and another person the corresponding duty; and in morals I resolve to consider as an objective duty only the right of my own knowledge and will and of my own well-being. Addition. The slave can have no duties, but only the free man. If all rights were on one side and all duties on the other, the whole would be broken up. Identity is the only principle to which we must now adhere.

156. The ethical substance, as the union of self-consciousness with its conception, is the actual spirit of a family and a nation. Addition. The ethical framework is not abstract like the good, but in a special sense real. Spirit has actuality, and the accidents or modes of this actuality are individuals. Hence as to the ethical there are only two possible views. Either we start from the substantive social system, or we proceed atomically and work up from a basis of individuality. This latter method, because it leads to mere juxtaposition, is void of spirit, since mind or spirit is not something individual, but the unity of individual and universal.

157. The conception of this idea exists only as spirit, as active self-knowledge and reality, since it objectifies itself by passing through the form of its elements. Hence it is, A. The direct or natural ethical spirit, the family. This reality, losing its unity, passes over into dismemberment, and assumes the nature of the relative. It thus becomes B. The civic community, an association of members or independent individuals in a formal universality. Such an association is occasioned by needs, and is preserved by the law, which secures one's person and property, and by an external system for private and common interests. C. This external state goes back to, and finds its central principle in, the end and actuality of the substantive universal, and of the public life dedicated to the maintenance of the universal. This is the state-constitution.

First Section: The Family.



158. THE FAMILY is the direct substantive reality of spirit. The unity of the family is one of feeling, the feeling of love. The true disposition here is that which esteems the unity as absolutely essential, and within it places the consciousness of oneself as an individuality. Hence, in the family we are not independent persons but members. Addition. Love is in general the consciousness of the unity of myself with another. I am not separate and isolated, but win my self-consciousness only by renouncing my independent existence, and by knowing myself as unity of myself with another and of another with me. But love is feeling, that is to say, the ethical in the form of the natural. It has no longer a place in the state, where one knows the unity as law, where, too, the content must be rational, and I must know it. The first element in love is that I will to be no longer an independent self-sufficing person, and that, if I were such a person, I should feel myself lacking and incomplete. The second element is that I gain myself in another person, in whom I am recognized, as he again is in me. Hence love is the most tremendous contradiction, incapable of being solved by the understanding. Nothing is more obstinate than this scrupulosity of self-consciousness, which, though negated, I yet insist upon as something positive. Love is both the source and solution of this contradiction. As a solution it is an ethical union.

159. A right, which comes to the individual by reason of the family and constitutes his life in it, does not appear in the form of a right, that is, the abstract element of a definite individuality, until the family is dissolved. Then those, who should be members, become in feeling and reality self-dependent persons. What was theirs by right of their position in the family,

they now receive in separation in an external way, in the form of money, maintenance, or education. Addition. The family has this special right, that its substantive nature should have a sphere in actuality. This right is a right against external influences and against abandonment of the unity. But, on the other hand, love is subjective feeling, which, if it oppose the unity of the family, destroys it. If in such a case a unity is insisted on, it can comprehend only things that are external and independent of feeling.

160. The family when completed has the three following Phases: (a) The form of its direct conception, marriage. (b) External reality, the family property and goods and the care of them. (c) Education of children and dissolution of the family.

A. Marriage.

161. MARRIAGE, AS the elementary social relation, contains firstly the factor of natural life. As marriage is also a substantive fact, natural life must be viewed, in its totality as the realization of the species, and the process which the realization involves. But, secondly, the merely inner, potential and, when actualized, external unity of the sexes is transformed in self-consciousness into the spiritual unity of self-conscious love. Addition. Marriage is essentially an ethical relation. Formerly, in the majority of what are called rights of nature, marriage was interpreted on its physical or natural side. It has thus been looked upon simply as a sexual relation, and as excluding all the other features of marriage. But such a view is no more crude than to conceive of marriage merely as civil contract, a view found in Kant. In accordance with this view, individuals form a compact through mere caprice, and marriage is degraded to a bargain for mutual use. A third doctrine, equally reprehensible, bases marriage on love only. Love, which is feeling, admits the accidental on every side, as the ethical cannot do. Hence, marriage is to be defined more exactly as legal ethical love. Out of marriage has disappeared the love, which is merely subjective.

162. As a subjective starting-point for marriage either the special inclination of two persons for each other may be the more observable, or else the provision and general arrangements of the parents. The objective point of departure, however, is the free consent of the two to become one person. They give up their natural and private personality to enter a unity, which may be regarded as a limitation, but, since in it they attain to a substantive self-consciousness, is really their liberation. Note. That an individual may be objective, and so fulfil his ethical duty, he should marry.

The circumstances attending the external starting-point are naturally a matter of chance, depending largely upon the state of reflective culture. In this there may be either of two extremes. Either well-meaning parents arrange beforehand for the marriage of two persons, who, when they have made each other's acquaintance as prospective husband and wife, are then expected to love each other. Or, on the other hand, inclination is supposed first to appear in the two persons, left absolutely to their private selves. The extreme, in which marriage is resolved on prior to inclination, and both resolution and inclination are then present in the actual marriage, is the more ethical. In the other extreme, it is the individual's private and unformed nature, which makes good its pretensions. This extreme is in close alliance with the subjective principle of the modern world (§124, note). Modern dramas and other works of art produce an atmosphere of the chilliest indifference, by the way in which they represent the motive of sexual love. This feeling of indifference is due to the association in the drama of ardent passion with the most utter contingency, the whole interest being made to depend simply upon merely private persons. The event is, doubtless, of the very last importance to these persons, but not in itself. Addition. Amongst nations where women are held in slight esteem, parents arrange the marriage of their children, without ever consulting them. The children submit, because the particularity of feeling as yet makes no claim at all. The maiden is simply to have a husband, the man a wife. In other circumstances regard may be had to means, connections, political hopes. To make marriage the means for other ends may cause great hardship. But in modern times the subjective point of departure, i.e., being in love, is thought to be the only thing of consequence. In this it is taken for granted that each one must wait till his hour has struck, and that he can bestow his love upon one and only one individual.

163. The ethical side of marriage consists in the consciousness that the union is a substantive end. Marriage thus rests upon love, confidence, and the socializing of the whole individual existence. In this social disposition and reality natural impulse is reduced to the mode of a merely natural element, which is extinguished in the moment of its satisfaction. On the other hand, the spiritual bond of union, when its right as a substantive fact is recognized, is raised above the chances of passion and of temporary particular inclination, and is of itself indissoluble. Note. It has already been remarked that there is no contract in connection with the essential character of marriage (§75). Marriage leaves behind and transcends the standpoint of contract, occupied by the person who is sufficient for himself. Substance is such as to be in essential relation to its accidents.10 The union of personalities, whereby the family becomes one person, and its members its accidents, is the ethical spirit. The ethical spirit, stripped of the many external phases which it has in particular individuals and transitory interests, has been by picture-thought given independent form, and reverenced as the Penates, etc. In this attitude of mind is found that religious side of marriage and the family, which is called piety. It is a further abstraction, when the divine and substantive reality is separated from its physical embodiment. The result of this procedure is that feeling and the consciousness of spiritual unity become what is falsely called Platonic love. This separation is in keeping with the monastic doctrine, in which natural vitality is regarded as negative, and is given by this very separation an infinite importance. Addition. Marriage is distinguished from concubinage, since in concubinage the chief factor is the satisfaction of natural impulse, while in marriage this satisfaction is subordinate. Hence, in marriage one speaks without blushing of occurrences, which apart from the marriage relation cause a sense of shame. Therefore, also, is marriage to be esteemed as in itself indissoluble. The end of marriage is ethical, and

therefore occupies so high a place that everything opposing it seems secondary and powerless. Marriage shall not be liable to dissolution through passion, since passion is subject to it. But, after all, it is only in itself indissoluble, for, as Christ says, divorce is permitted, but only because of hardness of heart. Marriage, since it contains feeling, is not absolute, but open to fluctuations, and has in it the possibility of dissolution. Yet the laws must make the possibility as difficult as can be, and must retain intact the right of the ethical against inclination.

164. Just as in the case of contract it is the explicit stipulation, which constitutes the true transference of property (§79), so in the case of the ethical bond of marriage the public celebration of consent, and the corresponding recognition and acceptance of it by the family and the community, constitute its consummation and reality. The function of the church is a separate feature, which is not to be considered here. Thus the union is established and completed ethically, only when preceded by social ceremony, the symbol of language being the most spiritual embodiment of the spiritual (§78). The sensual element pertaining to the natural life has place in the ethical relation only as an after result and accident belonging to the external reality of the ethical union. The union can be expressed fully only in mutual love and assistance. Note. When the question as to the chief end of marriage is asked with a view to enact or recast laws, it means: Which particular side of the reality of marriage must be accepted as the most essential? But no one separate phase of marriage comprises the whole range of its absolute ethical content; and one or other phase of its existence may be wanting without injury to its essence. In the celebration of marriage the essence of the union is clearly understood to be an ethical principle, freed from the accidents of feeling and private inclination. If the solemnization be taken for an external formality, or a so-called mere civil requisition, the act loses all purpose except that of edification, or of an

attestation to the civic regulation. Indeed, there may perhaps remain only the positive arbitrariness of a civil or ecclesiastical command. Now, not only is a command of this kind indifferent to the nature of marriage, but in so far as the two persons have because of it ascribed value to the formality, and counted it as a condition precedent to complete abandonment to each other, it is an alien thing, bringing discord into the disposition of love, and thwarting the inner nature of the union. The opinion that the marriage ceremony is a mere civic mandate professes to contain the loftiest conception of the freedom, intensity, and completeness of love; but in point of fact it denies the ethical side of it, which implies a limitation and repression of the mere natural tendency. Reserve is already found naturally in a sense of shame, and is by the more articulate spiritual consciousness raised to the higher form of modesty and chastity. In a word, the view of marriage just criticised rejects the ethical side, by virtue of which consciousness gathers itself out of its native and subjective condition, and attains to the thought of the substantive. Instead of always holding before itself the accidental character of sensual inclination, it casts off the fetters of this state and engages itself to what is substantive and binding, namely, the Penates. The sensual [element is reduced and conditioned by the recognition of marriage as an ethical bond. Insolent is the view of the mere understanding, which is unable to apprehend marriage in its speculative nature. This substantive relation, however, is in harmony with the unsophisticated ethical sense, and with the laws of Christian nations. Addition. It is laid down by Friedrich v. Schlegel, in "Lucinde," and by a follower of his in the "Letters of an Unknown" (Lübeck and Leipzig, 1800), that the marriage-ceremony is a superfluous formality. They argue that by the form of marriage love, which is the substantive factor, loses its value; they represent that the abandonment to the sensual is necessary as proof of the freedom and inner reality of love. This style of argument is usual with

seducers. Besides, as regards the relation of man to woman, it is woman who, in yielding to sense, gives up her dignity, whereas man has another field than the family for his ethical activity. The sphere of woman is essentially marriage. Her rightful claim is that love should assume the form of marriage, and that the different elements existing in love should be brought into a truly rational connection.

165. The natural office of the sexes receives, when rationalized, intellectual and social significance. This significance is determined by the distinction which the ethical substance, as conception, introduces by its own motion into itself, in order to win out of the distinction its own life or concrete unity.

166. In one sex the spiritual divides itself into two phases, independent, personal self- sufficiency, and knowing and willing of free universality. These two together are the self- consciousness of the conceiving thought, and the willing of the objective final cause. In the other sex the spiritual maintains itself in unity and concord. This sex knows and wills the substantive in the form of concrete individuality and feeling. In relation to what is without one sex exhibits power and mastery, while the other is subjective and passive. Hence the husband has his real essential life in the state, the sciences, and the like, in battle and in struggle with the outer world and with him. self. Only by effort does he, out of this disruption of himself, reach self-sufficing concord. A peaceful sense of this concord, and an ethical existence, which is intuitive and subjective, he finds in the family. In the family the wife has her full substantive place, and in the feeling of family piety realizes her ethical disposition. Note. Hence piety is in the "Antigone" of Sophocles most superbly presented as the law of the woman, the law of the nature, which realizes itself subjectively and intuitively, the law of an inner life, which has not yet attained complete realization, the law of the ancient gods, and of the under-world, the eternal law, of whose origin

no one knows, in opposition to the public law of the state. This opposition is in the highest sense ethical, and hence also tragic; it is individualized in the opposing natures of man and woman. Addition. Women can, of course, be educated, but their minds are not adapted to the higher sciences, philosophy, or certain of the arts. These demand a universal faculty. Women may have happy inspirations, taste, elegance, but they have not the ideal. The difference between man and woman is the same as that between animal and plant. The animal corresponds more closely to the character of the man, the plant to that of the woman. In woman there is a more peaceful unfolding of nature, a process, whose principle is the less clearly determined unity of feeling. If women were to control the government, the state would be in danger, for they do not act according to the dictates of universality, but are influenced by accidental inclinations and opinions. The education of woman goes on one hardly knows how, in the atmosphere of picture- thinking, as it were, more through life than through the acquisition of knowledge. Man attains his position only through stress of thought and much specialized effort.

167. Marriage in its essence is monogamy, because in this relation it is the personality, the directly exclusive individuality which subsides and resigns itself. The true inner side of marriage, the subjective form of the real substantive institution, issues only out of such a mutual renunciation of personality as is shared in by no one else. Personality acquires the right of being conscious of itself in another, only in so far as the other appears in this identity as a person or atomic individuality. Note. Marriage, or monogamy, rather, is one of the principles on which the ethical life of a community depends most absolutely. Hence the institution of marriage is represented as one of the features of the divine or heroic founding of the state.

168. Since marriage proceeds out of the free resignation by both sexes of that personality which is infinitely peculiar to themselves, it must not occur within the bounds of natural identity, which involves great intimacy and unlimited familiarity. Within such a circle individuals have no exclusive personality. Marriage must rather take place in families that are unconnected, and between persons who are distinct in their origin. Between persons related by blood, therefore, marriage is contrary to the conception of it. It is an ethical act done in freedom, and not controlled by direct natural conditions and their impulses. Marriage within these limits is likewise contrary to true natural feeling. Note. To regard marriage as grounded not on a right of nature but on natural sexual impulse, to view it as a capricious contract, to give such an external reason for monogamy as the number of men in relation to the number of women, and to give only vague feelings as cause sufficient to prohibit marriage between blood connections, all such theories are due to the current idea of a state of nature, and to the opinion that such a state possesses rights. They are, however, devoid of the conception of rationality and freedom. Addition. Consanguineous marriages find opposition, in the first instance, in the sense of shame. This feeling of hesitation is justified by the conception. What is already united cannot be first of all united by marriage. As to the relation of mere nature, it is known that amongst animals copulation within one stock produces weaker offspring. What is to be joined ought to be at first distinct and separate. The power of production, both of spirit and body, is greater, the deeper are the oppositions out of which it restores itself. Familiarity, intimacy, habituation due to the same course of action, ought not to occur previous to marriage, but should be found for the first time in the married state. Their appearance after marriage has richer results and a higher value, the more numerous have been the points of difference.

169. The family, as person, has its external reality in property. If it is to furnish a basis for the substantive personality of the family, it must take the form of means.

B. The Family Means.

170. IT IS not enough that the family has property, but, as a universal and lasting person, it needs a permanent and sure possession, or means. When property is treated abstractly, there occur at random the particular needs of the mere individual, and also the self-seeking of the appetites. These now take on an ethical aspect, and are changed into provision for a common interest. Note. In the wise sayings concerning the founding of states, the institution of a sure property makes its appearance in connection with the institution of marriage, or at least with the introduction of an orderly social life.' — When we come to the civic community, we shall see in what family competence consists, and how it is to be secured.

171. The husband is the head of the family, and when it, as a legal person, collides with other families, he is its representative. It is expected of him, further, to go out and earn its living, care for its needs, and administer the family means. This means is a common possession, to which each member has a common but not a special right. This general right and the husband's right to dispose of the property may conflict, because the ethical sentiment (§158), which in the family is still in its simplest form, is subject to chance and violence.

172. Marriage establishes a new family, which has its own independent footing as against the stems or houses from which it has proceeded. The connection of the new family with these stems is consanguinity, but the principle of the new family is ethical love. Thus, the individual's property is essentially allied to his marriage, and less intimately to his original stock or house. Note. A marriage-settlement, which imposes a limit to the common possession of goods by the wedded couple, or any other arrangement by

which the right of the wife is retained, is intended to be security against the dissolution of the marriage-tie by death or divorce. In such an event the different members of the family are by this arrangement apportioned their shares of the common possession. Addition. In many law codes the more extended range of the family circle is retained. It is looked upon as the real bond of union, while the tie of the single family is regarded as comparatively unimportant. Thus in the older Roman law the wife of the lax marriage is more closely allied to her relatives than to her husband and children. In feudal times, also, the necessity of preserving the splendor familiae led to reckoning under the family only its male members. Thus the whole family connection was the chief object of concern, and the newly-formed family was placed in the background. Notwithstanding this, every new family is more essential than the wider circle bounded by the tie of consanguinity. A married couple with their children form a nucleus of their own in opposition to the more extended household. Hence the financial status of individuals must be more vitally connected with marriage than with the wider family union.

C. Education of the Children and Dissolution of the Family.

173. THE UNITY of marriage which, as substantive, exists only as an inner harmony and sentiment, but, so far as it exists actually, is separated in the two married persons, becomes in the children a unity, which has actual independent existence, and is an independent object. This new object the parents love as an embodiment of their love. The presupposition of the direct presence of the two people as parents becomes, when taken on its merely natural side, a result. This process expands into an infinite series of generations, which beget and are presupposed. At this finite and natural standpoint the existence of the simple spirit of the Penates is represented as species or kind. Addition. Between husband and wife the relation of love is not yet objective. Though feeling is a substantive unity, it has as yet no footing in reality. This foothold parents attain only in their children, in whom the totality of their alliance is visibly embodied. In the child the mother loves her husband, and the father his wife. In the child both parents have their love before their eyes. Whereas in means the marriage tie exists only in an external object, in children it is present in a spiritual being, in whom the parents are loved, and whom they love.

174. Children have the right to be supported and educated out of the common family means. The right of parents to the service of their children, as service, is limited to and based upon family cares. The right of parents over the free choice of their children is just as clearly limited to correction and education. The purpose of chastisement is not mere justice; it has a subjective moral side, its object being to restrain a freedom, which is still bound to nature, and to instil the universal into the child's consciousness

and will. Addition. Man does not possess by instinct what he is to be, but must first of all acquire it. Upon this is based the child's right to be educated. As it is with children, so is it with nations under paternal government; the people are supplied with food out of storehouses, and are not looked upon as self-dependent or of age. The services required of children must bear upon their education and promote their good. To ignore this good would destroy the ethical element of the relation, and make the child a slave. A prominent feature in the education of children is correction, intended to break their self-will, and eradicate what is merely sensual and natural. One must not expect to succeed here simply with goodness, because the direct volition of children is moved by immediate suggestions and likings, not by reasons and ideas. If we give children reasons, we leave it open to them whether to act upon them or not. In this way everything depends upon their pleasure. In the fact that parents constitute the universal and essential is included the necessity of obedience on the part of children. When no care is taken to cherish in children the feeling of subordination, a feeling begotten in them by the longing to be big, they become forward and impertinent.

175. Children are potentially free, and life is the direct embodiment of this potential freedom. Hence they are not things, and cannot be said to belong to any one, their parents or others. But their freedom is as yet only potential. The education of children has with regard to family life a two-fold object. Its positive aim is to exalt the ethical nature of the child into a direct perception free from all opposition, and thus secure that state of mind, which forms the basis of ethical life. The child thus passes his earlier years in love, trust, and obedience. Its negative aim is to lift the child out of the natural simplicity, in which it at first is, into self dependence and free personality, and thus make it able to leave the natural unity of the family. Note. That the children of Roman parents were slaves is one of the facts

which most tarnishes the Roman law. This wounding of the ethical life in its most intimate quarter is an important element in forming an estimate of the world-historical character of the Romans, as well as of their tendency towards formal right. The necessity for the education of children is found in their inherent dissatisfaction with what they are, in their impulse to belong to the world of adults, whom they reverence as higher beings, and in the wish to become big. The sportive method of teaching gives to children what is childish under the idea that it is in itself valuable. It makes not only itself ridiculous, but also all that is serious. It is scorned by children themselves. Since it strives to represent children as complete in their very incompleteness, of which they themselves are already sensible. Hoping to make them satisfied with their imperfect condition, it disturbs and taints their own truer and higher aspiration. The result is indifference to and want of interest in the substantive relations of the spiritual world, contempt of men, since they have posed before children in a childish and contemptible way, and vain conceit devoted to the contemplation of its own excellence. Addition. Man, as child, must have been included with his parents in the circle of love and mutual confidence, and the rational must appear in him as his own most private subjectivity. At the outset the education given by the mother is of greater importance, since social character must be planted in the child as feeling. It is noticeable that children as a rule love their parents less than the parents do their children. Children are on the way to meet independence and wax in strength; besides they have their parents in a sense behind them: but parents possess in their children the objective embodiment of their union.

176. Marriage is only the direct form of the ethical idea, and has its objective reality in the inwardness of subjective sentiment and feeling. In this is found its first exposure to accident. Just as no one may be forced to marry, so there must be no positive legal bond to hold together persons,

between whom have arisen hostile thoughts and acts. A third authority must, however, intervene to hold intact the right of marriage and the right of the ethical fabric against the inroads of mere opinion, and the accidents of fleeting resolves. It must also distinguish between the effervescence of feeling and total alienation, and have proof of alienation before permitting divorce. Addition. As marriage rests only upon a subjective sentiment which is liable to change, it may be dissolved. The state, on the contrary, is not subject to division, since it rests upon the law. Marriage should be indissoluble, but this desirable state of things remains a mere moral command. Yet, since marriage is ethical, it cannot be dissolved at random, but only by a constituted ethical authority, be it the church or the law. If total alienation has taken place on account of adultery, for example, then the religious authority also must sanction divorce.

177. The ethical or social dismemberment of the family occurs when the children have grown to be free personalities. They are recognized as legal persons, when they have attained their majority. They are then capable both of possessing free property of their own and of founding their own families, sons as heads of the family, and daughters as wives. In the new family the founders have now their substantive office, in contrast with which the first family must occupy a subordinate place as mere basis and point of departure. The family stock is an abstraction which has no rights.

178. The natural disruption of the family by the death of the parents, especially of the husband, necessitates inheritance of the family means. Inheritance is the entering into peculiar possession of the store that is in itself common. The terms of inheritance depend on degree of relation and on the extent of the dispersion throughout the community of the individuals and families, who have broken away from the original family and become independent. Hence inheritance is indefinite in proportion to the loss of the sense of unity, since every marriage is the renunciation of former

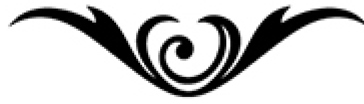
connections, and the founding of a new independent family. Note. It has been supposed that on the occasion of a death a fortune loses its owner, and falls to him who first gets possession of it. Actual possession, however, so the supposition runs, is generally made by relatives, since they are usually in the immediate neighbourhood of the deceased. Hence what customarily happens, is, for the sake of order, raised by positive law into a rule. This theory is little more than a whim, and altogether overlooks the nature of the family relation.

179. Through the dismemberment of the family by death there is afforded free scope for the capricious fancy of the testator, who may bestow his means in accordance with his personal likings, opinions, and ends. He may leave his possessions to friends and acquaintances instead of to the family, adopting the legal mode of bequest by embodying his declaration in a will. Note. Into the formation of a circle of friends by a bequest, which is authorized by ethical observance, there enters, especially in the case of wills, so much of arbitrariness, wilfulness, and selfishness, that the ethical element becomes extremely shadowy. Indeed the legal permission to be arbitrary in drawing up a will is rather the cause of injury to ethical institutions and, also, of underhand exertions and servility. It occasions and justifies the absurd and even malign desire to link to so-called benefactions and bequests of property, which in any case ceases at death to be mine, conditions that are vain and vexatious.

180. The principle that the members of a family become independent legal persons (§177) allows something of capricious discrimination with regard to the natural heirs to enter inside even the family circle. But this discrimination is greatly limited in order not to injure the fundamental relation of the family. Note. The simple direct freedom of choice of the deceased cannot be construed as the principle at the basis of the right to make a will. More particularly is this the case, if this wilfulness is opposed

to the substantive right of the family, whose love and esteem for the deceased would be the chief reason for carrying out after his death his wayward behest. Such a will contains nothing so worthy of respect as the family right. Formerly the validity of a last will and testament lay only in its arbitrary recognition of others. This validity can be conceded to a testamentary disposition only when the family relation, in which it would otherwise be absorbed, is weak and ineffective. But to ignore the province of the family relation, when it is real and present, is unethical; and it would also weaken its inherent ethical value to extend the boundaries of a testator's caprice. The harsh and unethical Roman law makes unlimited caprice inside the family the chief principle of succession, In accordance with this law the son could be sold by the father, and would, if freed, again come under his father's power. Only after being freed from slavery the third time, was he really free. According to these laws the son did not de jure come of age, and was not a legal person. Only what he took in war, peculium castrense, was he entitled to possess. When he, on being three times sold and freed, passed out of his father's power, he did not inherit along with those, who had remained in family servitude, except by the insertion of a special clause in the will. Similarly, the wife, in so far as she had entered marriage not as a slave, in manum conveniret, in mancipio esset, but as a matron, did not so much belong to the family, which had by her marriage been established, and was actually hers, as to the family of her birth. Hence she was excluded from inheriting wealth, which belonged to what was really her own family. Though wife and mother she was disinherited. It has already been observed (§3, note) that, as the feeling of rationality developed, efforts were made to escape from the unethical elements of these and other laws. The expression bonorum possessio, which, as every learned jurist knows, is to be distinguished from possessio bonorum, was drawn into service by the judges instead of hereditas, through

the employment of a legal fiction, by means of which a filia was changed by a second baptism into a filius. It thus sometimes became the sad necessity of the judges slyly to smuggle in the reasonable as an offset to bad laws. Hence, the most important institutions became pitifully unstable, and evils arose, which necessitated in turn a tumultuous mass of counter legislation. The unethical results, flowing from the right of free choice allowed by Roman law to testators, are well known from history and from the descriptions of Lucian and others. As to marriage it is a direct and simple ethical relation, and implies a mingling of what is substantive with natural contingency and inner caprice. By making children slaves, and by kindred regulations, conspicuously by ready and easy divorce, preference is openly conceded to wilfulness over the right of the substantive ethical fact. Thus Cicero himself, who, in his "Officiis" and other works has written many a fine thing about the Honestum and Decorum, devised the scheme of sending away his wife in order that he might with a second wife get a sufficient dowry to pay his debts. When such things occur, a way is paved by the law for the ruin of morals; or rather the laws are the necessary product of this ruin and decay. The institution of heirs-at-law is introduced in order to preserve the glory of the family stock. It makes use of substitutions and family trusts by excluding from the inheritance the daughters in favour of the sons, or the rest of the family in favour of the eldest son, or by sanctioning some other inequality. By it injustice is done to the principle of freedom of property (§62). Besides, it rests upon an arbitrary will, which has absolutely no right to be recognized, since it aims to preserve a particular stock or house rather than a particular family. But the family, and not the stock or house is the idea, which has the right to be preserved. Moreover, the ethical fabric is as likely to be maintained by the free disposal of property and equality of succession, as family trees are to be preserved by an opposite course. In institutions like the Roman the right



of marriage (§172) is everywhere misinterpreted. Marriage is the complete founding of a new and actual family, in contrast with which the family, as the stirps or gens is called, is an abstraction, becoming, as the generations pass by, ever more shadowy and unreal (§177). Love, the ethical element in marriage, is a feeling for real present individuals, and not for an abstraction. It is shown further on (§356) that the world-historical principle of the Roman empire is an abstraction of the understanding. It is also shown further on (§306) that the higher political sphere introduces a right of primogeniture and an inalienable family fortune, based, however, not on an arbitrary act of will, but on the necessary idea of the state. Addition. Amongst the Romans in earlier times a father could disinherit his children, and even put them to death. Afterwards neither of these acts was allowed. Efforts were made to bring both the unethical and also the illogical attempt to make it ethical into one system, the retention of which constitutes the difficulty and weakness of our law of inheritance. Wills may certainly be permitted, but in them should prevail the idea that the right of arbitrary decision grows only with the dispersion and separation of the members of the family. The so-called family of friendship, which bequest brings into existence, should appear only when there are no children or near relatives. Something offensive and disagreeable is associated with testamentary dispositions generally. In them I reveal those to whom I have inclination. But inclination is arbitrary, can be obtained surreptitiously, and is allied to whim and fancy. It may even be required in a will that an heir shall subject himself to the greatest indignities. In England, where they are given to riding all sorts of hobbies, an infinite number of absurdities are attached to wills.

Transition of the Family into the Civic Community.

181. In a natural way and essentially through the principle of personality, the family separates into a number of families, which then exist as independent concrete persons, and are therefore related externally to one another. The elements bound up in the unity of the family, which is the social idea still in the form of the conception, must now be released from the conception and given independent reality. This is the stage of difference. Here, at the outset, to use abstract expressions, we have the determination of particularity, which is nevertheless in relation to universality. The universal is, in fact, the basis, which is, however, as yet only internal, and therefore exists in the particular only formally, and in it is manifested externally. Hence in this relation occasioned by reflection the ethical is, as it were, lost; or rather since it, as essence, of necessity appears or is manifested, it occurs in its phenomenal form. This is the civic community. Note. The extension of the family or the transition of it into another principle has in the actual world two phases. It is on one side the peaceful expansion of the family into a people or nation, whose component parts have a common natural origin. On the other side it is the collection of scattered groups of families by superior force, or it is their voluntary association, in order to satisfy by co-operation their common wants. Addition. Universality has here a point of outlet in the independence of particularity. At this point the ethical appears to be lost. Consciousness finds in the identity of the family what is properly its first divine and obligatory principle. But now there appears a relation, in which the particular is to be the prime factor in determining my conduct. Thus the ethical seems to be discarded and superseded. But in this view I am really in error, for, while I believe myself to be retaining the particular, the universal and also the necessity of social unity still remain for me fundamental and essential. Besides, I am at the stage of appearance, and although my

particular nature remains for me the determining factor and end, I serve in this way the universal, which does not relax its own special hold of me.

Second Section: The Civic Community.

182. THE CONCRETE person, who as particular is an end to himself, is a totality of wants and a mixture of necessity and caprice. As such he is one of the principles of the civic community. But the particular person is essentially connected with others. Hence each establishes and satisfies himself by means of others, and so must call in the assistance of the form of universality. This universality is the other principle of the civic community. Addition. The civic community is the realm of difference, intermediate between the family and the state, although its construction followed in point of time the construction of the state. It, as the difference, must presuppose the state. On the self-dependent state it must rely for its subsistence. Further, the creation of the civic community belongs to the modern world which alone has permitted every element of the idea to receive its due. When the state is represented as a union of different persons, that is, a unity which is merely a community, it is only the civic community which is meant. Many modern teachers of political science have not been able to develop any other view of the state. In this society every one is an end to himself; all others are for him nothing. And yet without coming into relation with others he cannot realize his ends. Hence to each particular person others are a means to the attainment of his end. But the particular purpose gives itself through reference to others the form of universality, and in satisfying itself accomplishes at the same time the well-being of others. Since particularity is bound up with the conditioning universal, the joint whole is the ground of adjustment or mediation, upon which all individualities, all talents, all accidents of birth or fortune disport themselves. Here the fountains of all the passions are let loose, being

merely governed by the sun of reason. Particularity limited by universality is the only standard to which the particular person conforms in promoting his well-being.

183. The self-seeking end is conditioned in its realization by the universal. Hence is formed a system of mutual dependence, a system which interweaves the subsistence, happiness, and rights of the individual with the subsistence, happiness, and right of all. The general right and well- being form the basis of the individual's right and wellbeing, which only by this connection receives actuality and security. This system we may in the first instance call the external state, the state which satisfies one's needs, and meets the requirements of the understanding.

184. When the idea is thus at variance with itself, it imparts to the phases of the peculiarly individual life, i.e., to particularity, the right to develop and publish themselves on all sides, and to universality it concedes the right to evince itself as the foundation and necessary form, overruling power and final end of the particular. In this system the ethical order is lost in its own extremes. It is a system characterized by external appearance and constituted by the abstract side of the reality of the idea. In it the idea is found only as relative totality, and inner necessity. Addition. The direct unity of the family is here broken up into a multiplicity, and the ethical is lost in its extremes. Reality is at this stage externality, involving the dissolution of the conception, the liberation and independence of its realized elements. Although in the civic community particular and universal fall apart, they are none the less mutually connected and conditioned. While the one seems to be just the opposite of the other, and is supposed to be able to exist only by keeping the other at arm's length, each nevertheless has the other as a condition. Thus most people, for example, regard the payment of taxes as injuring their particularity, and as opposing and crippling their plans. True as this may seem to be, the particular purpose cannot be carried

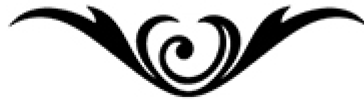
out apart from the universal. A land, in which no taxes were paid, would not be allowed to distinguish itself for the strength of its individuals. In the same way it might appear as if it would be better for the universal to draw to itself the resources of the individual, and become a society such as was delineated by Plato in his "Republic." But this, too, is only a mere appearance, since both elements exist only through and for each other, and are wrapped up in each other. When I promote my end, I promote the universal, and the universal in turn promotes my end.

185. When independent particularity gives free rein to the satisfaction of want, caprice, and subjective liking, it destroys in its extravagance both itself and its substantive conception. On the other hand the satisfaction whether of necessary or of contingent want is contingent, since it contains no inherent limit, and is wholly dependent on external chance, caprice, and the power of the universal. In these conflicts and complexities the civic community affords a spectacle of excess, misery, and physical and social corruption. Note. The independent development of particularity (compare §124, note), is the element which was revealed in the ancient states as an inflow of immorality causing ultimately their decay. These states, founded as they were partly upon a patriarchal and religious principle, partly upon a spiritual though simple ethical life, and originating in general in native intuitions, could not withstand the disunion and infinite reflection involved in self-consciousness. Hence, so soon as reflection arose, the state succumbed, first in sentiment and then in fact. Its as yet simple principle lacked the truly infinite power implied in a unity, which permits the opposition to reason to explode with all its force. In this way it would rise superior to the opposition, preserve itself in it, and take it into itself. Plato in his "Republic" represents the substantive ethical life in its ideal beauty and truth. But with the principle of independent particularity, which broke in upon Greek ethical life at his time, he could do nothing except to oppose to

it his “Republic,” which is simply substantive. Hence he excluded even the earliest form of subjectivity, as it exists in private property (§46, note) and the family, and also in its more expanded form as private liberty and choice of profession. It is this defect, which prevents the large and substantive truth of the “Republic” from being understood, and gives rise to the generally accepted view that it is a mere dream of abstract thought, or what we are used to calling an ideal. In the merely substantive form of the actual spirit, as it appears in Plato, the principle of self-dependent and in itself infinite personality of the individual, the principle of subjective freedom does not receive its due. This principle on its inner side issues in the Christian religion, and on its outer side in the Roman world, where it was combined with abstract universality. It is historically later than the Greek world. So, too, the philosophic reflection, which fathoms the depth of this principle, is later than the substantive idea found in Greek thought. Addition. Particularity, taken abstractly, is measureless in its excess, and the forms of excess are likewise measureless. A man’s appetites, which are not a closed circle like the instinct of the animal, are widened by picture-thought and reflection. He may carry appetite even to the spurious infinite. But on the other side privation and want are also measureless. The confusion, due to the collision of appetite and privation, can only be set to rights by the state. If the Platonic state excludes particularity, no hope can be held out to it, as it contradicts the infinite right of the idea to allow to particularity its freedom. In the Christian religion, the right of subjects and also the existence, which is self-referring and self-dependent, have received a marked expansion. And at the same time the whole is sufficiently strong to establish harmony between particularity and the ethical unity.

186. But the principle of particularity develops of its own accord into a totality, and thus goes over into universality. In this universality it has its truth and its right to positive realization. Since at the standpoint of dualism,

which we now occupy (§184), the principles of particularity and universality are independent, their unity is not an ethical identity. It does not exist as freedom, but as a necessity. That is to say the particular has to raise itself to the form of universality, and in it it has to seek and find its subsistence.



187. Individuals in the civic community are private persons, who pursue their own interests. As these interests are occasioned by the universal, which appears as a means, they can be obtained only in so far as individuals in their desire, will, and conduct, conform to the universal, and become a link in the chain of the whole. The interest of the idea as such does not, it is true, lie in the consciousness of the citizens; yet it is not wholly wanting. It is found in the process, by means of which the individual, through necessity of nature and the caprice of his wants, seeks to raise his individual natural existence into formal freedom and the formal universality of knowing and willing. Thus, without departing from its particular nature, the individual's character is enlarged. Note. The view that civilization is an external and degenerate form of life is allied to the idea that the natural condition of uncivilized peoples is one of unsophisticated innocence. So also the view that civilization is a mere means for the satisfaction of one's needs, and for the enjoyment and comfort of one's particular life, takes for granted that these selfish ends are absolute. Both theories manifest ignorance of the nature of spirit and the end of reason. Spirit is real only when by its own motion it divides itself, gives itself limit and finitude in the natural needs and the region of external necessity, and then, by moulding and shaping itself in them, overcomes them, and secures for itself an objective embodiment. The rational end, therefore, is neither the simplicity of nature nor the enjoyments resulting from civilization through the development of particularity. It rather works away from the condition of simple nature, in which there is either no self or a crude state of consciousness and will, and

transcends the naive individuality, in which spirit is submerged. Its externality thus in the first instance receives the rationality, of which it is capable, namely, the form of universality characteristic of the understanding. Only in this way is spirit at home and with itself in this externality as such. Hence in it the freedom of spirit is realized. Spirit, becoming actualized in an element, which of itself was foreign to its free character, has to do only with what is produced by itself and bears its own impress. In this way the form of universality comes into independent existence in thought, a form which is the only worthy element for the existence of the idea. Culture or education is, as we may thus conclude, in its ultimate sense a liberation, and that of a high kind. Its task is to make possible the infinitely subjective substantiality of the ethical life. In the process we pass upwards from the direct and natural existence to what is spiritual and has the form of the universal. In the individual agent this liberation involves a struggle against mere subjectivity, immediate desire, subjective vanity, and capricious liking. The hardness of the task is in part the cause of the disfavour under which it falls. None the less is it through the labour of education that the subjective will itself wins possession of the objectivity, in which alone it is able and worthy to be the embodiment of the idea. At the same time the form of universality, into which particularity has moulded itself and worked itself up, gives rise to that general principle of the understanding, in accordance with which the particular passes upward into the true, independent existence of the individual. And since the particular gives to the universal its adequate content and unconditioned self-direction, it even in the ethical sphere is infinitely independent and free subjectivity. Education is thus proved to be an inherent element of the absolute, and is shown to have infinite value. Addition. We call those men educated or cultured, who can perform all that others do without exhibiting any oddities of behaviour. Uneducated men thrust their eccentricities upon

your notice, and do not act according to the universal qualities of the object. It easily happens that the uneducated man wounds the feelings of others, since he lets himself go, and does not trouble himself about their sensibilities. Not that he desires to injure them at all, but his conduct is not in unison with his will. Education refines particularity, and enables it to conduct itself in harmony with the nature of the object. True originality, which creates its object, desires true culture, while untrue originality adopts insipidities, which are characteristic of a lack of culture.

188. The civic community contains three elements: A. The recasting of want, and the satisfaction of the individual through his work, through the work of all others, and through the satisfaction of their wants. This is a system of wants. B. Actualization of the general freedom required for this, i.e., the protection of property by the administration of justice. C. Provision against possible mischances, and care for the particular interest as a common interest, by means of police and the corporation.

A. The System of Wants.

189. THE PARTICULARITY, which is in the first instance opposed to the universal will (§60), is subjective want. It gets objectivity, i.e., is satisfied (a), through external objects, which are at this stage the property of others, and the product of their needs and wills, and (b) through active labour, as connecting link between subjective and objective. Labour has as its aim to satisfy subjective particularity. Yet by the introduction of the needs and free choice of others universality is realized. Hence rationality comes as an appearance into the sphere of the finite. This partial presence of rationality is the understanding, to which is assigned the function of reconciling the opposing elements of the finite sphere. Note. It is the task of political science, which originates at this point, to detect the laws governing the movement of the masses in the intricacy of their qualitative and quantitative relations. This science has sprung from the soil of modern times. Its development reveals the interesting process by which thought (see Smith, Say, Ricardo) examines the infinite multitude of particulars lying before it, and exposes their simple, active, regulating principles. These principles belong to the understanding. As on the one side the principle of reconciliation involves a recognition of the external presence or appearance in the sphere of want of the reason which is active in the object; so, on the exact contrary, is this also the sphere in which the understanding with its subjective aims and moral opinions lets loose its discontent and moral vexation. Addition. It depends altogether on accident how such universal wants, as those of food, drink, and clothing, are to be satisfied. The soil is more fertile in one place than another; years differ in their yield; one man is diligent, while another is lazy. But this swarm of arbitrary things begets

universal features, and what appears to be pure abstraction and absence of thought becomes bound by a necessity, which enters of itself. To discover the element of necessity is the object of political science, a science which does honour to thought, because it finds laws in a mass of accidents. Interesting is it to witness the action and reaction of the different relations, how the special circles group themselves, influence others, and in turn receive from them, help or hindrance. So remarkable is this interpretation of facts in a sphere, where everything seems to be postponed to the free will of the individual, that it almost passes belief. It resembles the planets, which though to the eye always complex and irregular in their movements, are yet governed by ascertained laws. (a) Want and its Satisfaction.

190. The animal has a limited range of ways and means for satisfying his limited wants. Man in his dependence proves his universality and his ability to become independent, firstly, by multiplying his wants and means, and, secondly, by dissecting the concrete want into parts. The parts then become other wants, and through being specialized are more abstract than the first. Note. The object is in right a person, in morals a subject, in the family a member, in the city generally a burgher (bourgeois); and here, at the standpoint of want (§123, note), he is the concrete product of picture-thought which we call man. Here, and properly only here, is it that we first speak of man in this sense. Addition. The animal is particular in its being, having instinct, and a strictly limited means of satisfaction. Some insects are confined to a certain kind of plant; other animals have a wider circle and can inhabit different climates, but still their range is limited in contrast with that of man. Man's need of shelter and clothing, his having to destroy the natural form of food, and adapt it by cooking to his changed taste, give him less aplomb than the animal. Indeed, as spirit, he ought to have less. The understanding, with its grasp of differences, brings multiplicity into wants: and, when taste and utility become criteria of judgment, they change even

the wants themselves. It is in the end not the appetite, but the opinion which has to be satisfied. It is the province of education or culture to dissect the concrete need into its elements. When wants are multiplied, the mere appetites are restricted; for, when man uses many things, the propulsion to any one of them is not so strong, a sign that the force of physical need in general is diminished.

191. The means for satisfying the specialized wants are similarly divided and increased. These means become in their turn relative ends and abstract wants. Hence the multiplication expands into an infinite series of distinctions with regard to these phases, and of judgments concerning the suitability of the means to their ends. This is refinement. Addition. What the English call "comfortable" is something endless and inexhaustible. Every condition of comfort reveals in turn its discomfort, and these discoveries go on for ever. Hence the new want is not so much a want of those who have it directly, but is created by those who hope to make profit from it.

192. The satisfaction of want and the attainment of means thereto become a realized possibility for others, through whose wants and labour satisfaction is in turn conditioned. The abstraction, which becomes a quality of wants and means (§191), helps to determine the mutual relation of individuals. This general recognition of others is the element which makes the isolated abstract wants and means concrete and social. Addition. Through the compulsion I am under to fashion myself according to others arises the form of universality. I acquire from others the means of satisfaction, and must accordingly fall in with their opinions. At the same time I am compelled to produce the means for the satisfaction of the wants of others. One plays into the other; and the two are interdependent. Everything particular becomes in this way social. In the matter of dress, time of eating, etc., we follow convention, because it is not worth while

exercising our insight and judgment. He is the most prudent who does as others do.

193. The social element is a special instrument both of the simple acquisition of the means, and also of the reduplication of the ways by which want is satisfied. Further, it contains directly the claim of equality with others. Both the desire for equality, including the imitation of others, and also the desire of each person to be unique, become real sources of the multiplication and extension of wants.

194. Social want joins the direct or natural want with the spiritual want due to picture-thinking; but the spiritual or universal factor outweighs the other. The social element brings a liberation, by which the stringent necessity of nature is turned aside, and man is determined by his own universal opinion. He makes his own necessity. He has arbitrary choice, being in contact with a contingency which is not external but internal. Note. It has been held that man as to want is free in a so-called state of nature, in which he has only the so-called simple wants of nature, requiring for their satisfaction merely the means furnished directly and at random by nature. In this view no account is taken of the freedom which lies in work, of which more hereafter. Such a view is not true, because in natural want and its direct satisfaction the spiritual is submerged by mere nature. Hence, a state of nature is a state of savagery and slavery. Freedom is nowhere to be found except in the return of spirit and thought to itself, a process by which it distinguishes itself from the natural and turns back upon it.

195. This liberation is formal, since the particular side of the end remains the fundamental content. The tendency of the social condition indefinitely to increase and specialize wants, means, and enjoyments, and to distinguish natural from unrefined wants, has no limits. Hence arises luxury, in which the augmentation of dependence and distress is in its nature infinite. It operates upon an infinitely unyielding material, namely, an external means,

which has the special quality of being the possession of the free will. Hence it meets with the most obdurate resistance. Addition. Diogenes in his completely cynical character is properly only a product of Athenian social life. That which gave birth to him was the public opinion, against which his behaviour was directed. His way of therefore not independent, but occasioned by his social surroundings. It was itself an ungainly product of luxury. Wherever luxury is extreme, there also prevail distress and depravity, and cynicism is produced in opposition to over-refinement. (b) Labour.

196. The instrument for preparing and acquiring specialized means adequate to specialized wants is labour. By labour the material, directly handed over by nature for these numerous ends, is specialized in a variety of ways. This fashioning of the material gives to the means value and purpose, so that in consumption it is chiefly human products and human effort that are used up. Addition. The direct material, which requires no working up, is small. Even air must be acquired, since it has to be made warm. Perhaps water is the only thing which man can use, simply as it is. Human sweat and toil win for men the means for satisfying their wants.

197. Training on its theoretical side is developed by the great variety of objects and interests, and consists not only in numberless picture thoughts and items of knowledge, but also in mobility and quickness of imagination, a mental alertness in passing from one image, or idea, to another, and in the apprehension of intricate general relations. This is the training of the understanding, with which goes the development of language. Practical training, or training by labour, consists in habituation to an employment, which satisfies a self-caused want. Its action is limited partly by the nature of the material, but chiefly by the caprice of others. It involves an habitual use of skill acquired by practice and implying objective conditions. Addition. -The barbarian is lazy, and is distinguished from the civilized man

by his brooding stupidity. Practical training consists in habitual employment and the need of of it. The unskilled workman always makes something different from what he intended, because he is not master of his own hands. A workman is skilled, who produces what he intended, whose subjective action readily accords with his purpose.

198. The universal and objective in work is to be found in the abstraction which, giving rise to the specialization of means and wants, causes the specialization also of production. This is the division of labour. By it the labour of the individual becomes more simple, his skill in his abstract work greater, and the amount he produces larger. The result of the abstraction of skill and means is that men's interdependence or mutual relation is completed. It becomes a thorough necessity. Moreover, the abstraction of production causes work to be continually more mechanical, until it is at last possible for man to step out and let the machine take his place.(c) Wealth.

199. Through the dependence and co-operation involved in labour, subjective self-seeking is converted into a contribution towards the satisfaction of the wants of all others. The universal so penetrates the particular by its dialectic movement, that the individual, while acquiring, producing, and enjoying for himself, at the same time produces and acquires for the enjoyment of others. This is a necessity, and in this necessity arising out of mutual dependence is contained the fact of a general and permanent wealth (§170). In it each person may share by means of his education and skill. Each, too, is by it assured of subsistence, while the results of his labour preserve and increase the general wealth.

200. But particular wealth, or the possibility of sharing in the general wealth, is based partly on skill, partly on something which is directly the individual's own, namely, capital. Skill in its turn depends on capital, and on many accidental circumstances. These also in their manifold variety make more pronounced the differences in the development of natural

endowments, physical and mental, which were unequal to begin with. These differences are conspicuous everywhere in the sphere of particularity. They, along with other elements of chance and accident, necessarily produce inequalities of wealth and skill. Note. Nature is the element of inequality. Yet the objective right of particularity of spirit, contained in the idea itself, does not in the civic community supersede the inequality set up by nature. On the contrary, it produces inequality out of spirit and exalts it to an inequality of talents, wealth, and intellectual and moral education. To oppose to the objective right a demand for equality is a move of the empty understanding, which takes its own abstraction and mandate to be real and reasonable. In the sphere of particularity the universal images itself, forming with the particular merely a relative identity. The particular thus retains both the natural and the capricious particularity, and also a remnant of the state of nature. It is the reason immanent in the system of human wants and their activities, which fashions this system into an organic whole, of which the differences are members. (See next §.)

201. The infinitely varied means and their infinitely interlacing play of mutual production and exchange are gathered together by virtue of the universality inherent in their content, and become divided into general masses. The whole is thus formed into particular systems of wants, means, and labour, ways and methods of satisfaction, and theoretical and practical training. Amongst these systems the individuals are apportioned, and compose a cluster of classes or estates. Addition. The manner of sharing in the general wealth is left to each particular individual, but the general differences, found in the division of the civic community, are essential. The family is the first basis of the state, and classes or estates are the second. This second is of consequence because private persons, through self-seeking, are compelled to turn themselves out towards others. This is the

link by which self-seeking is joined to the universal or the state, whose care it must be to keep the connection strong and steadfast.

202. Classes are, in terms of the conception, (a) the substantial or direct, (b) the reflecting or formal, and (c) the universal.

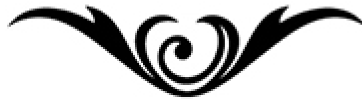
203. (a) The wealth of the substantial class is contained in natural products obtained by cultivation. The soil is capable of being an exclusive, private possession, and demands not merely the taking from it what it bears naturally, but an objective working up. Since the returns of labour depend on the seasons, and harvests are influenced by variable weather and other natural conditions, provision for wants must take account of the future. However, owing to the natural conditions, this way of life involves but little reflection, and is but slightly modified by subjective volition. It therefore embodies in substantive feeling an ethical life resting directly upon trust and the family relation. Note. States are rightly said to come into existence with the introduction of agriculture along with the introduction of marriage. The principle of agriculture involves the cultivation of the soil, and therefore, also, private ownership of property (compare §170, note). It takes the life of nomadic tribes back to the repose of private right and to the secure satisfaction of wants. Joined also to the agricultural life are the limitation of sexual love to marriage, the extension of this bond to an enduring universal relation, the extension of want to family maintenance and of possession to family wealth. Safety, protection by fortification, and uninterrupted satisfaction of wants are all commendable prima facie characteristics of these two fundamental ethical institutions. They are forms of universality, or ways by which reason or the absolute end seeks to realize itself. In this connection nothing can be more interesting than the ingenious and learned explanations which my much honoured friend, Mr. Creuzer, has given in the fourth volume of his “Mythologie und Symbolik” with regard to the agrarian festivals, images, and sanctuaries of the ancients. In these

customs and rites the introduction of agriculture and kindred institutions was known and revered as a divine act. From the side of private-right, especially the administration of justice, and from the side of instruction, culture, and also of religion, the substantive character of this class undergoes modifications. These modifications, however, are due to the development of reflection, and affect not the substantive content but the form. They occur also in the other classes. Addition. In our time agriculture, losing some of its naturalness, is managed in a reflective way like a factory, and acquires the character of the second class. Yet it will always retain much of the substantive feeling, which pervades the patriarchal life. In it man accepts what is given with a simple mind, thanks God for it, and lives in the assurance that the goodness of God will continue. What he gets suffices him, and he uses it because it comes again. This is the simple disposition unaffected by the desire for wealth. It may be described as the type of the old nobility, who consumed simply what was there. In this class nature does the chief share of the work, and man's diligence is in comparison secondary. In the second class the understanding is the essential factor, and the natural products are regarded simply as furnishing material.

204. (b) The business of the industrial class is to alter the form of the products of nature. This class is indebted for its subsistence to its labour, to reflection, and also to the interposition of the wants and labours of others. For that which it produces and enjoys it has to thank mainly its own activity. Its field of action is again divided into three parts: — (i.) Labour for individual wants of the more concrete kind, and at the request of particular persons. This is manual labour, or the work of single artisans, (ii.) The more abstract collective mass of labour, which is also for particular needs but due to a general demand. This is manufacture, (iii.) Business of exchange, by which one special means of subsistence is given for others, chiefly through money, the general medium of exchange, in which is

realized the abstract value of all merchandise. This is commerce. Addition. The individual in the industrial class is referred to himself, and this self-reference is intimately connected with the demand for a legal status. Consequently the sense for freedom and order has mainly arisen in cities. The first class needs to think little about itself. What it acquires is the gift of a stranger, nature. With it the feeling of dependence is primary. With this feeling is easily associated a willingness to submit to whatever occurs. The first class is therefore more inclined to subjection, the second to freedom. 205 (c) The business of the universal class is with the universal interests of society. Hence it must be relieved, of the direct task of providing for itself. It must possess private means, or receive an allowance from the state, which claims his activity. His private interest may thus find satisfaction in his labour for the universal.

206. A class is a particularity which has become objective, and the foregoing are the general divisions in accordance with the conception. Yet capacity, birth, and other circumstances have their influence in determining to what class an individual shall belong. But the final and essential factor in the case is subjective opinion and private freedom of choice. In this sphere free choice has its right, honour, and dignity. If a thing happens in this sphere according to internal necessity, it is ipso facto occasioned by free arbitrary choice, and for the subjective consciousness bears the stamp of its will. Note. In reference to the principle of particularity or subjective caprice may be clearly discerned the difference between the political life of the East and that of the West, between the ancient and the modern world. In the ancient world the division of the whole into classes was produced objectively of itself, because it is implicitly rational. But the principle of subjectivity does not receive its due, since the separation of individuals into classes is either a function of the rulers, as in Plato's "Republic" (Rep. iii. 120), or else it rests upon mere birth, as in the caste system of India. Now



subjective particularity is an essential element of communal life, and, when it is not taken up into the organization of the whole and reconciled in the whole, it must prove a hostile force and pave the way for the ruin of the social order (see §185, note). It either overturns society, as was the case in the Greek states and the Roman republic, or, when the existing order is able to preserve itself by force or by religious authority, it then manifests itself as internal corruption and complete degradation. This happened in a measure amongst the Lacedemonians, and now is completely the case with the inhabitants of India. But when subjective particularity is welcomed by objective order, and given its rights and place, it becomes the animating principle of the civic community, stimulates thought and promotes merit and honour. The recognition of the claim that whatever in the civic community and the state is rationally necessary should occur through subjective freechoice is a fuller definition of the popular idea of freedom (§121).

207. The particularity of the individual becomes definitely and actually realized, only by his limiting himself exclusively to one of the particular spheres of want. In this system the ethical sense is that of rectitude or class-honour. It involves the decision of the individual by means of his own native activity, diligence, and skill to make himself a member of one of these classes, preserve himself in it, and provide for himself only through the instrumentality of the universal. He should acknowledge this position, and also claim to have it recognized by others. Morality has its peculiar place in this sphere, where the ruling factor is reflection upon one's action, or consideration of the end involved in particular wants and in well-being. Here also the element of chance in satisfying these ends makes random and individual assistance a duty. Note. Youth is specially apt to struggle against the proposal that it should decide upon a particular vocation, on the ground that any decision is a limitation of its universal scope and a mere external

necessity. This aloofness is a product of the abstract thinking, which clings to the universal and unreal. It fails to recognize that the conception must experience a division into conception and its reality, if it is to have a definite and particular realization (§7), and to win for itself reality and ethical objectivity. Addition. By the sentence that a man must be something we understand that he must belong to a definite class; for this something signifies a substantive reality. A human being without a vocation is a mere private person, who has no place in any real universal. Still, the individual in his exclusiveness may regard himself as the universal, and may fancy that when he takes a trade or profession, he is sinking to a lower plane. That is the false notion that a thing, when it attains the realization which properly belongs to it, limits itself and gives up its independence.

208. The principle of the system of wants, namely the particularity of knowing and willing, contains absolute universality, or the universality of freedom, only in the abstract form of right of property. But here right is no longer merely implicit, but is found in valid reality as protection of property through the administration of justice.

B. Administration of Justice.

209. THE RELATIVE principle of the mutual exchange of wants and labour for their satisfaction has in the first instance its return into itself in the infinite personality generally, i.e., in abstract right. Yet it is the very sphere of the relative which in the form of education gives embodiment to right, by fixing it as something universally acknowledged, known, and willed. The relative also, through the interposition of knowledge and will, supplies right with validity and objective actuality. Note. It is the essence of education and of thought, which is the consciousness of the individual in universal form, that the I should be apprehended as a universal person, in whom all are identical. Man must be accounted a universal being, not because he is a Jew, Catholic, Protestant, German, or Italian, but because he is a man. This thinking or reflective consciousness, is of infinite importance. It is defective only when it plumes itself upon being cosmopolitan, in opposition to the concrete life of the citizen. Addition. From one point of view it is by means of the system of particularity that right becomes externally necessary as protection of individuals. Although right proceeds out of the conception, it enters into being only because it is serviceable for wants. To have the thought of right, one must be educated to the stage of thinking, and not linger in the region of the merely sensible. We must adapt the form of universality to the objects, and direct the will according to a universal principle. Only after man has found out for himself many wants, the acquisition of which is an inseparable element of his satisfaction, is he able to frame laws.

210. The objective actuality of right consists partly in existing for consciousness, or more generally in its being known, and partly in having,

and being generally recognized as having, the validity and force of a reality. (a) Right as Law.

211. What is in essence right becomes in its objective concrete existence constituted, [Gesetzt.] that is, made definite for consciousness through thought. It, having right and validity, is so recognized, and becomes law. [Gesetz.] Right in this characterization of it is positive right in general. Note. To constitute something as universal, i.e., to bring it as universal to consciousness, is to think (§13, note, and §21, note). The content in thus being brought back to its simplest form is given its final mould. Only when what is right becomes law does it receive not merely the form of universality, but its own truest character. It is to select only one phase of law, if we consider it merely as a valid rule of conduct imposed upon all. Preceding this feature is the internal and essential element of law, namely, the recognition of the content in its definite "universality. Even the rights of custom exist as thought and are known. Animals have law in the form of instinct; man alone has law in the form of custom. The difference between custom and law consists merely in this, that customs are known in a subjective and accidental way, and hence are in their actual form more indefinite than laws. In custom, the universality of thought is more obscured, and the knowledge of right is a partial and accidental possession of a few. The idea that customs rather than laws should pass over into life is a deception, because the valid laws of a nation, when written and collected, do not cease to be customs. People speak nowadays, indeed, most of all of life and of things passing over into life, when they are conversant with nothing but the deadest material and the deadest thoughts. When customs come to be collected and grouped, as takes place with every people which reaches a certain grade of civilization, there is formed a statute-book. It is somewhat different from a statute-book properly so-called. A collection is formless, indefinite, and fragmentary, whereas a real statute-book

apprehends and expresses in terms of thought the principles of law in their universality. England's land-law or common law is, as is well known, made up both of statutes, having the forms of laws, and of so-called unwritten laws. However, this unwritten law is written with a vengeance, and a knowledge of it is possible only by reading the many quartos which it fills. The monstrous confusion which prevails in that country, both in the administration of justice and in the subject-matter of the law, is graphically portrayed by those who are acquainted with the facts. They specially notice that, since the unwritten law is contained in the decisions of law-courts and judges, the judges are continually the lawgivers. Further, the judges are both directed and not directed to the authority of their predecessors. They are so directed, because their predecessors are said to have done nothing but interpret the unwritten law. They are not so directed, because they are supposed to have in themselves the unwritten law, and hence have a right to determine whether previous decisions are in keeping with it or not. To avoid a similar confusion, which would have arisen in the administration of justice at Rome, when in later times the views of all the celebrated lawyers were made authoritative, one of the emperors hit upon an ingenious expedient. He passed a law, by which was founded a kind of college consisting of the jurisconsults who were longest deceased. This body had a president, and came to decisions through a majority of votes (Mr. Hugo's "History of Roman Law," §354). It is the task of a nation, or at least of its jurisconsults, not indeed to make a system of laws entirely new in content, but to recognize the existing content of laws in its definite universality. They should apprehend it in thought, while also making additions with regard to its application to special cases. To refuse to a people or its lawyers this right would be a flagrant insult. Addition. The sun and the planets have laws, but they do not know them. Barbarians are ruled by impulses, customs, feelings, but have no consciousness of them. When right is

established as law and known, all random intuitions and opinions, revenge, compassion, and self-interest, fall away. Only then does right attain its true character and receive its due honour. In being apprehended right is purified from all mixture of chance elements, and thus becomes for the first time capable of universal application. Of course, in the administration of the laws collisions will necessarily occur, which must be settled by the understanding of the judge; otherwise, the execution of the law would be merely mechanical. But to do away with collisions by giving full scope to the judge's well-meant opinions would be the poorest solution of the difficulty. Collisions, in fact, belong to the nature of thought, the thinking consciousness and its dialectic, while the mere decision of a judge is arbitrary. In favour of rights of custom it is usually adduced that they are living; but life, consisting in simple identity with the subject, does not constitute the essence of the matter. Right must be known in thought. It must be a system in itself, and only as a system can it be valid for civilized peoples. Very recently the vocation of making laws has been abolished. This is not only an affront, but also implies the absurdity that to no individual has been given the capacity to systematize the infinite multitude of existing laws, and expose the universal contained in them, when this task is precisely the most pressing need of the day Similarly, it has been held that a digest of decisions, such as the Corpus juris, is preferable to a statute-book giving a detailed exhibition of the universal. A certain particularity and reminiscence of the historical is supposed to be contained in the decisions, and in a statute-book it is thought that these advantages would be wanting. But the mischievous nature of a mere collection is clearly manifest in the practice of the English law.

212. Through this identity of the abstract or implicit with what is actually constituted, [Gesetzt.] only that right is binding which has become law. [Gesetz.] But since to constitute a thing is to give it outer reality, there may

creep into the process a contingency due to self-will and other elements of particularity. Hence, the actual law may be different from what is in itself right. Note. Hence, in positive right that which is lawfully established is the source of the knowledge of what is right, or, more accurately, is the final resort in litigation. Positive jurisprudence is to that extent an historical science based on authority. Additions are a matter of the understanding, and concern outward arrangements, combinations, results, further applications, and the like. But when the understanding meddles with the essential substance of the matter, it may serve up singular theories, of which those regarding criminal law are an illustration. It is not only the right but the necessary duty of positive science, it is true, to deduce out of its positive data the historic progress and also applications and ramifications. Yet it cannot be wondered at if it be regarded as a fair cross-question whether a specific finding is after all wholly in accordance with reason (compare on this point §3 note).

213. Right is realized in the first instance in the form of constituted law. But it must in its content have further realization. It must apply to the matter of the relations bearing on property and contract, complicated and ramified as these relations in the civic community become. It must apply also to the ethical relations of feeling, love, and confidence, but only in so far as they contain the phase of abstract right (§159). The moral commands, touching the will in its most private subjectivity and particularity, cannot be the object of positive legislation. But additional material for legislation is furnished by the rights and duties which flow from the administration of justice itself and from the state. Addition. Of the higher relations of marriage, love, religion, and the state, only those aspects can be objects of legislation, which are by their nature capable of having an external embodiment. Here the laws of different nations are very different. Amongst the Chinese, for example, it is a law of the state that the husband shall love

his first wife more than any of the others. If he is convicted of the contrary, he is flogged. So, too, in the older laws may be found many prescripts concerning integrity and honour, things that are wholly internal and do not fall within the province of legislation. But as to the oath, where the matter is laid upon the conscience, integrity and honour must be viewed as in it outwardly substantive.

214. Besides applying to the particular as a whole, the constituted law applies to the special case. Here it enters the quantitative region left unoccupied by the conception. This is, of course, the abstract quantitative, which is found in exchange as value. The conception furnishes in this region only a general limit, inside of which there is room for considerable uncertainty. But fluctuations of opinion must be cut short, and a conclusion reached. Hence, inside of this limit a decision has the character of accident and caprice. Note. To whittle the universal down not only to the particular but to the individual case is the chief function of the purely positive in law. It cannot, for example, be determined by reason, or decided by any phase of the conception itself, whether forty lashes or thirty-nine, a fine of four dollars or three dollars and ninety-nine cents, imprisonment for a year or three hundred and sixty-four or three hundred and sixty-six days, be the just punishment for a crime. And vet a lash, a cent, or a day too much or too little is an injustice. Reason itself recognizes that contingency, contradiction, and appearance have their sphere or right, limited though it is, and is not at pains to rectify these contraditions. Here the purpose is solely to reach actuality, that is, somehow or other within the given limit to get the matter settled. This settlement is the office of formal self-certitude or abstract subjectivity, which, observing the prescribed limit, may bring the matter to issue simply for settlement's sake. Or its reasons for its decision are, if it has any, of this kind, that it should use round numbers, or that the number should be forty less one. It is of no real significance that the law

does not make the final decision demanded by reality, but hands it over to the judge, limiting him merely by a maximum and minimum. The maximum and minimum are themselves round numbers, and do not do away with the requirement that the judge shall pronounce a finite purely positive sentence. On the contrary, this action devolves upon him necessarily. Addition. Undoubtedly the laws and the administration of justice contain in one of their aspects something contingent, since the law, though of a universal character, must nevertheless be applied to special cases. If we were to declare against this element of contingency, we would pronounce in favour of an abstraction. The exact quantity of punishment cannot be found in any factor of the conception; and whatever judgment may be made, it is to some extent arbitrary. But this contingency is itself necessary. If one were to argue from the presence of contingency that a code of laws was imperfect, he would overlook the fact that perfection of such a kind is not to be attained. Law must, hence, be taken as it stands. (b) Law as Incorporated.

215. Since the binding force of law rests upon the right of self-consciousness (§132 and note), the laws ought to be universally made known. Note. To hang up the laws, as did Dionysius the Tyrant, so high that no citizen could read them, is a wrong. To bury them in a cumbrous apparatus of learned books, collections of decisions and opinions of judges, who have deviated from the rule, and, to make matters worse, to write them in a foreign tongue, so that no one can attain a knowledge of them, unless he has made them a special subject of study, is the same wrong in another form. The rulers, who have given their people a definite and systematized book of common law, or even an unshapely collection such as that of Justinian, should be thanked and lauded as public benefactors. Moreover, they have done a decisive act of justice. Addition. Jurists, who have a detailed knowledge of the law, often look on it as their monopoly. He who

is not of their profession, they say, shall not be heard. The physicists treated Goethe's theory of colours harshly, because he was not of their vocation, and was a poet besides. But we do not need the services of a shoemaker to find out if the shoe fits, nor do we need to belong to a particular trade in order to have a knowledge of the objects which are of universal interest in it. Right concerns freedom, the worthiest and holiest thing in man, the thing which he must know in so far as he is answerable to it.

216. We are in the presence of an antinomy. Simple universal characteristics are needed in a public statute-book and yet the finite material by its nature gives rise to endless definition; the context of any law should be a rounded-off and complete whole, and yet there must continually be new legal findings. But the right to a completed statute-book remains unimpaired, since this antinomy does not occur in the case of fixed general principles, but only with their specialization. General principles can be apprehended and presented apart from special cases. Note. One chief source of complexity in legislation occurs in the case of any historic institution, which in its origin contains an injustice. In the course of time it is sought to infuse into this institution reason and absolute right. An illustration of this procedure was cited above from Roman law (§180, note). It occurs also in the old feudal law and elsewhere. But it is essential to understand that, owing to the nature of finite material, any application to it of principles, absolutely reasonable and in themselves universal, must be an infinite process. To require of a statute-book that it should be absolutely finished, and incapable of any modification — a malady which is mainly German — and to base this demand upon the reason that, if the book cannot be completed, it cannot come up to the so-called imperfect and therefore falls short of reality, rest upon a twofold misunderstanding. This view implies a misconception of the nature of such finite objects as private right, whose so-called perfection consists simply in a perennial approximation. It implies,

too, a misconception of the difference between the universal of the understanding and that of reason, and also of their application to the finite and particular material, which goes on to infinity. Le plus grand ennemi du Bien c'est le Meilleur is the expression of the truly sound human understanding in contrast with empty reasonings and reflections. Addition. If completeness means the complete collection of every individual thing or instance which belongs to a given sphere, no science can be complete. If we say that philosophy or any other science is incomplete, it seems like saying that we must wait till it is perfected, as the best thing may yet be lacking. In this way there is no getting on at all, neither in the seemingly completed science of geometry, in which, nevertheless, new elements are being introduced, nor in philosophy, which, though dealing with the universal idea, may be continually more and more specialized. The universal law cannot be forever merely the ten commandments. Yet it would be absurd to refuse to set up the law "Thou shalt not kill" on the ground that a statute-book cannot be made complete. Every statute-book can, of course, be better. It is patent to the most idle reflection that the most excellent, noble, and beautiful can be conceived of as still more excellent, noble, and beautiful. A large old tree branches more and more without becoming a new tree in the process; it would be folly, however, not to plant a new tree for the reason that it was destined in time to have new branches.

217. In the civic society what is intrinsically right becomes law. What was formerly the simple and abstract realization of my private will becomes, when recognized, a tangible factor of the existing general will and consciousness. Acquisition of property and other such transactions must therefore be settled in accordance with the form assigned to this realized right. Hence, property now depends upon contract, and, in general, upon those formalities, which furnish legal proof of possession. Note. The original or direct titles to property and methods of acquisition (§54 and fol.)

disappear in the civic community, or occur in it only as separate accidents and limited elements. Forms are rejected by feeling, which holds to the subjective, and by reflection, which clings to the abstract side of the necessary formality. On the other hand the dead understanding clings to formalities in opposition to the thing itself, and infinitely increases their number. For the rest it is involved in the whole process of education to win oneself free by hard and long endeavour from the sensuous and direct form, and attain to the form of thought with its appropriate simple expression. It is only in the earliest stages of legal science that ceremony and formalities are significant. They are then esteemed as the thing itself rather than its outer symbol. In Roman law is found a host of details and expressions, which formerly belonged to religious ceremonies, and should in law have given place to phases of thought and their appropriate expression. Addition. In law what is in itself right is constituted. In property I possess something which was without an owner; this must now be recognized and constituted as mine. Hence, with regard to property arise in a community legal forms. We place boundary stones as a sign for others to take notice of; we have registers of mortgages and lists of properties. In the civic community property is generally obtained by contract, a legal process which is fixed and definite. Against forms the objection may be urged that they exist merely to bring money to the authorities. Or they may be held to be objectionable as indicating a lack of confidence. It may be said that the maxim "A man is his word" has lost its force. But the essential thing about the form is that what is really right should be constituted as right. My will is rational; it has validity; and this validity is to be recognized by others. Here my subjectivity and that of others must fall away, and the will must attain a certainty, assurance, and objectivity, which can be realized only through the form.

218. In the civic community property and personality have a legal recognition and validity. Hence, crime is injury done not merely to an infinite subject, but to a universal fact, which has firm and sure reality. Here occurs, therefore, the view that crime is a menace to society. On the one hand the magnitude of the crime is increased, but on the other hand the security, felt by society, lessens the external importance of the injury. As a result, crime is now often punished more lightly. Note. The fact that, when one member of a community suffers, all others suffer with him, alters the nature of crime, not indeed in its conception, but in its external existence. The injury now concerns the general thought and consciousness of the civic community, and not merely the existence of the person directly injured. In the heroic ages, portrayed in the tragedies of the ancients, the citizens did not regard themselves as injured by the crimes which the members of the royal houses committed against one another. Crime, which in its inner nature is an infinite injury, must as a realized fact submit to a qualitative and quantitative measure (§96). This outward fact is conditioned by the general idea and consciousness of the validity of the laws. Hence, the danger to the civic community is one way of measuring the magnitude of a crime, or one of its attributes. The quality or magnitude varies with the condition of a community. In the circumstances lies the justification of inflicting upon a theft of a few cents or a turnip the penalty of death, while it imposes a mild punishment upon a theft of a hundred or several hundred times the amount. Although the idea of danger to the civic community seems to aggravate the crime, it has really ameliorated the penalty. A penal code belongs to its time and to the condition in which the civic community at that time is. Addition. An offence seems to be aggravated, if it is perpetrated in a community, and yet in such a case it is treated with more leniency. This appears to be self-contradictory. But although a crime could not be allowed by the community to go unpunished, since it would then be

constituted as right, yet, because a community is sure of itself, a crime is always merely a single, isolated act of hostility without any foothold. By means of the very steadfastness of the community crime becomes a mere subjective act, which appears to spring not so much out of deliberate will as out of natural impulse. Hence, a more lenient view is taken of crime, and punishment also is ameliorated. If the community is still unsettled, an example must be made by means of punishment, for punishment is itself an example against the example of crime. But in the sure and firm community the position of crime is so unstable, that a lesser measure of punishment is sufficient to supersede it. Severe punishments are not absolutely unjust, but are due to the condition of the time. A criminal code cannot apply to all times, and crimes are mere seeming existences, which draw after them a greater or less rejection of themselves.(c) The Court of Justice.

219. Right, having entered reality in the form of law, and having become an actual fact, stands in independent opposition to the particular will and opinion of right, and has to vindicate itself as a universal. The recognition and realization of right in each special case without the subjective instigation of private interests, is the office of a public power, the court of justice. Note. The office of judge and the court of justice may have originated historically in the patriarchal relation, in force, or in voluntary choice. This is for the conception of the object a matter of indifference. To regard the administration of justice by princes and rulers merely as a courtesy and favour, as does Herr von Haller in his “Restoration of Political Science,” is to have no inkling of the fact that, when we speak of law and the state, we mean that its institutions are reasonable and absolutely necessary; and that, when we consider the reasonable basis of the laws, we have nothing to do with the form of their origin. The extreme opposite to this view is the crude idea that the administration of justice is club-law or despotism, which suppressed liberty by violence. But the administration of

the law is to be looked upon as the duty quite as much as the right of the public authority. Whether to delegate the discharge of this office to some power or not is not at the option of any individual.

220. Revenge, or the right against crime (§102), is right only in itself. It is not right in the form of law, i.e., it is not in its actual existence just. The place of the injured person is now taken by the injured universal, which is actualized in a special way in the court of justice. To pursue and punish crime is its function, which therefore ceases to be a mere subjective retaliation or revenge, and is in punishment transformed into a true reconciliation of right with itself. In the act of punishment, viewed objectively, right is reconciled to itself, and restores itself by superseding the crime and realizing its own inherent validity. In punishment, viewed subjectively, or from the standpoint of the criminal, the law, known by him and available for his protection, is atoned for. The execution of the law upon him, or the satisfaction of justice, he finds to be simply the completed act of his own law.

221. A member of the civic community has the right to bring a cause before the court of justice, and is also in duty bound to appear in the court, and accept from it the decision of the point in dispute. Addition. Every individual has the right to bring his case before the court. But he must know the laws, otherwise the privilege would be of no service to him. But it is also a duty for him to appear before the court. Under the feudal system the prince or noble defied the court, and refused to appear, regarding it as a wrong if the court summoned him before it. This condition of things is contradictory of the real function of the court. In more recent times the prince has in private affairs recognized the courts as superior to him, and in free states his cases are usually lost.

222. By the court it is required that a right be proved. The legal process gives the contending parties an opportunity to substantiate their claim by

evidence, and put the judge in possession of a knowledge of the case. The necessary steps are themselves rights; their course must be legally fixed; and they form an essential part of theoretical jurisprudence. Addition. It may stir men to revolt if they have a right, which is refused to them on the score that it cannot be proved. But the right, which I have, must be at the same time constituted. I must be able to present and prove it, and only when that, which it really is, is constituted as law, is it of any avail to me in a community.

223. The stages of the legal process may be more and more minutely subdivided, and each stage has its right. As this subdivision has no inherent limit, the legal process, which is already of itself a means, may be opposed to the end, and become something external. Though this extensive formality is meant for the two contending parties and belongs to them as their right, it may become an evil and an instrument of wrong. Therefore, in order that the two parties, and right itself as the substantive basis, may be protected against the legal process and its misuse, it is by way of law made a duty for them to submit themselves to a simple court, the civil court of arbitration, for a preliminary trial, before going to the higher court. Note. Equity includes a departure from formal right through moral and other regards, and refers directly to the content of the suit. A court of equity decides upon the particular case, without adhering to the formalities of the legal process. It is not confined to the objective evidence, as is formal law. It decides upon the interest peculiar to each particular suit, Its judgment is not meant to be applied generally.

224. As the public promulgation of the laws is one of the rights of the subjective consciousness (§215), so also is the possibility of knowing how in any special case the law is carried out. The course of the external proceedings should be public, and also the legal principles involved. The order of procedure is of itself a thing of general value. Though the special

content of the case is of interest only to the contending parties, the universal content, involving right and a legal decision, is of interest to all. Hence is demanded the publicity of the administration of the law. Note. Deliberations by the members of a court amongst themselves over the judgment to be given, are only private opinions and views, and are not of public import. Addition — Honest common sense holds that the publicity of legal proceedings is right and just. A strong reason to the contrary was always the rank of the judiciary. They were not to be seen by everybody, and regarded themselves as the warders of a law, into which laymen ought not to intrude. But law should possess the confidence of the citizens, and this fact calls for the publicity of the sentence. Publicity is a right, because the aim of the court is justice, which as a universality belongs to all. Moreover, the citizens should be convinced that the right sentence has actually been pronounced.

225. In the application of the law by the judicial authorities to special cases are to be distinguished two separate aspects. There must be firstly an acquaintance with the direct facts of the case, whether a contract has taken place, an injurious act done, and who the doer is. In criminal law the act must be known also in its intention, which contains its substantive criminal quality (§119, note). In the second place the act must be brought under the law of the restoration of right. This in criminal law includes the punishment. Decisions in connection with these two aspects are two different functions. Note. In the constitution of the Roman law-courts these two functions occurred in this way. The Proctor gave his decision on the condition that the case was of such and such a kind, and then he commanded a certain Judex to makes inquiries into its exact nature. The fixing of the exact criminal quality of an act, whether, for example, it be murder or manslaughter, is in English judicial procedure left to the insight or caprice of the accuser, and the court is restricted to his view, even if it is seen to be wrong.

226. To conduct the whole inquiry, to arrange the procedure of the parties, which is itself a right (§222), and to pass sentence, are the special functions of the judge (§225). For him, as the organ of the law, the case must be prepared and brought under some law. It must be raised out of its empirical nature, and made a recognized fact with general attributes.

227. That aspect of the case, which consists in knowing and estimating the direct facts, contains no distinctively judicial elements. The knowledge is possible to any intelligent man. When, in order that an estimate of the act may be made, the subjective factor of the insight or intention of the agent is essential (see Second Part), when the evidence concerns no abstract object of reason or the understanding, but mere particulars, circumstances, and objects of sensible perception and subjective certitude, when the case contains no absolutely objective element, and the duty of deciding must fall to subjective conviction and conscience (animi sententia), and when the evidence rests on depositions and statements, the oath, though a subjective confirmation, is ultimate. Note. — In this question it is a cardinal point to keep before our eyes the nature of the available evidence, and to distinguish it from knowledge and evidence of other kinds. To prove a phase of reason, such as is the conception of right itself, that is, to recognize its necessity, requires another method than the proof of a geometrical theorem. Moreover, in a theorem the figure is determined by the understanding, and is already abstractly made according to a law. But in the case of an empirical content, such as a fact, the material for knowledge is composed of sense-perceptions, and attestations based on the subjective certitude of sense. These depositions, testimonies, and circumstances must be put together, and from them a conclusion must be drawn. With such material and such a means of making it independent and objective there is attained only partial proofs. In obedience to a true logic, which nevertheless is formally illogical, the punishments are consequently exceptional. This objective truth is quite

different from the truth of a rational principle or of a proposition, whose matter has already been abstractly fixed by the understanding. In so far as an empirical truth can be recognized in the specific judicial finding of a court, and so far as in the finding can be shown to lie an unique quality, that is, an exclusive implicit right and necessity, the formal judicial court is entitled to pass judgment upon the fact as well as upon the point of law. Addition. There is no reason for supposing that the judge is the only one to decide upon matters of fact. For this not the legal mind alone but any man of ordinary intelligence is competent. Judgment as to matter of fact depends upon empirical circumstances, witnesses of the act, and similar data of perception. There may also be other facts, by means of which one can infer the nature and probability of the act in dispute. Here at most we reach an assurance, but not a truth in the sense of something eternal. Assurance is subjective conviction or conscience, and the question to decide is what form to give this certitude at a law court. The demand, usually made in German law, for a confession on the part of the criminal has this right, that by it satisfaction is given to the right of the subjective consciousness. The judge's decision must agree with the criminal's consciousness; and, not until the culprit has confessed, is the sentence free from an element which is foreign to him. But the criminal may deny the act, and thus imperil the course of justice. Yet it is a harsh measure to treat him according to the subjective conviction of the judge, since then he is no longer regarded as free. Hence, it is still required that the decree of guilt or innocence should come from the soul of the criminal, and this requisite is secured through trial by jury.

228. When the facts of the case have been decided on, and the judge in his sentence brings the case, so qualified, under a certain law, the accused's right of self-consciousness is not violated. In the first place, the law is known, and is itself the law of the accused. In the second place the proceedings, by which the case is brought under a certain law, are public.

But when a decision is not yet reached upon the particular subjective and external content of the matter, a knowledge of which comes under the first of the two aspects given in §225, the accused's right of self- consciousness is preserved by intrusting the case to the subjectivity of jurors. This procedure is based on the equality of the jurors with the accused, both as regards class and in general. Note. The right of self-consciousness, or the element of subjective freedom, can be regarded as the substantive point of view in the question of the necessity of a public trial, or trial by a jury. To this point of view all that is essential and needful in these institutions may be reduced. From any other standpoint disputes may arise as to whether this or that feature is an advantage or disadvantage, but such reasonings either are of secondary consequence and decide nothing, or they are taken from other and perhaps higher spheres. It is possible that the law might be as well administered by courts of judges, or even better by them than by other institutions. But grant the possibility, or let the possibility become a probability or even a certainty, there remains always on the other hand the right of self-consciousness, which maintains its claims and must be satisfied. Because of the general nature of the law, it can happen that the knowledge of right, the course of legal proceedings, and the possibility of prosecuting the law, may become the exclusive property of a class. This class may use a language which is to those in whose interest it was made a foreign tongue. The members of a civic community, who have to rely for their subsistence upon their own activity, knowledge, and will, then become strangers not only to what is most private and personal in the law, but also to its substantive and rational essence. Hence, they fall under a kind of bodily vassalage to the legal class. They may have the right to present themselves in person before the court (in judicio stare), but of what use is that, if they are not present as intelligent spirits? The justice, which they receive, remains for them an external fate.

229. In the civic community the idea is lost in particularity, and dispersed by the separation of inner and outer. But in the administration of justice the community is brought back to the conception, that is, to the unity of the intrinsic universal with subjective particularity. But as subjective particularity is present only as one single case, and the universal only as abstract right, the unification is in the first instance relative. The realization of this relative unity over the whole range of particularity is the function of the police, and within a limited but concrete totality constitutes the corporation. Addition. In the civic community universality is only necessity. In the relation of wants, right as such is the only steadfast principle. But the sphere of this right is limited, and refers merely to the protection of what I have. To right as such, happiness is something external. Yet in the system of wants well-being is an essential element. The universal, which is at first only right, has to spread itself over the whole field of particularity. Justice, it is true, is a large factor in the civic community. The state will flourish, if it has good laws, of which free property is the fundamental condition. But since I am wholly environed by my particularity, I have a right to demand that in connecting myself with others I shall further my special happiness. Regard to my particular well- being is taken by the police and the corporation.

C. Police and Corporation.

230. IN THE system of wants the subsistence and happiness of every individual is a possibility, whose realization is conditioned by the objective system of wants. By the administration of justice compensation is rendered for injury done to property or person. But the right, which is actualized in the particular individual, contains the two following factors. It asks firstly that person and property should be secured by the removal of all fortuitous hindrances, and secondly that the security of the individual's subsistence and happiness, his particular well-being should be regarded and actualized as a right. (a) Police.

231. So far as the particular will is the principle of a purpose, the force, by which the universal guarantees security, is limited to the realm of mere accident, and is an external arrangement.

232. Crimes are in their nature contingent or casual, taking the form of capricious choice of evil, and must be prevented or brought to justice by the general force. Apart from them, however, arbitrary choice must be allowed a place in connection with acts in themselves lawful, such as the private use of property. Here it comes into external relation with other individuals, and also with public institutions for realizing a common end. In this way a private act is exposed to a haphazard play of circumstances, which take it beyond my control. It thus or actually does effect an injury or wrong to others.

233. This is, indeed, only a possibility of harm. But that no actual injury is done is now no longer a matter of accident, since the aspect of wrong in private acts is the ultimate ground for the right of police control.

234. The relations of external reality occur within the realm of the infinity created by the understanding, and have accordingly no inherent limit. Hence, as to what is dangerous and what not, what suspicious and what free from suspicion, what is to be forbidden, or kept under inspection, or pardoned with a reprimand, what is to be retained after pardon under police supervision, and what is to be dismissed on suspended sentence, no boundary can be laid down. Custom, the spirit of the constitution as a whole, the condition of the time, the danger of the moment, etc., furnish means for a decision. Addition. No fixed definition can here be given, or absolute boundary drawn. Here everything is personal and influenced by subjective opinion. To the spirit of the constitution or the danger of the times are due any more decisive characteristics. In time of war, e.g., many things morally harmless are looked on as harmful. Because of the presence of this aspect of contingency and arbitrary personality the police are viewed with odium. They can by far-fetched conclusions draw every kind of thing within their sphere; for in anything may be found a possibility of harm. Hence, the police may go to work in a pedantic spirit, and disturb the moral life of individuals. But great as the nuisance may be, an objective limit to their action cannot be drawn.

235. Although every one relies on the untrammelled possibility of satisfying his daily wants, yet, when in the indefinite multiplication and limitation of them it is sought to procure or exchange the means and it is desired to expedite the transaction, there comes into sight a common interest, which makes the business of one subserve the interest of all. There appear, likewise, ways and means, which may be of public utility. To oversee and foster the ways and means calculated to promote the public welfare is the function of a public power.

236. The different interests of producers and consumers may come into conflict, and, although the right relation between the two may on the whole

arise of its own accord, yet the adjustment of the two calls for a regulation standing above both sides and put into operation consciously. The right to make such a regulation in any particular case (e.g., taxation of the articles most necessary to sustain life), consists in this, that the public offer of goods, in wide and daily use, is not to the individual, as such, but to him as a universal, i.e., to the public. The people's right to honest dealing and inspection of goods to prevent fraud may be enforced by a public functionary. But more especially does the dependence of great branches of industry upon foreign conditions and distant combinations, which the individuals engaged in these industries cannot themselves oversee, make necessary a general supervision and control. Note. In contrast with freedom of business and trade in the civic community stands the other extreme of the establishment and direction of the work of all by means of official regulation. Under this head comes perhaps the construction of the pyramids and other monstrous Egyptian and Asiatic works. They were built for public ends without the intervention of any work done by the individual to further his own private interests. Private interest summons the principle of freedom against interference from above, but the more blindly it is sunk in self-seeking ends, the more it stands in need of regulation, in order that it may be led back to the universal. Thus what might be a dangerous upheaval becomes largely harmless, and shorter time is left for conflicts to adjust themselves merely by unconscious necessity. Addition. Police control and provision are intended to intervene between the individual and the universal possibility of obtaining his wants. It takes charge of lighting the streets, building bridges, taxation of daily wants, even of health. Two main views stand out at this point. One view is that it falls to the police to look after everything the other that the police should not interfere at all, since every one will be guided by the need of others. The individual, it is true, must have the right to earn his bread in this or the other way, but on the other

hand the public has a right to ask that what is necessary shall be done. Both claims should be met, and the freedom of trade ought not to be of such a kind as to endanger the general weal.

237. The possibility of sharing in the general wealth is open to the individual and secured to him by public regulations. This security, however, cannot be complete, and in any case the possibility of sharing in the general wealth is from the subjective side open to casualties, just in proportion as it presupposes conditions of skill, health, and capital.

238. In the first instance the family is the substantive whole. To it falls the duty of providing for the particular side of the individual's life, both in regard of the means and talents requisite for winning his maintenance out of the common stock, and in regard of subsistence and provision in case of disability. But the civic community tears the individual out of the family bonds, makes its members strangers to one another, and recognizes them as independent persons. Instead of external inorganic nature and the paternal soil, from which the individual drew subsistence, the community substitutes its own ground, and subjects the whole family to fortuitous dependence upon itself. Thus the individual has become the son of the civic community, which makes claims upon him, at the same time as he has rights to it. Addition. The family has, of course, to provide bread for individuals; but in the civic community the family is subordinate and merely forms a basis. After that it is no longer of such extensive efficacy. Rather is the civic community the monster, which snatches man to itself, claims from him that he should toil for it and that he should exist through it and act by means of it. If man is a member of such a community, he has just such rights in it or claims upon it as he had in and upon the family. The civic community must protect its members, and defend their rights, as they in turn are engaged to obey its mandates.

239. The civic community, in its character as universal family, has the right and duty to supersede, if necessary, the will of the parents, and superintend the education of the young, at least in so far as their education bears upon their becoming members of the community. Especially is this the case if the education is to be completed not by the parents but by others. Further, the community must undertake general arrangements for education, in so far as they can be made. Addition. The boundary line between the rights of parents and those of the civic community is hard to define. The parents generally suppose themselves to possess complete liberty with regard to education, and to be able to do whatever they wish. Whenever instruction is made public, the chief opposition usually comes from the parents, who cry out and make acclaim about teachers and schools merely because they are displeased with them. In spite of this, the community has the right to proceed according to tried methods, and to compel parents to send their children to school, to have them vaccinated, etc. Contests occur in France between the demands of free instruction, i.e., of the pleasure of parents, on the one side, and the oversight of the state on the other.

240. Similarly, the community has the duty and right to take under its guardianship those who wantonly squander their subsistence and that of their family. In the place of this extravagance it substitutes their real end, which it seeks to promote along with the purpose of the community. Addition. It was a law in Athens that every citizen should give an account of his way of life. Our view is that this is no one's business. Of course every individual is in one way independent, but he is also a member of the system of the civic community. In so far as every man has the right to ask maintenance from it, it must also protect him against himself. It is not simply that starvation must be guarded against. The wider view is that there never shall arise a rabble, or mass. Since the civic community is obliged to

support individuals, it has also the right to insist that individuals should care for its subsistence.

241. Not the arbitrary will only, but accidental circumstances, which may be physical or external (§200), may bring the individual to poverty. This condition exposes him to the wants of the civic community, which has already deprived him of the natural methods of acquisition (§217), and superseded the bond of the family stock (§181). Besides, poverty causes men to lose more or less the advantage of society, the opportunity to acquire skill or education, the benefit of the administration of justice, the care for health, even the consolation of religion. Amongst the poor the public power takes the place of the family in regard to their immediate need, dislike of work, bad disposition, and other vices, which spring out of poverty and the sense of wrong.

242. The subjective element of poverty, or generally the distress, to which the individual is by nature exposed, requires subjective assistance, both in view of the special circumstances, and out of sympathy and love. Here, amidst all general arrangements, morality finds ample room to work. But since the assistance is in its own nature and in its effects casual, the effort of society shall be to discover a general remedy for penury and to do without random help. Note. Haphazard almsgiving and such foundations as the burning of lamps beside holy images, etc., are replaced by public poor-houses, hospitals, street lighting, etc. To charity enough still remains. It is a false view for charity to restrict its help to private methods and casual sentiment and knowledge, and to feel itself injured and weakened by regulations binding upon the whole community. On the contrary, the public system is to be regarded as all the more complete, the less remains to be done by special effort.

243. When the civic community is untrammelled in its activity, it increases within itself in industry and population. By generalizing the

relations of men by the way of their wants, and by generalizing the manner in which the means of meeting these wants are prepared and procured, large fortunes are amassed. On the other side, there occur repartition and limitation of the work of the individual labourer and, consequently, dependence and distress in the artisan class. With these drawbacks are associated callousness of feeling and inability to enjoy the larger possibilities of freedom, especially the mental advantages of the civic community.

244. When a large number of people sink below the standard of living regarded as essential for the members of society, and lose that sense of right, rectitude, and honour which is derived from self-support, a pauper class arises, and wealth accumulates disproportionately in the hands of a few. Addition. The way of living of the pauper class is the lowest of all, and is adopted by themselves. But with different peoples the minimum is very different. In England even the poorest man believes that he has his right, and with him this standard is different from that which satisfies the poor in other lands. Poverty does not of itself make a pauper. The pauper state implies a frame of mind, associated often with poverty, consisting in inner rebellion against the wealthy, against society, and against constituted authority. Moreover, in order to descend to the class, which is at the mercy of the changes and chances of life, men must be heedless and indifferent to work, as are the Lazzaroni in Naples. Hence, in this section of the community arises the evil thing that a man has not self-respect enough to earn his own living by his work, and still he claims support as a right. No man can maintain a right against nature. Yet, in social conditions want assumes the form of a wrong done to one or other class. The important question, how poverty is to be done away with, is one which has disturbed and agitated society, especially in modern times.

245. If upon the more wealthy classes the burden were directly laid of maintaining the poor at the level of their ordinary way of life, or if in public institutions, such as rich hospitals, foundations, or cloisters, the poor could receive direct support, they would be assured of subsistence without requiring to do any work. This would be contrary both to the principle of the civic community and to the feeling its members have of independence and honour. Again, if subsistence were provided not directly but through work, or opportunity to work, the quantity of produce would be increased, and the consumers, becoming themselves producers, would be proportionately too few. Whether in the case of over-production, then, or in the case of direct help, the evil sought to be removed would remain, and, indeed, would by either method be enhanced. There arises the seeming paradox that the civic community when excessively wealthy is not rich enough. It has not sufficient hold of its own wealth to stem excess of poverty and the creation of paupers. Note. These phenomena may be studied in England, where they occur on an extensive scale. In that country may also be observed the consequences of poor rates, of vast foundations, of unlimited private benevolence, and, above all, of the discontinuance of the corporation. In England, and especially in Scotland, the most direct remedy against poverty and against laziness and extravagance, which are the cause of poverty, has been proved by practical experience to be to leave the poor to their fate, and direct them to public begging. This, too, has been found to be the best means for preserving that sense of shame and honour, which is the subjective basis of society.

246. By means of its own dialectic the civic community is driven beyond its own limits as a definite and self-complete society. It must find consumers and the necessary means of life amongst other peoples, who either lack the means, of which it has a superfluity, or have less developed industries.

247. As the firm-set earth, or the soil, is the basis of family life, so the basis of industry is the sea, the natural element which stimulates intercourse with foreign lands. By the substitution for the tenacious grasp of the soil, and for the limited round of appetites and enjoyments embraced within the civic life, of the fluid element of danger and destruction, the passion for gain is transformed. By means of the sea, the greatest medium of communication, the desire for wealth brings distant lands into an intercourse, which leads to commercial exchange. In this intercourse is found one of the chief means of culture, and in it, too, trade receives world-historical significance. Note. Rivers are not natural boundaries, though people have in modern times tried to make them so. Rather do they, and more especially the sea, bind men together. That Horace (Carm. I. 3) is wrong when he says:

"... deus abscidit Prudens Oceano dissociabili Terras,..."

is shown by the general fact that basins of rivers are inhabited by one nation or race. This is proved even more conspicuously by the relations of ancient Greece with Ionia and Magna Graecia, of Brittany with Britain, of Denmark with Norway, of Sweden with Finland and Lapland, in contrast with the slight intercourse obtaining between the inhabitants of the coast and those of the interior. We have only to compare the position of the nations, who have frequented the sea, with that of the nations who have avoided it, in order to discover what a means of culture and commerce it really is. Observe how the Egyptians and Hindoos have become dull and insensible, and are sunk in the grossest and most shameful superstitions, while all the great aspiring nations press to the sea.

248. The wider connection due to the sea becomes a means for colonization, to which, be it sporadic or systematic, the full-grown civic

community finds itself impelled. Thus for a part of its population it provides on a new soil a return to the family principle, and also procures for itself at the same time a new incentive and field for work. Addition. The civic society is forced to found colonies, owing to the increase of population, but more especially because production oversteps the needs of consumption, and the growing numbers cannot satisfy their needs by their work. Sporadic colonization occurs mainly in Germany, the colonists, finding a home in America or Russia, being without any connection with and of no benefit to their native land. A

different kind of colonization is the systematic, which is conducted by the state consciously and with suitable appliances. Of this kind of colonization many forms occurred amongst the ancients, especially the Greeks. In Greece the citizens did not engage in severe toil, but directed their energies to public affairs. When the population grew to such an extent that it was difficult to provide for them, the youth were sent into a new neighbourhood, which, was sometimes chosen for them, sometimes left to the accident of discovery. In modern times colonists have not been granted the rights possessed by the inhabitants of the parent country. The result has been war and ultimate independence, as may be read in the history of the English and Spanish colonies. The independence of the colonies has turned out to be of the greatest advantage to the mother land, just as the liberation of the slaves was of the greatest advantage to the masters.

249. The universal, which is contained in the particularity of the civic community, is realized and preserved by the external system of police supervision, whose purpose is simply to protect and secure the multitude of private ends and interests subsisting within it. It has also the higher function of caring for the interests which lead out beyond the civic community (§246). In accordance with the idea particularity itself makes the universal, which exists in its special interests, the end and object of its will and

endeavour. The ethical principle thus comes back as a constituent element of the civic community. This is the corporation. (b) The Corporation.

250. In its substantive family life and life of nature the agricultural class contains directly the concrete universal in which it lives. The universal class, again, has this universal as an independent end of its activity, and as its ground and basis. The middle or commercial class is essentially engaged with the particular, and hence its peculiar province is the corporation.

251. The work of the civic community spreads in different directions in obedience to the nature of its particularity. Since the implicit equality, contained in particularity, is here realized as the common purpose of an association, the particular and self-seeking end becomes something actively universal. Each member of the civic community is with his special talent a member of the corporation. The universal aim of the corporation is accordingly quite concrete, and has no wider application than what lies in trade and its distinctive interests.

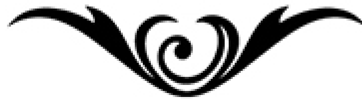
252. In keeping with this view, the corporation, under the oversight of the public authority, has the right to look after its own clearly-defined interests, according to the objective qualifications of skill and rectitude to adopt members, whose number is determined by the general system, to make provision for its adherents against fortuitous occurrences, and to foster the capacity necessary in any one desiring to become a member. In general it must stand to its members as a second family, a position which remains more indefinite than the family relation, because the general civic community is at a farther remove from individuals and their special needs. Note. The tradesman is different from the day-labourer, as well as from him who is ready for any casual employment. The trader, be he employer or employee, is a member of an association, not for mere accidental gain but for the whole circuit of gain, or the universal involved in his particular maintenance. The privileges, which are rights of a corporate branch of the

civic community, are not the same as special privileges in the etymological sense of the term. Special privileges are haphazard exceptions to a general law, but the other privileges are legal phases of the particularity of an essential branch of the community.

253. The corporation provides for the family a basis and steady means (§170), by securing for it a subsistence varying according to capacity. Moreover, both security and capacity are in the corporation publicly recognized. Hence, the member of a corporation does not need to certify his capacity or the reality of his regular income to any larger outside organization. It is also recognized that he belongs to and has active interest in a whole, whose aim is to promote the welfare of society in general. Thus, in his class he has honour. Note. The corporation, in making secure the means of the family, corresponds to agriculture and private property in another sphere (§203, note). When it is complained that the luxury and extravagance of the commercial class give rise to paupers (§244), it must not be overlooked that these conditions have an ethical or social basis in such causes as the increasingly mechanical nature of work. If the individual is not a member of an authorized corporation, and no combination can be a corporation unless it is authorized, he has no class-honour. By limiting himself to the self-seeking side of trade and his own subsistence and enjoyments, he loses standing. He perhaps seeks, in that case, to obtain recognition by displaying his success in his trade; but his display ha s no limit, because he has no desire to live in a way becoming his class. Indeed, he has no class at all, since only what is of general purport really exists in a civic community, and can be established and recognized. As he has no class, he has not the more universal life characteristic of the class. In the corporation the assistance received by poverty loses its lawless character, and the humiliation wrongly associated with it. The opulent, by performing

their duty to their associates, lose their pride, and cease to stir up envy in others. Integrity receives its due honour and recognition.

254. The corporation sets a limit to the so-called natural right to make acquisitions by the exercise of any skill, only so far as the limit is a rational one. This right is thus freed from mere opinion and random influences, and from danger to itself and others. In this way it wins recognition and an assured place, and is exalted to the level of a conscious effort to attain a common purpose.



255. As the family was the first, so the corporation, grounded upon the civic community, constitutes the second ethical root or basis of the state. The family contains the elements of subjective particularity and objective universality in substantive unity. Then, in the civic community, these elements are in the first instance dissociated and become on the one side a particularity of want and satisfaction, which is turned back into itself, and on the other side abstract legal universality. The corporation joins these two in an internal way, so that particular wellbeing exists and is realized as a right. Note. Sanctity in the marriage tie and honour in the corporation are the points which the disorganizing forces of the civic community assail. Addition. In modern times the corporation has been superseded, with the intention that the individual should care for himself. Grant that the intention is wise, yet the obligation of the individual to procure his own livelihood is not by the corporation altered. In our modern states the citizens participate only slightly in the general business. It is, however, needful to provide the ethical man with a universal activity, one above his private ends. This universal, with which the modern state does not always supply him, is given by the corporation. We have already seen that the individual, while maintaining himself in the civic community, acts also for others. But this unconscious necessity is not enough. It is in the corporation that a conscious and reflective ethical reality is first reached. The superintendence of the

state is higher, it is true, and must be given an upper place; otherwise the corporation would become fossilized; it would waste itself upon itself, and be reduced to the level of a wretched club. But the corporation is not in its absolute nature a secret society, but rather the socializing of a trade, which without it would stand in isolation. It takes the trade up into a circle, in which it secures strength and honour.

256. The limited and finite end of the corporation has its truth in the absolutely universal end and the absolute actuality of this end. This actualized end is also the truth of the division involved in the external system of police, which is merely a relative identity of the divided elements. Thus, the sphere of the civic community passes into the state. Note. City and country are the two as yet ideal constituents, out of which the state proceeds. The city is the seat of the civic society, and of the reflection which goes into itself and causes separation. The country is the seat of the ethical, which rests upon nature. The one comprises the individuals, who gain their livelihood by virtue of their relation to other persons possessed of rights. The other comprises the family. The state is the true meaning and ground of both. The development of simple ethical observance into the dismemberment marking the civic community, and then forward into the state, which is shown to be the true foundation of these more abstract phases, is the only scientific proof of the conception of the state. Although in the course of the scientific exposition the state has the appearance of a result, it is in reality the true foundation and cause. This appearance and its process are provisional, and must now be replaced by the state in its direct existence. In actual fact the state is in general primary. Within it the family grows into the civic community, the idea of the state being that which sunders itself into these two elements. In the development of the civic community the ethical substance reaches its infinite form, which contains the following elements: — (1) infinite differentiation even to the point at

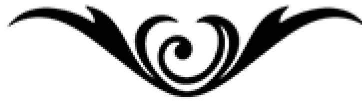
which consciousness as it is in itself exists for itself, and (2) the form of universality, which in civilization is the form of thought, that form by which spirit is itself in its laws and institutions. They are its thought will, and it and they together become objective and real in an organic whole.

Third Section: The State.

257. THE STATE is the realized ethical idea or ethical spirit. It is the will which manifests itself, makes itself clear and visible, substantiates itself. It is the will which thinks and knows itself, and carries out what it knows, and in so far as it knows. The state finds in ethical custom its direct and unreflected existence, and its indirect and reflected existence in the self-consciousness of the individual and in his knowledge and activity. Self-consciousness in the form of social disposition has its substantive freedom in the state, as the essence, purpose, and product of its activity. Note. The Penates are the inner and lower order of gods; the spirit of a nation, Athene, is the divinity which knows and wills itself. Piety is feeling, or ethical behaviour in the form of feeling; political virtue is the willing of the thought-out end, which exists absolutely.

258. The state, which is the realized substantive will, having its reality in the particular self- consciousness raised to the plane of the universal, is absolutely rational. This substantive unity is its own motive and absolute end. In this end freedom attains its highest right. This en4 has the highest right over the individual, whose highest duty in turn is to be a member of the state. Note. Were the state to be considered as exchangeable with the civic society, and were its decisive features to be regarded as the security and protection of property and personal freedom, the interest of the individual as such would be the ultimate purpose of the social union. It would then be at one's option to be a member of the state. But the state has a totally different relation to the individual. It is the objective spirit, and he has his truth, real existence, and ethical status only in being a member of it. Union, as such, is itself the true content and end, since the individual is

intended to pass a universal life. His particular satisfactions, activities, and way of life have in this authenticated substantive principle their origin and result. Rationality, viewed abstractly, consists in the thorough unity of universality and individuality. Taken concretely, and from the standpoint of the content, it is the unity of objective freedom with subjective freedom, of the general substantive will with the individual consciousness and the individual will seeking particular ends. From the standpoint of the form it consists in action determined by thought-out or universal laws and principles; — This idea is the absolutely eternal and necessary being of spirit. The idea of the state is not concerned with the historical origin of either the state in general or of any particular state with its special rights and characters. Hence, it is indifferent whether the state arose out of the patriarchal condition, out of fear or confidence, or out of the corporation. It does not care whether the basis of state rights is declared to be in the divine, or in positive right, or contract, or custom. When we are dealing simply with the science of the state, these things are mere appearances, and belong to history. The causes or grounds of the authority of an actual state, in so far as they are required at all, must be derived from the forms of right, which have validity in the state. Philosophic investigation deals with only the inner side of all this, the thought conception. To Rousseau is to be ascribed the merit of discovering and presenting a principle, which comes up to the standard of the thought, and is indeed thinking itself, not only in its form, such as would be a social impulse or divine authority, but in its very essence. This principle of Rousseau is will. But he conceives of the will only in the limited form of the individual will, as did also Fichte afterwards, and regards the universal will not as the absolutely reasonable will, but only as the common will, proceeding out of the individual will as conscious. Thus the union of individuals in a state becomes a contract, which is based upon caprice, opinion, and optional, explicit consent. Out of this view the



understanding deduces consequences, which destroy the absolutely divine, and its absolute authority and majesty. Hence, when these abstractions attained to power, there was enacted the most tremendous spectacle which the human race has ever witnessed. All the usages and institutions of a great state were swept away. It was then proposed to begin over again, starting from the thought, and as the basis of the state to will only what was judged to be rational. But as the undertaking was begun with abstractions void of all ideas, it ended in scenes of tragic cruelty and horror. As against the principle of the individual will we must bear in mind the fundamental conception that the objective will is in itself rational in its very conception, whether or not it be known by the individual or willed as an object of his good pleasure. We must also keep in mind that the opposite principle, the subjectivity of freedom, i.e., such knowing and willing as are retained in that principle, contains only one, and that a one-sided factor of the idea of the reasonable will. The will is reasonable only if it is so both in itself and when it is actualized. The other contrary of the thought, which apprehends the state as an embodiment of reason, is the theory which takes such external appearances as the accidents of distress, need, protection, strength, and wealth, for the substance of the state, when they are mere elements of its historical development. Moreover, it is in unique and isolated individuals that the principle of knowledge is here said to be found, not however in their thought, but in the attributes of their merely empirical personalities, such as strength or weakness, wealth or poverty. The freak of disregarding is absolutely infinite and reasonable in the state and of banishing thought from the constitution of the state's inner nature has never appeared so undisguisedly as in Mr. v. Haller's "Restauration der Staatswissenschaft." In all genuine attempts to reach the real nature of the state, though the principles adduced be ever so one-sided and superficial, there is yet implied that rightly to conceive of the state is to attain to thoughts and universal

characters. But in the book alluded to, the author not only consciously renounces both the rational content, which is the state, and the form of thought, but passionately inveighs against them. One of what he himself calls the far-reaching effects of his work is due to the circumstance that in his inquiry he knew how to fasten the whole into one piece without the help of thought. Hence, he says, are absent the confusion and disturbance, which arise when into a discussion of the contingent is foisted a suggestion about the substantive, and into a discussion of the empirical and external is injected a reminder of the universal and rational. Hence, when engaged with the inadequate and imperfect he is not continually reminding his readers of what is higher and infinite. Yet even this method of inquiry has consequences. Since the fortuitous is taken as the essence of the state, and not the substantive, there results from the absence of thought an incoherence, which jogs on without looking back, and finds itself quite at home in the very opposite of what it had commended a moment before.11
Addition. The state as a completed reality is the ethical whole and the actualization of freedom. It is the absolute purpose of reason that freedom should be actualized. The state is the spirit, which abides in the and there realizes itself consciously; while in nature it is realized only as the other of itself or the sleeping spirit. Only when it is present in consciousness, knowing itself as an existing object, is it the state. In thinking of freedom we must not take our departure from individuality or the individual's self-consciousness, but from the essence of self- consciousness. Let man be aware of it or not, this essence realizes itself as an independent power, in which particular persons are only phases. The state is the march of God in the world; its ground or cause is the power of reason realizing itself as will. When thinking of the idea of the state, we must not have in our mind any particular state, or particular institution, but must rather contemplate the idea, this actual God, by itself. Although a state may be declared to violate

right principles and to be defective in various ways, it always contains the essential moments of its existence, if, that is to say, it belongs to the full formed states of our own time. But as it is more easy to detect shortcomings than to grasp the positive meaning, one easily falls into the mistake of dwelling so much upon special aspects of the state as to overlook its inner organic being. The state is not a work of art. It is in the world, in the sphere of caprice, accident, and error. Evil behaviour can doubtless disfigure it in many ways, but the ugliest man, the criminal, the invalid, the cripple, are living men. The positive thing, the life, is present in spite of defects, and it is with this affirmative that we have here to deal.

259. (a) The idea of the state has direct actuality in the individual state. It, as a self-referring organism, is the constitution or internal state organization or polity. (b) It passes over into a relation of the individual state to other states. This is its external organization or polity. (c) As universal idea, or kind, or species, it has absolute authority over individual states. This is the spirit which gives itself reality in the process of world-history. Addition. The state as an actual thing is pre-eminently individual, and, what is more, particular. Individuality as distinguished from particularity is an element of the idea of the state itself, while particularity belongs to history. Any two states, as such, are independent of each other. Any relation between the two must be external. A third must therefore stand above and unite them. Now this third is the spirit, which gives itself reality in world-history, and constitutes itself absolute judge over states. Several states indeed might form an alliance and pass judgment upon others, or interstate relations may arise of the nature of the Holy Alliance. But these things are always relative and limited, as was the everlasting peace. The sole, absolute judge, which always avails against the particular, is the self-caused self-existing spirit, which presents itself as the universal and efficient leaven of world-history.

A. Internal Polity.

260. THE STATE is the embodiment of concrete freedom. In this concrete freedom, personal individuality and its particular interests, as found in the family and civic community, have their complete development. In this concrete freedom, too, the rights of personal individuality receive adequate recognition. These interests and rights pass partly of their own accord into the interest of the universal. Partly, also, do the individuals recognize by their own knowledge and will the universal as their own substantive spirit, and work for it as their own end. Hence, neither is the universal completed without the assistance of the particular interest, knowledge, and will, nor, on the other hand, do individuals, as private persons, live merely for their own special concern. They regard the general end, and are in all their activities conscious of this end. The modern state has enormous strength and depth, in that it allows the principle of subjectivity to complete itself to an independent extreme of personal particularity, and yet at the same time brings it back into the substantive unity, and thus preserves particularity in the principle of the state. Addition. The peculiarity of the idea of the modern state is that it is the embodiment of freedom, not according to subjective liking, but to the conception of the will, the will, that is, in its universal and divine character. Incomplete states are they, in which this idea is still only a germ, whose particular phases are not permitted to mature into self dependence. In the republics of classical antiquity universality, it is true, is to be found. But in those ages particularity had not as yet been released from its fetters, and led back to universality or the universal purpose of the whole. The essence of the modern state binds together the universal and the full freedom of particularity, including the welfare of

individuals. It insists that the interests of the family and civic community shall link themselves to the state, and yet is aware that the universal purpose can make no advance without the private knowledge and will of a particularity, which must adhere to its right. The universal must be actively furthered, but, on the other side, subjectivity must be wholly and vitally developed. Only when both elements are present in force is the state to be regarded as articulate and truly organized.

261. In contrast with the spheres of private right and private good, of the family and of the civic community, the state is on one of its sides an external necessity. It is thus a higher authority, in regard to which the laws and interests of the family and community are subject and dependent. On the other side, however, the state is the indwelling end of these things, and is strong in its union of the universal end with the particular interests of individuals. Thus, just so far as people have duties to fulfil towards it, they have also rights (§155). Note. We have already noticed (§3, note) that Montesquieu in his famous work, "The Spirit of the Laws," has kept before his mind, and sought to prove in detail, the thought that the laws, especially those of private right, are dependent upon the character of the state. He has maintained the philosophic view that the part is to be regarded only in relation to the whole. Duty is, in the first instance, a relation to something, which is for me a substantial and self- subsisting universal. Right, on the other hand, is in general some embodiment of this substantive reality, and hence brings to the front its particular side and my particular freedom. These two things, treated formally, appear as deputed to different phases or persons. But the state as ethical, implying thorough interpenetration of the substantive and the particular, brings into light the fact that my obligation to the substantive reality is at the same time the realization of my particular freedom. In the state, duty and right are bound together in one and the same reference. But because in the state the elements of right and duty attain their

peculiar shape and reality, the difference between them once more becomes manifest. While they are identical in themselves or formally, they differ in content. In private right and morals the necessity inherent in the relation fails to be realized. The abstract equality of content is alone brought forward. In this abstract region what is right for one is right for another, and what is one man's duty is also another man's duty. This absolute identity of right and duty occurs, when transferred to the content, simply as equality. This content, which is now to rank as the complete universal and sole principle of duty and right, is the personal freedom of men. Hence, slaves have no duties, because they have no rights, and vice versa, religious duties, of course, falling outside of this discussion. But when we turn from abstract identity to the concrete idea, the idea which develops itself within itself, right and duty are distinguished, and at once become different in content. In the family, for example, the rights of the son are not the same in content as his duties towards his father, nor are the rights of the citizen the same in content as his duties to his prince or government. The conception of the union of duty and right is one of the most important features of states, and to it is due their internal strength. — The abstract treatment of duty insists upon casting aside and banishing the particular interest as something unessential and even unworthy. But the concrete method, or the idea, exhibits particularity as essential, and the satisfaction of the particular as a sheer necessity. In carrying out his duty the individual must in some way or other discover his own interest, his own satisfaction and recompense. A right must accrue to him out of his relation to the state, and by this right the universal concern becomes his own private concern. The particular interest shall in truth be neither set aside nor suppressed, but be placed in open concord with the universal. In this concord both particular and universal are inclosed. The individual, who from the point of view of his duties is a subject, finds, in fulfilling his civic duties, protection of person and

property, satisfaction of his real self, and the consciousness and self-respect implied in his being a member of this whole. Since the citizen discharges his duty as a performance and business for the state, the state is permanently preserved. Viewed from the plane of abstraction, on the other hand, the interest of the universal would be satisfied, if the contracts and business, which it demands of him, are by him fulfilled simply as duties. Addition. Everything depends on the union of universality and particularity in the state. In the ancient states the subjective end was out-and-out one with the volition of the state. In modern times, on the contrary, we demand an individual view, and individual will and conscience. Of these things the ancients had none in the same sense. For them the final thing was the will of the state. While in Asiatic despotisms the individual had no inner nature, and no self-justification, in the modern world man's inner self is honoured. The conjunction of duty and right has the twofold aspect that what the state demands as duty should forthwith be the right of individuality, since the state's demand is nothing other than the organization of the conception of freedom The prevailing characters of the individual will are by the state brought into objective reality, and in this way first attain to their truth and realization. The state is the sole and essential condition of the attainment of the particular end and good.

262. The actual idea, the spirit, divides itself, as we have said, into the two ideal spheres of its conception, the family and the civic community. It descends into its two ideal and finite spheres, that it may out of them become actually infinite and real. Hence, spirit distributes to individuals as a mass the material of its finite realization in these spheres, in such a way that the portion of the individual has the appearance of being occasioned by his circumstances, caprice, and private choice (§185, and note). Addition. In the Platonic state subjective freedom has not as yet any place, since in it the rulers assigned to individuals their occupations. In many oriental states

occupation depends upon birth. But subjective freedom, which must be respected, demands free choice for individuals.

263. In these two spheres, in which the elements of spirit, individuality, and particularity, have in one their direct and in the other their reflected reality, spirit is their objective universality in the form of appearance. It is the power of the rational in the region of necessity (§184), and becomes the institutions, which have already been passed in review. Addition. The state, as spirit, divides itself according to the particular determining attributes of its conception, in order to exist in its own way. "We may adduce an illustration out of the region of nature. The nerve-system is especially the sensitive system; it is the abstract element which aims, so to speak, to exist by itself, and in this existence to have its own identity. Now feeling, when analyzed, furnishes two separate sides, dividing itself so that the differences appear as complete systems. On one side is the abstract sense of feeling, which withdraws by itself; it is the smothered movement going on internally in reproduction, internal self-nourishment, assimilation, and digestion. On the other hand this withdrawal into oneself has over against itself the element of difference, or the movement outwards; and this outward movement of feeling is irritability. These two form a system of their own, and there are lower orders of animals, in which this system alone is developed, being without that unity of feeling which marks the complete soul. If we compare these facts of nature with the facts of spirit, we may place together family and sensibility on the one side, civic community and irritability on the other. The third is the state, corresponding to the actual nervous system as an internally organized whole. But it is a living unity only in so far as both elements, the family and the civic community, are developed within it. The laws which govern these two are the institutions of the rational; it makes its appearance in them. The foundation and final truth of these institutions is the spirit, which is their universal purpose and

conscious object. The family is, indeed, also ethical, but its purpose is not a conscious one. In the civic community, on the other hand, separation is the definitive feature.

264. The individuals of a multitude are spiritual beings, and have a twofold character. In them is the extreme of the independently conscious and willing individuality, and also the extreme of the universality, which knows and wills what is substantive. They obtain the rights of both these aspects, only in so far as they themselves are actual, both as private persons and as persons substantive. One right they have directly in the family, the other in the civic community. In these two institutions, which implicitly universalize all particular interests, individuals have their real self-conscious existence. And in the corporation they provide for these particular interests a wider scope, and an activity directed to a universal end.

265. These institutions comprise in detail the constitution, that is, the developed and actualized rationality. They are the steadfast basis of the state, determining the temper of individuals towards the state, and their confidence in it. They are, moreover, the foundation- stones of public freedom, because in them particular freedom, becomes realized in a rational form. They thus involve an intrinsic union of freedom and necessity. Addition. It has been already remarked that both the sanctity of marriage, and also the institutions, in which the ethical character of the civic community makes its appearance, constitute the stability of the whole. The universal is the concern of every particular person. Everything depends on the law of reason being thoroughly incorporated with the law of particular freedom. My particular end thus becomes identical with the universal. In any other case the state is a mere castle in the air. In the general self-consciousness of individuals the state is actual, and in the identity of particularity and universality it has its stability. It has often been said that

the end of the state is the happiness of the citizens. That is indeed true. If it is not well with them, if their subjective aim is not satisfied, if they find that the state as such is not the medium through which comes their satisfaction, the state stands upon an insecure footing.

266. But spirit is realized and becomes its own object, not only as this necessity and as a kingdom of appearances, but as their ideality or inner being. Substantive universality is thus an object and end for itself, and necessity assumes the form of freedom.

267. By the necessity, which lies within this ideality, is meant the development of the idea within itself. As subjective substantiality the idea is a political temper of mind, and in distinction from this it, as objective, is the organism of the state, i.e., the strictly political state, and its constitution. Addition. The unity of the freedom, which knows and wills itself, exists in the first instance as necessity. Here the substantive is found as the subjective existence of individuals. But there is a second necessity, and that is the organism. In this case spirit is a process within itself, makes within itself distinctions, divides itself into organic members, through which it passes in living circulation.

268. Political disposition, or, in general terms, patriotism, may be defined as the assurance which stands on truth, and the will which has become a custom. Mere subjective assurance does not proceed out of truth, and is only opinion. Genuine patriotism is simply a result of the institutions which subsist in the state as in the actuality of reason. Hence, patriotic feeling is operative in the act, which is in accord with these institutions. Political sentiment is, in general, a confidence, which may pass over into a more or less intelligent insight; it is a consciousness that ray substantive and particular interest is contained and preserved in the interest and end of another, here the state, in its relation to me, the individual. Wherefore the state is for me forthwith not another, and I in this consciousness am free.

Note. By patriotic feeling is frequently understood merely a readiness to submit to exceptional sacrifices or do exceptional acts. But in reality it is the sentiment which arises in ordinary circumstances and ways of life, and is wont to regard the commonweal as its substantive basis and end. This consciousness is kept intact in the routine of life, and upon it the readiness to submit to exceptional effort is based. But as men would rather be magnanimous than merely right, they easily persuade themselves that they possess this extraordinary patriotism, in order to spare themselves the burden of the true sentiment, and to excuse the lack of it. If this feeling be regarded as something, which provides its own beginning, and can proceed out of subjective imaginations and thoughts, it is con. founded with mere opinion, and in that case is devoid of its true basis in objective reality. Addition. Uneducated men delight in surface-reasonings and faultfindings. Fault-finding is an easy matter but hard is it to know the good and its inner necessity. Education always begins with fault-finding, but when full and complete sees in everything the positive. In the case of religion one may say off-hand that this or that is superstition, but it is infinitely harder to conceive of the truth involved in it. Political sentiment, as a mere appearance, is also to be distinguished from what men truly will. They will in fact the real matter, but they holdfast to bits, and delight in the vanity of making improvements. Men trust in the stability of the state, and suppose that in it only the particular interest can come into being. But. custom makes invisible that upon which our whole existence turns. If any one goes safe through the streets at night, it does not occur to him that it could be otherwise. The habit of feeling secure has become a second nature, and we do not reflect that it is first brought about by the agency of special institutions. Often it is imagined that force holds the state together, but the binding cord is nothing else than the deep-seated feeling of order, which is possessed by all.

269. Political disposition is given definite content by the different phases of the organism of the state. This organism is the development of the idea into its differences, which are objectively actualized. These differences are the different functions, affairs, and activities of state. By means of them the universal uninterruptedly produces itself, by a process which is a necessary one, since these various offices proceed from the nature of the conception, The universal is, however, none the less self-contained, since it is already presupposed in its own productive process. This organism is the political constitution. Addition. The state is an organism or the development of the idea into its differences. These different sides are the different functions, affairs and activities of state by means of which the universal unceasingly produces itself by a necessary process. At the same time it is self-contained, since it is presupposed in its own productive activity. This organism is the political constitution. It proceeds eternally out of the state, just as the state in turn is self-contained by means of the constitution. If these two things fall apart, and make the different aspects independent, the unity produced by the constitution is no longer established. The true relation is illustrated by the fable of the belly and the limbs. Although the parts of an organism do not constitute an identity, yet it is of such a nature that, if one of its parts makes itself independent, all must be harmed. We cannot by means of predicates, propositions, etc., reach any right, estimate of the state, which should be apprehended as an organism. It is much the same with the state as with the nature of God, who cannot be through predicates conceived, whose life rather is within itself and must be perceived.

270. (1) The abstract actuality or substantiality of the state consists in this, that the end pursued by the state is the general interest, which, being the substance of all particular interests, includes the preservation of them also. (2) But the actuality of the state is also the necessity of the state, since it breaks up into the various distinctions of state-activity, which are implied

in the conception. By means of the state's substantiality these distinctions become real and tangible as the different public offices. (3) This substantiality, when thoroughly permeated by education, is the spirit which knows and wills itself. Hence, what the state wills it knows, and knows it in its universality as that which is thought out. The state works and acts in obedience to conscious ends, known principles and laws, which are not merely implied, but expressly before its consciousness. So, too, it works with a definite knowledge of all the actual circumstances and relations, to which the acts refer. Note. We must here touch upon the relation of the state to religion. In modern times it is often repeated that religion is the foundation of the state, and accompanying this assertion is the dogmatic claim that outside of religion nothing remains to political science. Now, no assertion can be more confusing. Indeed, it exalts confusion to the place of an essential element in the constitution of the state, and of a necessary form of knowledge. In the first place it may seem suspicious that religion is principally commended and resorted to in times of public distress, disturbance, and oppression; it is thought to furnish consolation against wrong, and the hope of compensation in the case of loss. A proof of religious feeling is considered to be indifference to worldly affairs and to the course and tenor of actual life. But the state is the spirit, as it abides in the world. To refer people to religion is far from calculated to exalt the interest and business of the state into a really earnest purpose. On the contrary, state concerns are held to be a matter of pure caprice, and are therefore rejected. The ground for this step is that in the state only the purposes of passion and unlawful power prevail, or that religion, when taken by itself, is sufficient to control and decide what is right. It would surely be regarded as a bitter jest if those who were oppressed by any despotism were referred to the consolations of religion; nor is it to be forgotten that religion may assume the form of a galling superstition,

involving the most abject servitude, and the degradation of man below the level of the brute. Amongst the Egyptians and Hindoos animals are revered as higher creatures than man. Such a fact leads us to observe that we cannot speak of religion in general, and that when it assumes certain forms security must be found against it in some power which will guarantee the rights of reason and self-consciousness. But the ultimate judgment upon the connection of religion with the state is obtained only when we go back to their conception. Religion has as its content absolute truth, and, therefore, also the highest kind of feeling. Religion, as intuition, feeling, or imaginative thought, the object of whose activity is God, the unlimited basis and cause of all things, advances the claim that everything should be apprehended in reference to it, and in it should receive its confirmation, justification, and certitude. By this relation state and laws, as well as duties, attain for consciousness to their highest verification and most binding power, since they, as a determinate reality, pass up into and rest upon a higher sphere. (See "Encyclopaedia of the Philosophical Sciences.") For this reason in all the changes and chances of life religion preserves the consciousness of the unchanging and of the highest freedom and contentment.[12 Religion, so interpreted, is the foundation of the ethical system, and contains the nature of the state as the divine will; yet it is only the foundation. This is the point at which state and religion separate. The state is the divine will as a present spirit, which unfolds itself in the actual shape of an organized world. They who adhere to the form of religion, as opposed to the state, conduct themselves like persons who in knowledge think that they are right when they cling to a mere abstract essence and never proceed to reality, or like those who will only the abstract good, and arbitrarily postpone deciding what in fact is good (§140, note). Religion is the relation to the absolute in the form of feeling, imagination, faith; and within its all-embracing circumference everything is merely accidental and

transient. If this form is obstinately maintained to be the only real and valid determination for the state, the state, as an organization developed into stable differences, laws, and regulations, is handed over as booty to feebleness, uncertainty, and disorder. By enveloping everything definite this vague form becomes a subjective principle. In contrast with it, 'the laws, instead of having validity and self-subsistence as the objective and universal, are counted as something merely negative. There result the following practical maxims: "The righteous man is not subject to law; only be pious and you may do what you please; you may yield to your own arbitrary will and passion, and direct those, who suffer harm by your acts, to the comfort and hope of religion, or you may brand them as irreligious." But this negative relation sometimes refuses to remain merely an inner sentiment, and makes itself felt in external reality. There then arises the form of religious fanaticism, which, like political fanaticism, regards all state-management and lawful order as restrictive barriers, and discards them as unsuited to the inner life and infinitude of feeling. It banishes private property, marriage, and the relations and tasks of the civic community, as unworthy of love and of the freedom of feeling. But since in daily walk and action decision must be made, then here, as is always the case with the subjective will, whose subjectivity is aware of itself as absolute (§140), the decision proceeds from subjective picture-thinking, that is, from opinion and arbitrary inclination. In opposition to that kind of truth which wraps itself up in the subjectivity of feeling and imagination, the real truth consists in the tremendous transition of the inner into the outer, of the visions of reason into reality. By this process the whole of world-history has been wrought out, and civilized man has at length won the actuality and the consciousness of a reasonable political life. There are those who, as they say, seek the Lord, and in their untutored opinion assure themselves of possessing all things directly. They make no effort to raise their subjective

experience into a knowledge of the truth and a consciousness of objective right and duty. From such persons can proceed nothing except abomination and folly, and the demolition of all ethical relations. These consequences are inevitable, if religious sentiment holds exclusively to its form, and turns against reality and the truth, which is present in the form of the universal, that is, of the laws. Still, this sentiment may not invade reality. On the contrary, it may retain its merely negative character, thus remaining something internal, suiting itself to the laws and affairs of state, and acquiescing either with sighs or with scorn and wishing. It is not strength, but weakness, which has in our times made religiosity a polemic kind of piety, be it conjoined with a true need, or with nothing but discontented vanity. Instead of moulding one's opinion through study, and subjecting one's will to discipline, and thus exalting it to free obedience, it is much the cheaper plan to take a less arduous course. We renounce all knowledge of objective truth, treasure up a feeling of oppression and pride, and claim to possess beforehand all the holiness requisite for discerning the laws and institutions of state, for prejudging them, and specifying what their nature ought to be. The ground for this behaviour is that everything issues from the pious heart unquestionably and infallibly. Thus, as intentions and assertions go to religion for their support, neither by exposing their shallowness nor their erroneousness is it possible to prevail against them. In so far as religion is of a true sort, not displaying a negative and hostile spirit towards the state, but rather recognizing and supporting it, it has its own special place and station. Public worship consists in acts and doctrine; it needs possessions and property, and likewise individuals devoted to the service of the congregation. Out of this arises between church and state a relation, which it is not difficult to define. It is in the nature of the case that the state fulfils a duty by giving assistance and protection to the religious ends of a congregation. More than that, since to the deepest religious feeling there is

present the state as a whole, it may fairly be demanded by the state that every individual should connect himself with some congregation. Of course, with its special character, depending on inner imaginative thinking, the state cannot interfere. When well organized and strong, the state can afford to be liberal in this matter, and may overlook small details affecting itself. It may even give room within itself to congregations, whose creed prevents them from recognizing any direct duties to it. But this concession must depend upon the numerical strength of the sects in question. The members of these religious bodies the state is content to leave to the laws of the civic community, and to accept a passive fulfilment of their direct duties to it by means of substitutes.13 So far as the ecclesiastical body owns property, performs overt acts of worship, and maintains individuals for this service, it leaves the inner realm and enters that of the world. Hence it places itself directly under the jurisdiction of the state. The oath, ethical observances generally, as well as marriage, all carry with them the inner reconstruction and elevation of that disposition of mind which finds in religion its deepest confirmation. Since ethical relations are essentially relations of actual rationality, the rights of these relations are the first to be maintained in reality, and to them is added ecclesiastical confirmation, simply as their inner and more abstract side. As to other forms of ecclesiastical communion, such as doctrine, the internal is more important than the external. The same is true of overt acts of worship and kindred matters, whose legal side appears as independent, and belongs to the state. The ministers and property of churches, it is true, are exempt from the power and jurisdiction of the state. Churches have also assumed jurisdiction over worldly persons in all matters involving the co-operation of religion, such as divorce and the administration of the oath. In all affairs bearing the aspects of both church and state, the political side, owing to its nature, is ill-defined. This is observable even in relation to acts which are wholly civic

(§234). In so far as individuals, assembling for religious worship, have formed themselves into a congregation or corporation, they come under the supervision of the superior officers of state. Doctrine has its province in conscience, and is founded upon the right of the subjective freedom of self-consciousness. This is the inner region, which as such does not come within the sphere of the state. However, the state also has a doctrine, in which its regulations, and whatever in right, in the constitution, etc., is valid generally, exist essentially in the form of thought, as law. And as the state is not a mechanism, but the reasonable life of self-conscious freedom and the system of the ethical world, so sentiment or feeling for it, and the conscious expression) of this feeling in the form of principles, are an essential element in the actual state. Then, again, the doctrine of the church is not merely the edict of conscience, but in the form of doctrine is rather an outward expression, and that, too, regarding a content, which has the most intimate connection with ethical principles and the laws, and directly concern them. Here also church and state meet either harmoniously or in opposition. The difference between the two realms may be driven by the church to extreme antagonism. It, containing as it does the absolute content of religion, may contemplate the spiritual element and therefore the ethical element also, as its own, and may regard the state as a mere mechanical scaffolding for unspiritual, external ends. It may esteem itself as the kingdom of God or at least as the way to it and its forecourt, and the state as the kingdom of this world, the sphere of the transient and finite. It may count itself as end for itself, and the state as merely a means. United with such a presumptuous attitude is the demand of the church that the state should let it have its own way, and should show to its doctrines unreserved respect, simply because they are doctrines, no matter what the substance of them may be. The reason advanced by the church is that the formation of doctrine is exclusively its function. Just as the church makes this claim on the wide

ground that the spiritual has been entrusted solely to its keeping, science and knowledge generally may occupy a similar position. Like the church, they may fashion themselves into an independent, exclusive organization, and may with even greater justice look upon themselves as filling the place of the church. Hence would be asked for science also independence of the state; the state would be only a means for it, while it would be its own end. In this connection it is unimportant whether the individuals and representatives, who minister to the congregation, have gone the length of secluding themselves, leaving only the congregations at large in subjection to the state, or whether they abide in the state, and withdraw only their church character. This general position, it may first of all be observed, coincides with the view that the state in its fundamentals takes into its protection and care the life, property, and free-will of every person, simply in so far as he does not injure the life, property, and free-will of any other The state is thus considered as answering simply to our needs. The higher spiritual element, absolute truth, is counted as subjective religiosity or theoretical science, and placed outside of the state. The state is merely the laity, and must be absolutely respectful. That which is peculiarly ethical falls beyond its reach. Now it is a matter of history that there have been barbaric times and circumstances, in which all high spiritual matters had their seat in the church, and the state was only a worldly rule of force, lawlessness, and passion. Abstract opposition was then the main principle of actuality (§358). But it is too blind and shallow a proceeding to consider this view as true and in accordance with the idea. The development of the idea has rather demonstrated that the spirit as free and rational is in itself ethical, that the true idea is actualized rationality, and that this rationality exists as the state. From this idea it is quite easy to infer that its ethical truth assumes for the thinking consciousness a content, which is worked up into the form of universality, and is realized as law. The state in general knows

its own ends, recognizes them with a clear consciousness, and busies itself with them in accordance with fundamental principles. As before remarked, religion has truth for its universal object, but this content is merely given, and its fundamental principles are not recognized through thinking and conceptions. Thus the individual is under an obligation, which is grounded upon authority, and the testimony of his own spirit and heart, in which is contained the element of freedom, takes the form of faith and feeling. But it is philosophic insight, which clearly recognizes that church and state are not opposed to each other on the question of truth and rationality, but differ only in form. There were, it is true, and still are, churches, which have nothing more than a form of public worship; but there are others, which, though in them the form of worship is the main thing, have also doctrine and instruction. Whenever the church takes up the point of doctrine, and deals in its teaching with objective thought and the principles of the ethical and rational, it passes over into the province of the state. It pronounces authoritatively upon the ethical and right, upon the law and institutions, and its utterance is believed. In contrast with faith and the authority of the church, in contrast also with the subjective convictions which it requires, the state is that which knows. In its principles the content does not remain in the form of feeling and faith, but belongs to the formed thought. In so far as the self-caused and self-existing content makes its appearance in religion as a particular content, namely, in the form of doctrines peculiar to the church as a religious community, it does not fall within the scope of the state. In Protestantism, it may be said, there are no clergy who are considered to be the sole depositary of church doctrine, because in this form of religion there is no laity. Since ethical and political principles pass over into the realm of religion, and not only are established, but must be established, in reference to religion, the state is thus on the one hand furnished with religious confirmation. On the other hand there remains to

the state the right and the form of self-conscious objective rationality, the right, that is, to maintain objective reason against the assertions, which have their source in the subjective form of truth, no matter what depth of certitude and authority surrounds them. Because the principle of the state's form is universal, and hence essentially the thought, freedom of thought and scientific investigation issue from the state. It was a church that burnt Giordano Bruno, and forced Galileo, who advocated the Copernican system, to recant upon his knees.

Hence science, also, has its place on the side of the state, as it has the same element of form as the state; its end is knowledge, and indeed thought out objective truth and rationality. Thought knowledge may, it is true, fall from science to mere opinion, and from principles to mere reasonings. Applying itself to ethical objects and the organization of the state, it may oppose their fundamental principles. This it may do with something of the same pretentious claims, as the church makes with regard to its peculiar belongings. It may rely upon mere opining, as if it were reason, and upon the right, advanced by subjective self-consciousness, to be in its opinion and conviction free. Already (§140, note) the principle of the subjectivity of knowledge has been examined, and only a single remark need now be added. On the one hand the state may treat with infinite indifference opinion, in so far as it is mere opinion, and has hence a mere subjective content. This opinion, let it plume itself to any extent it pleases, contains no true strength or force. The state is in the position of the painter, who in his work confines himself to the three ground colours, and may treat with indifference the school-wisdom which maintains that there are seven. But there is another side to the question. This opining of bad principles constitutes itself a universal fact and corrodes actuality. It is manifested as the formalism of unconditioned subjectivity, which would adopt as a basis the scientific starting-point, would exalt the state- academies to the

presumptuous level of a church, and would then turn them against the state. In opposition to this proceeding the state must take under its protection objective truth and the principle of the ethical life; and on the other side, in opposition to the church, which claims unlimited and unconditional authority, the state has to uphold as a general thing the formal right of self-consciousness to its own insight, conviction, and thought of what shall be reckoned as objective truth. There may also be mentioned here the unity of state and church, a union which is much canvassed in modern times, and praised as the highest ideal. If the essential unity of these two is the unity of true principles with sentiment, it is also essential that along with this unity should come into specific existence the difference, which is in the form of their consciousness. In an oriental despotism there already exists the so frequently wished for unity of church and state. Yet in it the state is not present, at least not that self-conscious form of it, which is alone worthy of spirit and includes right, free ethical life and organic development. If the state is to have reality as the ethical self-conscious realization of spirit, it must be distinguished front the form of authority and faith. But this distinction arises only in so far as the ecclesiastical side is in itself divided into separate churches. Then only is the state seen to be superior to them, and wins and brings into existence the universality of thought as the principle of its form. To understand this we must know what universality is, not only in itself, but also in its existence. It is far from being a weakness or misfortune for the state that the church has been divided. Only through this division has the state been able to develop its true character, and become a self-conscious, rational, and ethical reality. This division was an event of the happiest augury, telling in behalf of the freedom and rationality of the church, and also in behalf of the freedom and rationality of thought. Addition. The state is real. Its reality consists in its realizing the interest of the whole in particular ends. Actuality is always the unity of universality

and particularity. Universality exists piecemeal in particularity. Each side appears as if self-sufficient, although it is upheld and sustained only in the whole. In so far as this unity is absent, the thing is unrealized, even though existence may be predicated of it. A bad state is one which merely exists. A sick body also exists, but it has no true reality. A hand, which is cut off, still looks like a hand and exists, though it is not real. True reality is necessity. What is real is in itself necessary. Necessity consists in this, that the whole is broken up into the differences contained in the conception. Then, as so broken up, it furnishes a fast and enduring character, not that of the fossil, but of that which in giving itself up always begets itself anew. To the complete state essentially belong consciousness and thought. Hence the state knows what it wills, and knows it as something thought. Since consciousness has its seat only in the state, science has its place also there, and not in the church. In despite of that, much has in modern times been said to the effect that the state has sprung into existence out of religion. The state is the developed spirit, and exhibits its elements in the daylight of consciousness. Owing to the fact that what lies in the idea walks forth into visible being, the state appears to be something finite, whose province is of this world, while religion represents itself as the realm of the infinite. Thus, the state seems to be subordinate, needing, since the finite cannot subsist by itself, the basis of the church. As finite, it is thought to have no verification, and only in and through religion to become holy and appertain to the infinite. But this version of the matter is highly onesided. The state is certainly in its essence of the world and finite, having particular ends and functions. But its being worldly is only one side of it. Only to a perception, which is void of spirit, is the state merely finite.

The state has a vital soul, and this vitalizing power is subjectivity, which both creates distinctions and yet preserves their unity. In the kingdom of religion there are also distinctions and finitudes. God is triune. Thus there

are three determinations, whose unity alone is the spirit. If we would apprehend in a concrete way the divine nature, we do so only through distinctions. In the divine kingdom as in the worldly occur limits, and it is a one-sided view to say that the worldly spirit or the state is merely finite, for reality is nothing irrational. A bad state is indeed purely finite and worldly, but the rational state is in itself infinite. Secondly, it is said that the state must accept its justification from religion. The idea, as present in religion, is spirit in the inner condition of feeling, but this same idea it is which gives itself worldliness in the state, and procures for itself in consciousness and will an outward place and reality. If we say that the state must be grounded on religion, we mean only that the state must rest upon and proceed from rationality. But this sentence can be understood wrongly to mean that when the spirit of man is bound by a religion which is not free, he is most adroitly brought to political obedience. The Christian religion, however, is the religion of freedom. Yet even Christianity may be infected by superstition, and converted into an instrument of bondage. Thus, the doctrine that the state should be founded on religion is perverted, when it is interpreted to mean that individuals must have religion in order that their spirit, enchained by it, may be the more readily oppressed in the state. But if we mean that reverence should be felt for the state as the whole, of which individuals are the branches, this feeling flows most easily from philosophic insight into the nature of the state, although if that insight should be lacking, religious sentiment may lead to the same result. So the state may need religion and faith. It yet remains essentially distinguished from religion in that its commands are a legal duty, it being a matter of indifference in what spirit the duty is performed, while the empire of religion, on the contrary, is the internal. Just as the state, if it were to make such a claim as religion makes, would endanger the right of the inner mind, so the church degenerates into a tyrannical religion, if it acts as a state and imposes punishments. A third

distinction, related to the foregoing, is that the content of religion is and remains veiled; feeling, sensibility, and fancy are the ground on which it is built, and on this ground everything has the form of subjectivity. The state, on the other hand, actualizes itself, and gives its phases a solid reality. If religiosity were to insist upon making itself good within the state, as it is wont to do in its own territory, it would overturn the political organization. Each several distinction has a broad and fair field in the state, while in religion everything is always referred to the totality. If this totality were to seize upon all the political relations, it would be fanaticism. It would be bent upon having the whole in every particular part, and could not accomplish its desire except by the destruction of the particular. Fanaticism will not allow particular differences to have their way. The expression, "The pious are subject to no law," is nothing more than the decree of fanaticism. Piety, when it replaces the state, cannot tolerate that which is definitely constituted and destroys it. A kindred type of mind is shown by him who permits conscience or internality to judge, and does not decide on general grounds. This internality does not in its development proceed to principles, and gives itself no justification. If piety is counted as the reality of the state, all laws are cast to the winds, and subjective feeling legislates. This feeling may be nothing but caprice, and yet this cannot be ascertained except by its acts. But in so far as it becomes acts or commands, it assumes the shape of laws, and is directly opposed to subjective feeling. God, who is the object of this feeling, may also be regarded as a being who determines. But God is the universal idea, and is in feeling the undetermined, which is not mature enough to determine what actually exists in a developed form in the state. The fact that everything in the state is firm and secure is a bulwark against caprice and positive opinion. So religion, as such, ought not to rule.

271. The political constitution is (1) the organization of the state and the process of its organic life in reference to its own self. In this process the

state distinguishes within itself its elements, and unfolds them into self-subsistence. (2) It is a single, exclusive individuality, and as such is related to another. It turns its distinctive features towards foreign states, and in so doing establishes its self-subsisting distinctions within itself in their ideality.

Addition. Just as irritability in the living organism is in one of its phases something internal, belonging to the organism, as such, so here also the reference to foreign states has a bearing upon what is within. The internal state as such is the civil power; the direction outwards is the military power, which, however, has a definite side within the state itself. To balance both phases is one of the chief matters of statesmanship. Sometimes the civil power has been wholly extinguished, and rests only upon the military power, as happened during the time of the Roman emperors and Praetorian Guards. Sometimes, as in modern days, the military power proceeds only out of the civil power, as when all citizens are bound to bear arms.

I. Internal Constitution.

272. THE CONSTITUTION is rational in so far as the active working divisions of the state are in accord with the nature of the conception. This occurs when every one of its functions is in itself the totality, in the sense that it effectually contains the other elements. These elements, too, though expressing the distinctions of the conception, remain strictly within its ideality, and constitute one individual whole. Note. Concerning the constitution, as concerning reason itself, there has in modern times been an endless babble, which has in Germany been more insipid than anywhere else. With us there are those who have persuaded themselves that it is best even at the very threshold of government to understand before all other things what a constitution is. And they think that they have furnished invincible proof that religion and piety should be the basis of all their shallowness. It is small wonder if this prating has made for reasonable mortals the words reason, illumination, right, constitution, liberty, mere empty sounds, and men should have become ashamed to talk about a political constitution. At least as one effect of this superfluity, we may hope to see the conviction becoming general, that a philosophic acquaintance with such topics cannot proceed from mere reasonings, ends, grounds, and utilities, much less from feeling, love, and inspiration, but only out of the conception. It will be a fortunate thing, too, if those who maintain the divine to be inconceivable and an acquaintance with the truth to be wasted effort, were henceforth to refrain from breaking in upon the argument. What of undigested rhetoric and edification they manufacture out of these feelings can at least lay no claim to philosophic notice. Amongst current ideas must be mentioned, in connection with §269, that regarding the necessary

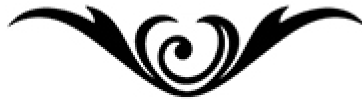
division of the functions of the state. This is a most important feature, which, when taken in its true sense, is rightly regarded as the guarantee of public freedom. But of this those, who think to speak out of inspiration and love, neither know nor will know anything, for in it lies the element of determination through the way of reason. The principle of the separation of functions contains the essential element of difference, that is to say, of real rationality. But as apprehended by the abstract understanding it is false when it leads to the view that these several functions are absolutely independent, and it is onesided when it considers the relation of these functions to one another as negative and mutually limiting. In such a view each function in hostility to or fear of the others acts towards them as towards an evil. Each resolves to oppose the others, effecting by this opposition of forces a general balance, it may be, but not a living unity. But the internal self direction of the conception, and not any other purpose or utility, contains the absolute source of the different functions. On their account alone the political organization exists as intrinsically rational and as the image of eternal reason. From logic, though indeed not of the accepted kind, we know how the conception, and in a concrete way the idea, determine themselves of themselves, and thereby abstractly set up their phases of universality, particularity, and individuality. To take the negative as the point of departure, and set up as primary the willing of evil and consequent mistrust, and then on this supposition cunningly to devise breakwaters, which in turn require other breakwaters to check their activity, any such contrivance is the mark of a thought, which is at the level of the negative understanding, and of a feeling, which is characteristic of the rabble(§244). The functions of the state, the executive and the legislative, as they are called, may be made independent of each other. The state is, then, forthwith overthrown, an occurrence which we have witnessed on a vast scale. Or, in so far as the state is essentially self-contained, the struggle of

one function to bring the other into subjection effects somehow or other a closer unity, and thus preserves only what is in the state essential and fundamental. Addition. In the state we must have nothing which is not an expression of rationality. The state is the world, which the spirit has made for itself. Hence it has a definite self-begun and self- related course. Often we speak of the wisdom of God in nature, but we must not therefore believe that the physical world of nature is higher than the world of spirit. Just so high as the spirit stands above nature, the state stands above the physical life. We must hence honour the state as the divine on earth, and learn that if it is difficult to conceive of nature, it is infinitely harder to apprehend the state. That we in modern times have attained definite views concerning the state in general, and are perpetually engaged in speaking about and manufacturing constitutions, is a fact of much importance. But that does not settle the whole matter. It is necessary further that we approach a reasonable question in the mind of rational beings, that we know what is essential, and distinguish it from what is merely striking. Thus, the functions of the state must indeed be distinguished; and yet each must of itself form a whole, and also contain the other elements. When we speak of the distinctive activity of any function, we must not fall into the egregious error of supposing that it should exist in abstract independence, since it should rather be distinguished merely as an element of the conception. If the distinctions were to subsist in abstract independence, it is as clear as light that two independent things are not able to constitute a unity, but must rather introduce strife. As a result, either the whole world would be cast into disorder, or the unity would be restored by force. Thus, in the French Revolution at one time the legislative function had swallowed up the executive, at another time the executive had usurped the legislative function. It would be stupid in such a case to present the moral claim of harmony, If we cast the responsibility of the matter upon feeling, we have

indeed got rid of the whole trouble. But, necessary as ethical feeling is; it cannot evolve from itself the functions of state. Whence it comes to pass that since the definite functions are the whole implicitly, they comprise in their actual existence the total conception. We usually speak of the three functions of state, the legislative, executive, and judicial. The legislative corresponds to universality, and the executive to particularity; but the judicial is not the third element of the conception. The individuality uniting the other two lies beyond these spheres.

273. The political state is divided into three substantive branches: (a) The power to fix and establish the universal. This is legislation. (b) The power, which brings particular spheres and individual cases under the universal. This is the function of government. (c) The function of the prince, as the subjectivity with which rests the final decision. In this function the other two are brought into an individual unity. It is at once the culmination and beginning of the whole. This is constitutional monarchy. Note. The perfecting of the state into a constitutional monarchy is the work of the modern world, in which the substantive idea has attained the infinite form. This is the descent of the spirit of the world into itself, the free perfection by virtue of which the idea sets loose from itself its own elements, and nothing but its own elements, and makes them totalities; at the same time it holds them within the unity of the conception, in which is found their real rationality. The story of this true erection of the ethical life is the subject matter of universal world-history. The old classification of constitutions into monarchy, aristocracy, and democracy is based upon the substantive unity which has not yet been divided. This unity has no internal distinctions, is not an intrinsically developed organization, and has not attained depth and concrete rationality. From the standpoint of the ancient world the classification is correct, because the unity of the ancient state was a substantive whole, not as yet fully mature and unfolded. The distinctions

predicated of it must hence be external, and refer merely to the number of persons in whom this substantive unity should find an abode. But these various forms of the state, which belong in this way to different wholes, are in constitutional monarchy lowered to their proper place as elements. In monarchy we have a single person, in its executive several, in legislation the multitude. But, as we have said, such merely quantitative distinctions are superficial, and do not account for the conception. Similarly, it is not to the point to speak so much as we do of the democratic or aristocratic element in the monarchy for the phases, described by these terms, just in so far as they occur in a monarchy, are no longer democratic and aristocratic. It is thought by some that the state is a mere abstraction which orders and commands, and that it may be left undecided, or be regarded as a trifle, whether one or several or all stand in the chief place in the state. "All these forms," says Fichte ("Naturrecht," Pt. I., p. 196), "are right, and can produce and preserve universal right, if only there be present an ephorat." The ephorat was invented by Fichte, and defined as a needful counterpoise to the highest power. Such a view springs from a shallow conception of the state. It is true, indeed, that in a primitive condition of society these distinctions have little or no meaning. So Moses, when giving rules to the people in the case of their choosing a king, made no other alteration in the institutions than to command that the king's horses and wives should not be too numerous, or his treasure of gold and silver too large (Deut. xvii. 16, and fol.). Further, it is true that in one sense these three forms are even for the idea a matter of no concern. I mean monarchy in its limited and exclusive signification, in accordance with which it stands by the side of democracy and aristocracy. But such a remark has a meaning the opposite of Fichte's. It would mean that these forms are a matter of indifference, because they collectively are not in accordance with the idea in its rational development (§272); nor can the idea in any one of them attain its right and



actuality. Hence, it is idle to ask which of these forms is to be preferred. We speak of them now as having only an historical interest. Here, as in so many other places, must be recognized the penetrating vision of Montesquieu, who discusses this question in his celebrated description of the principles of these forms of government. But this description we must not misunderstand, if we are to do it justice. He, as is well known, stated that virtue was the principle of democracy. Democracy does in fact rest upon sentiment as upon a form which is merely substantive. And it is still under this form that the rationality of the absolute will exists in democracy. But he goes on to say that England in the seventeenth century proved by a beautiful spectacle that its efforts to found a democracy were unavailing owing to a lack of virtue in the leaders. And he adds that, when in a republic virtue disappears, ambition seizes upon those whose minds are capable of it, and greed seizes upon all, and the state, becoming a general prey, maintains its strength only through the power of some individuals and the extravagance of all. Upon this view it must be remarked that when society becomes civilized, and the powers of particularity are developed and freed, the virtue of the rulers is not enough. Not mere sentiment, but the form of rational law is required, if the whole is to be able to keep itself together, and give to the developed powers of particularity the right to expand positively as well as negatively. Similarly should be set aside the misconception that, since in a democratic republic the sentiment of virtue is the substantive form, it is wanting, or at least unnecessary, in a monarchy; and also the misconception that the legally constituted agencies of a systematized organization are opposed to and incompatible with virtue. Moderation, or the principle of aristocracy, implies the incipient separation of public power and private interest. And yet these two are here in such close contact that aristocracy is always by its very nature on the verge of passing into the severest form of tyranny or anarchy, and so bringing on itself destruction. Witness Roman history.

Montesquieu, by crediting monarchy with the principle of honour, refers, it is clear, not to the patriarchal or any of the ancient monarchies, nor, on the other side, to the monarchy which has developed into an objective constitution, but to a feudal monarchy, in which the relations of political right to lawful private property and the privileges of individuals and corporations are confirmed. Since in this form of constitution state-life depends upon privileged persons, in whose liking is laid a large part of what must be done for the maintenance of the state, the objective element of these transactions is grounded not on duty but on imaginative thought and opinion. Thus, instead of duty it is only honour which keeps the state together. Here it is natural to put a second question: — Who shall frame the constitution? This question seems intelligible at first glance, but on closer examination turns out to be meaningless. It presupposes that no constitution exists, but merely a collection of atomic individuals. How a heap of individuals is to obtain a constitution, whether by its own efforts or by means of others, whether by goodness, thought, or force, must be left to itself to decide, for with a mere mass the conception has nothing to do. If the question, however, takes for granted the existence of an actual constitution, then to make a constitution means only to modify it, the previous existence of the constitution implying that any change must be made constitutionally. But it is strictly essential that the constitution, though it is begotten in time, should not be contemplated as made. It is rather to be thought of as above and beyond what is made, as self begotten and self-centred, as divine and perpetual. Addition. The principle of the modern world as a whole is freedom of subjectivity, the principle that all essential aspects of the spiritual whole should attain their right by self- development. From this standpoint one can hardly raise the idle question, as to which form is the better, monarchy or democracy. We venture to reply simply that the forms of all constitutions of the state are one-sided, if they are not able

to contain the principle of free subjectivity, and do not know how to correspond to completed reason.

274. Spirit is real only in what it knows itself to be. The state, which is the nation's spirit, is the law which permeates all its relations, ethical observances, and the consciousness of its individuals. Hence the constitution of a people depends mainly on the kind and character of its self-consciousness. In it are found both its subjective freedom and the actuality of the constitution. Note. To think of giving to a people a constitution a priori is a whim, overlooking precisely that element which renders a constitution something more than a product of thought. Every nation, therefore, has the constitution which suits it and belongs to it. Addition. The state must in its constitution penetrate all its aspects. Napoleon insisted upon giving to the Spanish a constitution a priori, but the project failed. A constitution is not a mere manufacture, but the work of centuries. It is the idea and the consciousness of what is reasonable, in so far as it is developed in a people. Hence no constitution is merely created. That which Napoleon gave to the Spanish was more rational than what they had before, yet they viewed it as something foreign to them, and rejected it because they were not sufficiently developed. In a constitution a people must embody their sense of right and reproduce their conditions. Otherwise the constitution may exist externally, but it has no significance or truth. Often, indeed, the need of and longing for a better constitution may arise in individuals, but that is different from the whole multitude's being saturated by such a notion. This general conviction comes later. The principle of morality and inner conviction advocated by Socrates came of necessity into being in his day; but time had to elapse before it could reach general self-consciousness.

A. The Function of the Prince.

275. THE FUNCTION of the prince contains of itself the three elements of the totality (§272), (1) the universality of the constitution and the laws; (2) counsel, or reference of the particular to the universal; and (3) the final decision, or the self-determination, into which all else returns and from which it receives the beginning of its actuality. This absolute self-determination, constituting the distinguishing principle of the princely function, as such, must be the first to be considered. Addition. We begin with the princely function or the factor of individuality, because in it the three phases of the state are inter-related as a totality. The I is at once the most individual and the most universal. The individual occurs also in nature, but there reality is equal to nonideality, and its parts exist externally to one another. Hence it is not selfcomplete existence; in it the different individualities subsist side by side. In spirit, on the other hand, all differences exist only as ideal or as a unity. The state as spiritual is the interpretation of all its elements, but individuality is at the same time the soul, the vital and sovereign principle, which embraces all differences.

276. (1) The basal principle of the political state is the substantive unity, which is the ideality of its elements, (a) In this ideality the particular functions and offices of the state are just as much dissolved as retained. Indeed, they are retained only as having no independent authority, but such and so extensive an authority as is yielded them in the idea of the whole. They proceed, therefore, from the power of the state, and are the flexible limbs of the state as of their own simplified self. Addition. This ideality of elements is like the life of an organized body. Life exists in every part. There is but one life in all points, and there is no opposition to it. Any part

separated from it is dead. Such is also the ideality of all individual occupations, functions, and corporations, great as may be their impulse to subsist and do for themselves. It is as in the organism, where the stomach assumes independence, and yet is at the same time superseded and sacrificed by becoming a member of one whole.

277. (b) The particular offices and agencies of the state, being its essential elements, are intimately connected with it. To the individuals, who manage and control them, they are attached in virtue not of their direct personality but of their objective and universal qualities. With particular personality, as such, they are joined only externally and accidentally. The business and functions of the state cannot therefore be private property. Addition. The agencies of the state are attached to individuals, who nevertheless are not authorized to discharge their offices through natural fitness, but by reason of their objective qualification. Capacity, skill, character, belong to the particularity of the individual, who must, however, be adapted to his special business by education and training. An office can, therefore, be neither sold nor bequeathed. Formerly in France seats in parliament were saleable, and this is still the case with any position of officer in the English army below a certain grade. These facts depended, or depend, upon the mediaeval constitution of certain states, and are now gradually vanishing.

278. These two characteristics, namely (b) that the particular offices and functions of the state have independent and firm footing neither in themselves, nor in the particular will of individuals, but (a) ultimately in the unity of the state as in their simple self, constitute the sovereignty of the state. Note. This is sovereignty on its inner side. It has an outer side also, as we shall see. In the older feudal monarchy the state had an outer aspect, but on its inner side not only was the monarch at no time sovereign, but neither was the state. Partly were the several offices and functions of the state and

civic life dispersed in independent corporations and communities (§273, note), while the whole was rather an aggregate than an organism. Partly, too, were these functions the private property of individuals who, when it was proposed that they should act, consulted their own opinion and wish. The idealism, which constitutes sovereignty, is that point of view in accordance with which the so-called parts of an animal organism are not parts but members or organic elements. Their isolation or independent subsistence would be disease. The same principle occurs in the abstract conception of the will (see note to next §) as the negativity, which by referring itself to itself reaches a universality, which definitely moulds itself into individuality (§7). Into this concrete universality all particularity and definiteness are taken up, and receive a new significance. It is the absolute self-determining ground. To apprehend it we must be at home with the conception in its true substance and subjectivity. Because sovereignty is the ideality of all particular powers, it easily gives rise to the common misconception, which takes it to be mere force, empty wilfulness, and a synonym for despotism. But despotism is a condition of lawlessness, in which the particular will, whether of monarch or people (ochlocracy) counts as law, or rather instead of law. Sovereignty, on the contrary, constitutes the element of the ideality of particular spheres and offices, in a condition which is lawful and constitutional. No particular sphere is independent and self-sufficient in its aims and methods of working. It does not immerse itself in its own separate vocation. On the contrary, its aims are led by and dependent upon the aim of the whole, an aim which has been named in general terms and indefinitely the well-being of the state. This ideality is manifested in a twofold way. (1) In times of peace the particular spheres and businesses go their way of satisfying their particular offices and ends. According to mere unconscious necessity self-seeking here veers round to a contribution in behalf of mutual preservation and the preservation of the

whole (§183). But, also, through a direct influence from above is it that these employments are continually brought back and limited by the aim of the whole (see "Function of Government," §289), and led to make direct efforts for its preservation. (2) In circumstances of distress, internal or external, the organism consisting of its particulars, comes together into the simple conception of sovereignty, to which is intrusted the safety of the state, even at the sacrifice of what is at other times justifiable. It is here that idealism attains its peculiar realization (§321).

279. (2) Sovereignty, at first only the universal thought of this ideality, exists merely as a subjectivity assured of itself, and as the abstract and so far groundless self-direction and ultimate decision of the will; by virtue of this quality the state is individual and one. But in the next place subjectivity exists in its truth only as a subject, and personality as a person. In the constitution, which has matured into rational reality, each of the three elements of the conception has its own independent, real, and separate embodiment. Hence, the element which implies absolute decision is not individuality in general but one individual, the monarch. Note. The internal development of a science, whose whole content is deduced out of the simple conception — the only method which is deserving of the name philosophic, — reveals the peculiarity that one and the same conception, here the will, which at the beginning is abstract because it is the beginning, yet contains itself, condenses of itself its own characteristics, and in this way acquires a concrete content. Thus it is fundamental in the personality, which is at first in simple right abstract. It then develops itself through the different forms of subjectivity, and at last in absolute right, the state or the complete, concrete objectivity of the will, attains to the personality of the state and its conscious assurance of itself. This final term gives to all particularities a new form by taking them up into its pure self. It ceases to hesitate between reasons pro and con., and deciding by an "I will," initiates

all action and reality. Personality, further, or subjectivity generally, as infinite and selfreferring, has truth only as a person or independent subject. This independent existence must be one, and the truth which it has is of the most direct or immediate kind. The personality of the state is actualized only as a person, the monarch. Personality expresses the conception as such, while person contains also the actuality of the conception. Hence the conception becomes the idea or truth, only when it receives this additional character. A so-called moral person, a society, congregation, or family, be it as concrete as it may, possesses personality only as an element and abstractly. It has not reached the truth of its existence. But the state is this very totality, in which the moments of the conception gain reality in accordance with their peculiar truth. All these phases of the idea have been already explained, both in their abstract and in their concrete forms, in the course of this treatise. Here, however, they need to be repeated, because we, while easily admitting them piecemeal in their particular forms, do not so readily recognise and apprehend them in their true place as elements of the idea. The conception of monarch offers great difficulty to abstract reasonings and to the reflective methods of the understanding. The understanding never gets beyond isolated determinations, and ascribes merit to mere reasons, or finite points of view and what can be derived from them. Thus the dignity of the monarch is represented as something derivative not only in its form but also in its essential character. But the conception of the monarch is not derivative, but purely self-originated. Akin to this mistaken notion is the idea that the right of the monarch is based upon and receives its unconditional nature from divine authority. The misconceptions that are allied to this idea are well-known; besides, philosophy sets itself the task of conceiving the divine. The phrase "sovereignty of the people," can be used in the sense that a people is in general self-dependent in its foreign relations, and constitutes its own state.

Such are the people of Great Britain, for example. But the people of England, Scotland, Ireland, Venice, Genoa, or Ceylon, have ceased to be a sovereign people, since they no longer have independent princes, and the chief government is not exclusively their own. Further, it may be said that internal sovereignty resides in the people if, as was already pointed out (§§277–278), we speak in general terms, and mean that sovereignty accrues to the whole state. But the sovereignty of the people is usually in modern times opposed to the sovereignty of the monarch. This view of the sovereignty of the people may be traced to a confused idea of what is meant by "the people." The people apart from their monarch, and the common membership necessarily and directly associated with him, is a formless mass. It is no longer a state. In it occur none of the characteristic features of an equipped whole, such as sovereignty, government, law-courts, magistrates, professions, etc., etc. When these elements of an organized national life make their appearance in a people, it ceases to be that undefined abstraction, which is indicated by the mere general notion "people." If by the phrase "sovereignty of the people" is to be understood a republic, or more precisely a democracy, for by a republic we understand various empirical mixtures which do not belong to a philosophic treatise, all that is necessary has already been said (§273, note). There can no longer be any defence of such a notion in contrast with the developed idea. When a people is not a patriarchal tribe, having passed from the primitive condition, which made the forms of aristocracy and democracy possible, and is represented not as in a wilful and unorganized condition, but as a self-developed truly organic totality, in such a people sovereignty is the personality of the whole, and exists, too, in a reality, which is proportionate to the conception, the person of the monarch. The element of the ultimate self-determining decision of will does not appear as an immanent vital element of the actual state in its peculiar reality, so long as the classification

of constitutions into democracy, aristocracy, and monarchy can be made. When this classification prevails we are, as we have said, at the stage of the undeveloped substantive unity, which has not yet reached infinite difference and self-immersion. But even in these incomplete forms of the state the summit must be occupied by an individual. Either he appears in actual fact, as in those monarchies, which are of this type. Or, under aristocratic, or more especially under democratic governments, he appears in the person of statesmen or generals, according to accident and the particular need of the time. Here all overt action and realization have their origin and completion in the unity of the leader's decision. But this subjectivity of decision, confined within a primitive and unalloyed unity of functions, must be accidental in its origin and manifestation, and also on the whole subordinate. Accordingly, a pure and unmixed decision was looked for outside of and beyond this conditional summit, and was found in a fate which pronounced judgment from without. As an element of the idea it had to enter actual existence, but yet it had its root outside of human freedom, and the compass of the state. To this source is to be traced the need of oracles, the daimon of Socrates, the consultation of the entrails of animals, the flight of birds, and their way of eating, etc., methods resorted to on great occasions, when it was necessary to have final judgment upon weighty affairs of state. As mankind had not yet realized the profundity of self-consciousness, or come forth from the pure virginity of the substantive unity into self-conscious existence, they had not yet strength to discover such a judgment within the pale of human existence. In the daimon of Socrates (§138) we can discern the beginning of a change; we can see that the will, formerly set upon an object wholly outside of itself, has begun to transfer itself into itself, and recognize itself within itself. This is the beginning of self-conscious and therefore true freedom. This real freedom of the idea, since it gives its own present self-conscious reality to every one

of the elements of rationality, imparts to the function of consciousness the final self-determining certitude, which in the conception of the will is the cope-stone. But this final self-determination can fall within the sphere of human liberty only in so far as it is assigned to an independent and separate pinnacle, exalted above all that is particular and conditional. Only when so placed, has it a reality in accordance with the conception. Addition. In the organization of the state, that is to say, in constitutional monarchy, we must have before us nothing except the inner necessity of the idea. Every other point of view must disappear. The state must be regarded as a great architectonic building, or the hieroglyph of reason, presenting itself in actuality. Everything referring merely to utility, externality, etc., must be excluded from a philosophic treatment. It is easy for one to grasp the notion that the state is the self-determining and completely sovereign will, whose judgment is final. It is more difficult to apprehend this "I will" as a person. By this is not meant that the monarch can be wilful in his acts. Rather is he bound to the concrete content of the advice of his councillors, and, when the constitution is established, he has often nothing to do but sign his name. But this name is weighty. It is the summit, over which nothing can climb. It may be said that an articulated organization has already existed in the beautiful democracy of Athens. Yet we see that the Greeks extracted the ultimate judgment from quite external phenomena, such as oracles, entrails of sacrificial animals, and the flight of birds, and that to nature they held as to a power, which in these ways made known and gave expression to what was good for mankind. Self- consciousness had at that time not yet

risen to the abstraction of subjectivity, or to the fact that concerning the matter to be judged upon must be spoken a human "I will." This "I will" constitutes the greatest distinction between the ancient and the modern world, and so must have its peculiar niche in the great building of state. It is

to be deplored that this characteristic should be viewed as something merely external, to be set aside or used at pleasure.

280. (3) This ultimate self of the state's will is in this its abstraction an individuality, which is simple and direct. Hence its very conception implies that it is natural. Thus the monarch as a specific individual is abstracted from all other content, and is appointed to the dignity of monarch in a directly natural way, by natural birth. Note. This transition from the conception of pure self-determination to direct existence, and so to simple naturalness, is truly speculative in its nature. A systematic account of it belongs to logic. It is on the whole the same transition which is well-known in the nature of the will. It is the process of translation of a content out of subjectivity, as represented end, into tangible reality (§8). But the peculiar form of the idea and of the transition, here passed in review, is the direct conversion of the Pure self-determination of the will, the simple conception itself, into a specific object, a "this," or natural visible reality, without the intervention of any particular content, such as an end of action. In the so-called ontological proof of the existence of God there is the same conversion of the absolute conception into being. This conversion has constituted the depth of the idea in modern times, although it has been recently pronounced to be inconceivable. On such a theory, since the unity of conception and embodiment is the truth (§23), all knowledge of the truth must be renounced. Although the understanding does not find this unity in its consciousness, and harps upon the separation of the two elements of the truth, it still permits a belief in a unity. But since the current idea of the monarch is regarded as issuing out of the ordinary consciousness, the understanding, with its astute reasonings, holds all the more tenaciously to the principle of separation and its results. It thereupon denies that the element of ultimate decision in the state is absolutely, that is, in the conception of reason, conjoined with direct nature. It maintains, on the

contrary, the merely accidental character of the conjunction of these two, and hence regards as rational their absolute divergence. Finally, from the irrationality of the co-relation of these two phases proceed other consequences, which destroy the idea of the state. Addition. It is often maintained that the position of monarch gives to the affairs of state a haphazard character. It is said that the monarch may be ill-educated, and unworthy to stand at the helm of state, and that it is absurd for such a condition of things to exist under the name of reason. It must be replied that the assumption on which these objections proceed is of no value, since there is here no reference to particularity of character. In a completed organization we have to do with nothing but the extreme of formal decision, and that for this office is needed only a man who says "Yes," and so puts the dot upon the "i." The pinnacle of state must be such that the private character of its occupant shall be of no significance. What beyond this final judgment belongs to the monarch devolves upon particularity, with which we have no concern. There may indeed arise circumstances, in which this particularity alone has prominence, but in that case the state is not yet fully, or else badly constructed. In a well-ordered monarchy only the objective side of law comes to hand, and to this the monarch subjoins merely the subjective "I will."

281. Both elements, the final motiveless self of the will, and the like motiveless existence on the side of nature, indissolubly unite in the idea of that which is beyond the reach of caprice, and constitute the majesty of the monarch. In this unity lies the actualized unity of the state. Only by means of its unmotived directness on both its external and its internal side is the unity taken beyond the possibility of degradation to the wilfulness, ends, and views of particularity. It is thus removed also from the en-feeblement and overthrow of the functions of state and from the struggle of faction against faction around the throne. Note. Right of birth and right of

inheritance constitute the basis of legitimacy, not as regards positive right merely, but likewise in the idea. Through the self-determined or natural succession to the vacant throne all factious disputes are avoided. This has rightly been reckoned as one of the advantages of inheritance. However, it is only a consequence, and to assign it as a motive is to drag majesty down into the sphere of mere reasonings. The character of majesty is unmotived directness, and final self-involved existence. To speak of grounds is to propound as its basis not the idea of the state, which is internal to it, but something external in its nature and alien, such as the thought of the well-being of the state or of the people. By such a method inheritance can indeed be deduced through medii termini; but there might be other medii termini with quite other consequences. And it is only too well known what consequences may be drawn from the well-being of the people (salut du peuple). Hence, philosophy ventures to contemplate majesty only in the medium of thought. Every other method of inquiry, except the speculative method of the infinite self-grounded idea, absolutely annuls the nature of majesty. Freely to elect the monarch is readily taken as the most natural way. It is closely allied to the following shallow thought:— “Because it is the concern and interest of the people which the monarch has to provide for, it must be left to the people to choose whom it will depute to provide for them, and only out of such a commission arises the right of governing.” This view, as well as the idea that the monarch is chief-officer of state, and also the idea of a contract between him and the people, proceed from the will of the multitude, in the form of inclination, opinion, and caprice. These views, as we long ago remarked, first make themselves good, or rather seek to do so, in the civic community. They can make no headway against the principle of the family, still less that of the state, or, in general, the idea of the ethical system. That the election of a monarch is the worst of proceedings may be even by ratiocination detected in the consequences,

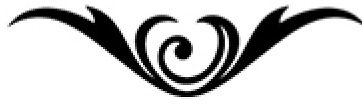
which to it appear only as something possible or probable, but are in fact inevitable. Through the relation involved in free choice the particular will gives the ultimate decision, and the constitution becomes a free-capitulation, that is, the abandonment of the functions of state to the discretion of the particular will. The specific functions of state are thus transformed into private property, and there ensue the enfeeblement and injury of the sovereignty of the state, its internal dissolution and external overthrow. Addition. If we are to apprehend the idea of the monarch, it is not sufficient for us to say that God has established kings, since God has made everything, even the worst of things. Nor can we proceed very far under the guidance of the principle of utility, since it is always open to point out disadvantages. Just as little are we helped by regarding monarchy as positive right. That I should have property is necessary, but this specific possession is accidental. Accidental also appears to be the right that one man should stand at the helm of state, if this right, too, be regarded as abstract and positive. But this right is present absolutely, both as a felt want and as a need of the thing itself. A monarch is not remarkable for bodily strength or intellect, and yet millions permit themselves to be ruled by him. To say that men permit themselves to be governed contrary to their interests, ends, and intentions is preposterous, since men are not so stupid. It is their need and the inner power of the idea which urge them to this in opposition to their seeming consciousness, and retain them in this relation. Although the monarch comes forward as summit and essential factor of the constitution, it must be admitted that in the constitution a conquered people is not identical with the prince. An uprising occurring in a province conquered in war is different from a rebellion in a wellorganized state. The conquered are not rising against their prince, and commit no crime against the state, because they are not joined with their master in the intimate relation of the idea. They do not come within the inner necessity of the

constitution. In that case only a contract is to the fore, and not a state-bond. "Je ne suis pas votre prince, je suis votre maître," replied Napoleon to the delegation from Erfurt.

282. Out of the sovereignty of the monarch flows the right of pardoning criminals. Only to sovereignty belongs that realization of the power of the spirit, which consists in regarding what has happened as not having happened, and cancels crime by forgiving and forgetting. Note. The right of pardon is one of the highest recognitions of the majesty of spirit. This right belongs to the retrospective application of the character of a higher sphere to a lower and antecedent one. Similar applications are found in the special sciences, which treat of objects in their empirical environment (§270, footnote). — It belongs to applications of this kind that injury done to the state generally or to the sovereignty, majesty, and personality of the prince, should fall under the conception of crime, as it has already been discussed (§§95–102), and should indeed be declared to be a specific crime of the gravest character. Addition. Pardon is the remission of punishment, but does not supersede right. Rather right remains, and the pardoned is a criminal as much after the pardon as he was before. Pardon does not imply that no wrong has been committed. Remission of the penalty may occur in religion, for by and in spirit what has occurred can be made not to have occurred. But in so far as remission of penalty is completed in the world, it has place only in majesty, and can be effected only by its unmotived edict.

283. The second element contained in the princely function is that of particularity, involving a definite content and the subsumption of it under the universal. In so far as it receives a particular existence, it is the supreme council, and is composed of individuals. They present to the monarch for his decision the content of the affairs, as they arise, and of the legal cases which necessarily spring out of actual wants. Along with these they furnish also their objective sides, namely, the grounds for decision, the laws which

bear on the case, the circumstances, etc. As the individuals who discharge this office have to do with the monarch's immediate person, their appointment and dismissal lie in his unlimited, free, arbitrary will.



284. The objective side of decision, including knowledge of the special content and circumstances, and the legal and other evidence, is alone responsible. It, that is to say, is alone able to furnish proof of objectivity. It must, therefore, come before a council other than the personal will of the monarch, as such. These councils, advising boards or individual advisers, are alone answerable. The peculiar majesty of the monarch, as the final deciding subjectivity, is exalted above all responsibility for the acts of government.

285. The third element of the princely function concerns the absolutely universal, which consists subjectively in the conscience of the monarch, objectively in the whole constitution and the laws. The princely function presupposes these other elements, just as much as they presuppose it.

286. The objective guarantee of the princely office, or the securing of the lawful succession to the throne by inheritance, lies in the fact that, just as this office has a reality distinct from the other elements determined by reason, so the others have also their independent and peculiar rights and duties. Every member of a rational organism, while preserving itself in independence, preserves also the peculiarities of the others. Note. One of the later results of history is such a modification of the monarchical constitution that the succession to the throne is determined by the law of primogeniture. This is, as it were, a return to the patriarchal principle, out of which this mode of succession has historically arisen, although it now bears the higher form of an absolute pinnacle of an organically developed state. This result has a most significant bearing upon public liberty, and is one of the most important elements in a rational constitution, although, as has already been observed, it is not so generally understood as it is respected.

The earlier and merely feudal monarchies, and despotism also, reveal in their history the alternation of revolutions, high-handed dealings of princes, rebellion, overthrow of princely individuals and houses, and a general desolation and destruction, internal and external. The reason is that their division of state offices, entrusted as they were to vassals, pashas, etc., was only mechanical. It was not a distinction inherent in the essential character and form, but one of merely greater or less power. Accordingly, each part, preserving and producing only itself, did not preserve and produce the rest. All the elements were thus completely, isolated and independent. In the organic relation, in which members, and not parts, are related to one another, each one preserves the rest while fulfilling its own sphere. The preservation of the other members is the substantial end and product of each one in preserving itself. The guarantees asked for, be they for the stability of succession, for the stability of the princely office generally, or for justice and public liberty, are secured in institutions. Love of the people, character, oaths, force, etc., may be regarded as subjective guarantees; but when we speak of a constitution, we are engaged with only objective guarantees, institutions, or organically intertwined and self-conditioned elements. Thus, public freedom and hereditary succession are mutual guarantees, and are absolutely connected. Public liberty is the rational constitution, and hereditary succession of the princely function lies, as has been shown, in the conception of the constitution.

B. The Executive.

287. DECISION IS to be distinguished from its execution and application, and in general from the prosecution and preservation of what has been already resolved, namely, the existing laws, regulations, establishments for common ends, and the like. This business of subsumption or application is undertaken by the executive, including the judiciary and police. It is their duty directly to care for each particular thing in the civic community, and in these private ends make to prevail the universal interest.

288. Common interests of private concern occur within the civic community, and fall outside of the self-constituted and self-contained universal of the state (§256). They are administered in the corporations (§251) of the societies, trades, and professions, by their superintendents and representatives. The affairs, overseen by them, are the private property and interest of these particular spheres, whose authority depends upon the mutual trust of the associates, and confidence in the securities. Yet these circles must be subordinate to the higher interest of the state. Hence, in filling these posts generally, there will occur a mingling of the choice of the interested parties with the ratification of a higher authority.

289. To secure the universal interest of the state and to preserve the law in the province of particular rights, and also to lead these rights back to the universal interest, require the attention of subordinates of the executive. These subordinates are on one side executive officers and on the other a college of advisers. These two meet together in the highest offices of all, which are in contact with the monarch. Note. The civic community is, as we saw, the arena for the contest of the private interests of all against all. It is also the seat of battle between private interest and the collective special

interest, and likewise of both private and collective special interests with the higher standpoint and order of the state. The spirit of the corporation, begotten in the course of regulating the particular spheres, becomes by a process internal to itself converted into the spirit of the state. It finds the state to be the means of preserving particular ends. This is the secret of the patriotism of the citizens in one of its phases. They are aware that the state is their substantive being, because it preserves their particular spheres, sustains their authority, and considers their welfare. Since the spirit of the corporation contains directly the riveting of the particular to the universal, it exhibits the depth and strength of the state as it exists in sentiment. The administration of the business of the corporation through its own representatives is often clumsy, because, while they see and know their own peculiar interests and affairs, they do not discern the connection with remote conditions or the universal standpoint. Other elements contribute to this result, as, e.g., an intimate private relation between the representatives and their subordinates. Circumstances often tend to equalize these two classes which are in many ways mutually dependent. This peculiar territory can be looked on as handed over to the element of formal freedom, in which the knowledge, judgment, and practice of individuals, as also their small passions and fancies, may have room to wrestle with one another. This may all the more easily happen, the more trivial from the universal side of the state is the mismanaged affair, especially when the mismanagement stands of itself in direct relation to the satisfaction and opinion, which are derived from it.

290. In the business of the executive also there is a division of labour (§198). The organized executive officers have therefore a formal though difficult task before them. The lower concrete civil life must be governed from below in a concrete way. And yet the work must be divided into its abstract branches, specially officered by middlemen, whose activity in

connection with those below them must from the lowest to the highest executive offices take the form of a continuous concrete oversight. Addition. The main point which crops up in connection with the executive is the division of offices. This division is concerned with the transition from the universal to the particular and singular; and the business is to be divided according to the different branches. The difficulty is that the different functions, the inferior and superior, must work in harmony. The police and the judiciary proceed each on its own course, it is true, but they yet in some office or other meet again. The means used to effect this conjunction often consists in appointing the chancellor of state and the prime minister, ministers in council. The matter is thus simplified on its upper side. In this way also everything issues from above out of the ministerial power, and business is, as they say, centralized. With this are associated the greatest possible despatch and efficiency in regard to what may affect the universal interests of state. This regime was introduced by the French Revolution, developed by Napoleon, and in France is found to this day. But France, on the other hand, has neither corporations nor communes, that is to say, the sphere in which particular and general interests coincide. In the Middle Ages this sphere had acquired too great an independence. Then there were states within the state, who persisted in behaving as if they were self-subsistent bodies. Though this ought not to occur, yet the peculiar strength of states lies in the communities. Here the government meets vested interests, which must be respected by it. These interests are inspected, and may be assisted by the government. Thus the individual finds protection in the exercise of his rights, and so attaches his particular interest to the preservation of the whole. For some time past the chief task has been that of organization carried on from above: while the lower and bulky part of the whole was readily left more or less unorganized. Yet it is of high importance that it also should be organized, because only as an organism is

it a power or force. Otherwise it is a mere heap or mass of broken bits. An authoritative power is found only in the organic condition of the particular spheres.

291. The offices of the executive are of an objective nature, which is already independently marked out in accordance with their substance (§287). They are at the same time conducted by individuals. Between the objective element and individuals there is no direct, natural connecting tie. Hence individuals are not set aside for these offices by natural personality or by birth. There is required in them the objective element, namely, knowledge and proof of fitness. This proof guarantees to the state what it needs, and, as it is the sole condition, makes it possible for any citizen to devote himself to the universal class.

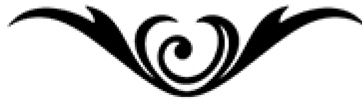
292. The subjective side is found in this, that out of many one individual must be chosen, and empowered to discharge the office. Since in this case the objective element does not lie in genius, as it does in art, the number of persons from whom the selection may be made is necessarily indefinite, and whom finally to prefer is beyond the possibility of absolute determination. The junction of individual and office, two phases whose relation is always accidental, devolves upon the princely power as decisive and sovereign.

293. The particular state-business, which monarchy transfers to executive officers, constitutes the objective side of the sovereignty inherent in the monarch. The distinguishing feature of this state-business is found in the nature of its matter. Just as the activity of the officers is the discharge of a duty, so their office is not subject to chance but a right.

294. The individual, who by the act of the sovereign (§292) is given an official vocation, holds it on the condition that he discharges his duty, which is the substantive factor in his relation. By virtue of this factor the individual finds in his official employment his livelihood and the assured satisfaction of his particularity (§264), and in his external surroundings and

official activity is free from subjective dependence and influences. Note. The state cannot rely upon service which is capricious and voluntary, such, for example, as the administration of justice by knightserrant. This service reserves to itself the right to act in accordance with subjective views, and also the right to withhold itself at will, or to realize subjective ends. The opposite extreme to the knight-errant in reference to public service would be the act of the public servant, who was attached to his employment merely by want, without true duty or right. The public service requires the sacrifice of independent self-satisfaction at one's pleasure, and grants the right of finding satisfaction in the performance of duty, but nowhere else. Here is found the conjunction of universal and particular interests, a union which constitutes the conception and the internal stability of the state (§260). Official position is not based upon contract (§75), although it involves the consent of the two sides and also a double performance. The public servant is not called to a single chance act of service, as is the attorney, but finds in his work the main interest of both his spiritual and his particular existence. So also it is not a matter merely external and particular, the performance of which is intrusted to him. The value of such a matter on its inner side is different from the externality of it, and thus is not as yet injured, as a stipulation is (§77), merely by non- performance. That which the public servant has to perform is as it stands of absolute value. Hence positive injury or non-performance, either being opposed to the essence of service, is a wrong to the universal content (§95, a negative-infinite judgment), and therefore a fault or crime. The assured satisfaction of particular want does away with external need. There is no occasion to seek the means for alleviating want at the cost of official activity and duty. In the universal function of state those who are commissioned with the affairs of state are protected also against the other subjective side, the private passion

of subjects, whose private interests, etc., may be injured by the furtherance of the universal.



295. Security for the state and its subjects against misuse of power by the authorities and their officers is found directly in their responsibility arising out of their nature as a hierarchy. But it is also found in the legitimate societies and corporations. They hold in check the inflow of subjective wilfulness into the power of the officers. They also supplement from below the control from above, which cannot reach down to the conduct of individuals. Note. In the conduct and character of the officers the laws and decisions of government touch individuality, and are given reality. On this depend the satisfaction and confidence of the citizens in the government. On this also depends the execution of the government's intentions, or else the weakening and frustration of them, since the manner in which the intention is realized is by sensibility and sentiment easily estimated more highly than the act itself, even though it be a tax. It is due to this direct and personal contact that the control from above may incompletely attain its end. This end may find an obstacle in the common interest of the official class, which is distinct from both subjects and superiors. Especially when institutions are perhaps not yet perfected, the higher interference of sovereignty for the removal of these hindrances (as for example that of Friedrich II in the famous Müller-Arnold affair) is demanded and justified.

296. Whether or no integrity of conduct, gentleness, and freedom from passion pass into social custom depends upon the nature of the direct ethical life and thought. These phases of character maintain the spiritual balance over against the merely mental acquisition of the so-called sciences, dealing with the objects of these spheres of government, against also the necessary practice of business, and the actual labour of mechanical and other trades. The greatness of the state is also a controlling element, by virtue of which the importance of family relations and other private ties is diminished, and

revenge, hate, and the like passions become inoperative and powerless. In concern for the great interests of a large state, these subjective elements sink out of sight, and there is produced an habitual regard for universal interests and affairs.

297. The members of the executive and the state officials constitute the main part of the middle class, in which are found the educated intelligence and the consciousness of right of the mass of a people. The institutions of sovereignty operating from above and the rights of corporations from below prevent this class from occupying the position of an exclusive aristocracy and using their education and skill wilfully and despotically. Note. At one time the administration of justice, whose object is the peculiar interest of all individuals, had been converted into an instrument of gain and despotism. The knowledge of law was concealed under a pedantic or foreign speech, and the knowledge of legal procedure under an involved formalism. Addition. The state's consciousness and the most conspicuous education are found in the middle class, to which the state officials belong. The members of this class, therefore, form the pillars of the state in regard to rectitude and intelligence. The state, if it has no middle class, is still at a low stage of development. In Russia, for example, there is a multitude of serfs and a host of rulers. It is of great concern to the state that a middle class should be formed, but this can be effected only in an organization such as we have described, namely, by the legalization of particular circles, which are relatively independent, and by a force of officials, whose wilfulness has no power over these legalized circles. Action in accordance with universal right, and the habit of such action, are consequences of the opposition produced by these self-reliant independent circles.

C. The Legislature.

298. THE LEGISLATURE interprets the laws and also those internal affairs of the state whose content is universal. This function is itself a part of the constitution. In it the constitution is presupposed, and so far lies absolutely beyond direct delimitation. Yet it receives development in the improvement of the laws, and the progressive character of the universal affairs of government. Addition. The constitution must unquestionably be the solid ground, on which the legislature stands. Hence, the prime essential is not to set to work to make a constitution. It exists, but yet it radically becomes, that is, it is formed progressively. This progress is an alteration which is not noticed, and has not the form of an alteration. For example, the wealth of princes and their families was at first a private possession in Germany; then, without any struggle or opposition it was converted into domains, that is, state wealth. This came about through the princes feeling the need of an undivided possession and demanding from the country, and the landed classes generally, security for the same. There was in this way developed a kind of possession, over which the princes had no longer the sole disposition. In a similar way, the emperor was formerly judge, and travelled about in his kingdom giving the law. Through the merely seeming or external progress of civilization, it has become necessary that the emperor should more and more delegate this office of judge to others. Thus the judicial function passed from the person of the prince to colleagues. So the progress of any condition of things is a seemingly calm and unnoticed one. In the lapse of time a constitution attains a position quite other than it had before.

299. These objects are defined in reference to individuals more precisely in two ways, (a) what of good comes to individuals to enjoy at the hands of the state, and (b) what they must perform for the state. The first division embraces the laws of private right in general, also the rights of societies and corporations. To these must be added universal institutions, and indirectly (§298) the whole of the constitution. But that which, on the other hand, is to be performed, is reduced to money as the existing universal value of things and services. Hence, it can be determined only in so equitable a way that the particular tasks and services, which the individual can perform, may be effected by his private will. Note. The object-matter of universal legislation may be in general distinguished from that of the administrative and executive functions in this way. Only what is wholly universal in its content falls under legislation, while administration deals with the particular and also the special way of carrying it out. But this distinction is not absolute, since the law, as it is a law, and not a mere general command such as "Thou shalt not kill" (§140, note, p. 142), must be in itself definite, and the more definite it is, the more nearly its content approaches the possibility of being carried out as it is. But at the same time such a complete settlement of the laws would give them an empirical side, which in actual execution would make them subject to alteration. This would be detrimental to their character as laws. The organic unity of the functions of state implies that one single spirit both fixes the nature of the universal and also carries it out to its definite reality. It may occur that the state lays no direct claim upon the many kinds of skill, possessions, talents, faculties, with the manifold personal wealth which is contained in them and is tinged with subjective sentiment, but only upon that form of wealth which appears as money. The services referring to the defence of the state against enemies belong to the duty discussed in the next section of this treatise. Money is, in fact, not a special kind of wealth, but the universal element in all kinds, in so far as

they in production are given such an external reality as can be apprehended as an object. Only at this external point of view is it possible and just to estimate performances quantitatively. Plato in his “Republic” allows the rulers to appoint individuals to their particular class, and assign to them their particular tasks (§185, note). In feudal-monarchy vassals had to perform a similarly unlimited service, and simply in their particularity to discharge such a duty as that of a judge. Services in the East, such as the vast undertakings in architecture in Egypt, are also in quality particular. In all these relations there is lacking the principle of subjective freedom. In accordance with this principle, the substantive act of the individual, which even in the above- mentioned services is in its content particular, should proceed from his particular will. This right is possible only when the demand for work rests upon the basis of universal value. Through the influence of this right the substitution of money for services has been introduced. Addition. The two aspects of the constitution refer to the rights and the services of individuals. The services are now almost all reduced to money. Military duty is perhaps the only remaining personal service. In former times claim was made to the concrete individual, who was summoned to work in accordance with his skill. Now the state buys what it needs. This may seem abstract, dead, and unfeeling. It may also seem as if to be satisfied with abstract services were for the state a retrograde step. But the principle of the modern state involves that everything which the individual does should be occasioned by his will. By means of money the justice implied in equality can be much better substantiated. The talented would be more heavily taxed than the man without talents if respect were had to concrete capacity. But now, out of reverence for subjective liberty, the principle is brought to light that only that shall be laid hold upon which is of a nature to be laid hold upon.

300. In the legislative function in its totality are active both the monarchical element and the executive. The monarchical gives the final decision, and the executive element advises. The executive element has concrete knowledge and oversight of the whole in its many sides and in the actual principles firmly rooted in them. It has also acquaintance with the wants of the offices of state. In the legislature are at last represented the different classes or estates. Addition. It proceeds from a wrong view of the state to exclude the members of the executive from the legislature, as was at one time done by the constituent assembly. In England the ministers are rightly members of parliament, since those who share in the executive should stand in connection with and not in opposition to the legislature. The idea that the functions of government should be independent contains the fundamental error that they should check one another. But this independence is apt to usurp the unity of the state, and unity is above all things to be desired.

301. By admitting the classes the legislature gives not simply implicit but actual existence to matters of general concern. The element of subjective formal freedom, the public consciousness, or the empirical universality of the views and thoughts of the many, here becomes a reality. Note. The expression "The Many" (o*f* polloi) characterizes the empirical universality better than the word "All," which is in current use. Under this "all," children, women, etc., are manifestly not meant to be included. Manifestly, therefore, the definite term "all" should not be employed, when, it may be, some quite indefinite thing is being discussed. There are found in current opinion so unspeakably many perverted and false notions and sayings concerning the people, the constitution, and the classes, that it would be a vain task to specify, explain, and correct them. When it is argued that an assembly of estates is necessary and advantageous, it is meant that the people's deputies, or, indeed, the people itself, must best understand

their own interest, and that it has undoubtedly the truest desire to secure this interest. But it is rather true that the people, in so far as this term signifies a special part of the citizens, does not know what it wills. To know what we will, and further what the absolute will, namely reason, wills, is the fruit of deep knowledge and insight, and is therefore not the property of the people. It requires but little reflection to see that the services performed by the classes in behalf of the general well-being and public liberty cannot be traced to an insight special to these classes. The highest state officials have necessarily deeper and more comprehensive insight into the workings and needs of the state, and also greater skill and wider practical experience. They are able without the classes to secure the best results, just as it is they who must continually do this when the classes are in actual assembly. General well-being does not therefore depend upon the particular insight of the classes, but is rather the achievement of the official deputies. They can inspect the work of the officers who are. farthest removed from the observation of the chief functionaries of state. They, too, have a concrete perception of the more urgent special needs and defects. But to this intelligent oversight must be added the possibility of public censure. This possibility has the effect of calling out the best insight upon public affairs and projects, and also the purest motives; its influence is felt by the members of the classes themselves. As for the conspicuously good will, which is said to be shown by the classes towards the general interest, it has already been remarked (§272, note) that the masses, who in general adopt a negative standpoint, take for granted that the will of the government is evil or but little good. If this assumption were replied to in kind, it would lead to the recrimination that the classes, since they originate in individuality, the private standpoint and particular interests, are apt to pursue these things at the expense of the universal interest; while the other elements of the state, being already at the point of view of the state, are devoted to universal ends.

As for the pledge to respect the public welfare and rational freedom, it should be given especially by the classes, but is shared in by all the other institutions of state. This guarantee is present in such institutions as the sovereignty of the monarch, hereditary succession, and the constitution of the law-courts, much more pronouncedly than in the classes. The classes, therefore, are specially marked out by their containing the subjective element of universal liberty. In them the peculiar insight and peculiar will of the sphere, which in this treatise has been called the civic community, is actualized in relation to the state. It is here as elsewhere by means of the philosophic point of view that this element is discerned to be a mark of the idea when developed to a totality. This inner necessity is not to be confounded with the external necessities and utilities of this phase of state activity. Addition. The attitude of the government to the classes must not be in its essence hostile. The belief in the necessity of this hostile relation is a sad mistake. The government is not one party which stands over against another, in such a way that each is seeking to wrest something from the other. If the state should find itself in such a situation, it must be regarded as a misfortune and not as a sign of health. Further, the taxes, to which the classes give their consent, are not to be looked upon as a gift to the state, but are contributed for the interest of the contributors. The peculiar significance of the classes or estates is this, that through them the state enters into and begins to share in the subjective consciousness of the people.

302. The classes, considered as a mediating organ, stand between the government and the people at large in their several spheres and individual capacities. This specific designation of the classes requires of them a sense and sentiment both for the state and government and for the interests of special circles and individuals. This position of the classes has, in common with the organized executive, a mediatorial function. It neither isolates the

princely function as an extreme, causing it to appear as a mere ruling power acting capriciously, nor does it isolate the particular interests of communities, corporations, and individuals. Furthermore, individuals are not in it contrasted with the organized state, and thus are not presented as a mass or heap, as unorganized opinion and will, or as a mere collective force. Note. It is one of the fundamental principles of logic, that a definite element, which, when standing in opposition, has the bearing of an extreme, ceases to be in opposition and becomes an organic element, when it is observed to be at the same time a mean. In this present question it is all the more important to make prominent this principle, since the prejudice is as common as it is dangerous, which presents the classes as essentially in opposition to the government. Taken organically, that is, in its totality, the element of the classes proves its right only through its office of mediation. Thus the opposition is reduced to mere appearance. If it, in so far as it is manifested, were not concerned merely with the superficial aspect of things but became a substantive opposition, the state would be conceived of as in decay. That the antagonism is not of this radical kind is shown by the fact that the objects, against which it is directed, are not the essential phases of the political organism, but things that are more special and indifferent. The passion, which attaches itself to this opposition, becomes mere party seeking for some subjective interest, perhaps for one of the higher offices of state. Addition. The constitution is essentially a system of mediation. In despotic lands where there are only princes and people, the people act, if they act at all, in such a way as to disturb or destroy the political organization. But when the multitude has an organic relation to the whole, it obtains its interests in a right and orderly way. If this middle term is not present, the utterance of the masses is always violent. Therefore, the despot treats the people with indulgence, while his rage affects only those in his immediate neighbourhood. So also the people in a despotism pay light

taxes, which in a constitutional state become larger through the people's own consciousness. In no other land are taxes so heavy as they are in England.

303. The universal class, the class devoted to the service of the government, has directly in its structure the universal as the end of its essential activity. In that branch of the legislative function, which contains the classes, the private individual attains political significance and efficiency. Hence, private persons cannot appear in the legislature either as a mere undistinguished mass, or as an aggregate of atoms. In fact, they already exist under two distinct aspects. They are found in the class, which is based on the substantive relation, and also in the class based upon particular interests and the labour by which they are secured (§201 and fol.). Only in this way is the actual particular in the state securely attached to the universal. Note. This view makes against another widespread idea, that since the private class is in the legislature exalted to participation in the universal business, it must appear in the form of individuals, be it that representatives are chosen for this purpose, or that every person shall exercise a voice. But even in the family this abstract atomic view is no longer to be found, nor in the civic community, in both of which the individual makes his appearance only as a member of a universal. As to the state, it is essentially an organization, whose members are independent spheres, and in it no phase shall show itself as an unorganized multitude. The many, as individuals, whom we are prone to call the people, are indeed a collective whole, but merely as a multitude or formless mass, whose movement and action would be elemental, void of reason, violent, and terrible. When in reference to the constitution we still hear the people, that is, this unorganized mass, spoken of, we may take it for granted that we shall be given only generalities and warped declamations. The view leading to the disintegration of the common existence found in the various circles,

which are elements in the political world or highest concrete universality, would seek to divide the civic from the political life. The basis of the state would then be only the abstract individuality of wilfulness and opinion, a foundation which is merely accidental, and not absolutely steadfast and authoritative. That would be like building political life in the air. Although in these so-called theories the classes of the civic community generally and the classes in their political significance lie far apart, yet speech has retained their unity, a union which indeed existed long ago.

304. The distinction of classes, which is already present in the earlier spheres, is contained also within the strict circumference of the political classes generally. Their abstract position is the extreme of empirical universality in opposition to the princely or monarchical principle. In this abstract position there is only the possibility of agreement, and hence quite as much the possibility of antagonism. It becomes a reasonable relation, and leads to the conclusion of the syllogism (§302, note), only if its middle term, or element of mediation, becomes a reality. Just as from the side of the princely function the executive (§300) has already this character of reconciliation, so also from the side of the classes should one of their elements be converted into a mediating term.

305. Of the classes of the civic community one contains the principle, which is really capable of filling this political position. This is the class, whose ethical character is natural. As its basis it has family life, and as regards subsistence it has the possession of the soil. As regards its particularity it has a will, which rests upon itself, and, in common with the princely function, it bears the mark of nature.

306. In its political position and significance this class becomes more clearly defined, when its means are made as independent of the wealth of the state as they are of the uncertainty of trade, the desire for gain, and the fluctuations of property. It is secure from the favour at once of the executive

and of the multitude. It is further secured even from its own caprice, since the members of this class, who are called to this office, do without the rights exercised by the other citizens. They do not freely dispose of their property, nor do they divide it equally among their children, whom they love equally. This wealth becomes an inalienable inheritance burdened by primogeniture. Addition. This class has a more independent volition. The class of property owners is divided into two broad parts, the educated and the peasants. In contradistinction to these two kinds stand both the industrial class, which is dependent on and directed by the general wants, and the universal class, which is essentially dependent upon the state. The security and stability of this propertied class may be increased still more by the institution of primogeniture. This, however, is desirable only in reference to the state, since it entails a sacrifice for the political purpose of giving to the eldest son an independent life. Primogeniture is instituted that the state may reckon upon, not the mere possibility belonging to sentiment, but upon something necessary. Now sentiment, it is true, is not bound up with a competence. But it is relatively necessary that some having a sufficient property and being thereby freed from external pressure, should step forth without hindrance and use their activity for the state. But to establish and foster primogeniture where there are no political institutions would be nothing but a fetter clogging the freedom of private right. Unless this freedom is supplemented by the political sense, it goes to meet its dissolution.

307. The right of this part of the substantive class is based upon the nature-principle of the family. But through heavy sacrifices for the state this principle is transformed, and by the transformation this class is set apart for political activity. Hence it is called and entitled to this sphere by birth, without the accident of choice. It thus receives a stable substantive situation intermediate between the subjective caprice and the accidents of the two extremes. While it resembles the princely function (§306), it participates in

the wants and rights of the other extreme. It thus becomes a support at once to the throne and to the community.

308. Under the other part of the general class element is found the fluctuating side of the civic community, which externally because of its numerous membership, and necessarily because of its nature and occupation, takes part in legislation only through deputies. If the civic community appoints these deputies, it does so in accordance with its real nature. It is not a number of atoms gathering together merely for a particular and momentary act without any further bond of union, but a body systematically composed of constituted societies, communities, and corporations. These various circles receive in this way political unity. Through the just claim of this part to be represented by a deputation to be summoned by the princely power, and also through the claim of the first part to make an appearance (§307), the existence of the classes and of their assembly finds its peculiar constitutional guarantee. Note. It is held that all should share individually in the counsels and decisions regarding the general affairs of state. The reason assigned is that all are members of the state, its affairs are the affairs of all, and for the transaction of these affairs all with their knowledge and will have a right to be present. This is a notion which, although it has no reasonable form, the democratic element would insert into the organism of state, notwithstanding the fact that the state is an organism only because of its reasonable form. This superficial view fastens upon and adheres to the abstraction "member of the state." But the rational method, the consciousness of the idea, is concrete and is combined with the true practical sense, which is itself nothing else than the rational sense or the sense for the idea. Yet this sense is not to be confounded with mere business routine, or bounded by the horizon of a limited sphere. The concrete state is the whole, articulated into its particular circles, and the member of the state is the member of a circle or class. Only his objective

character can be recognized in the state. His general character contains the twofold element, private person and thinking person, and thinking is the consciousness and willing of the universal. But consciousness and will cease to be empty only when they are filled with particularity, and by particularity is meant the characteristic of a particular class. The individual is species, let us say, but has his intrinsic general actuality in the species next above it. He attains actual and vital contact with the universal in the sphere of the corporations and societies (§251). It remains open to him by means of his skill to make his way into any class, for which he has the capacity, including the universal class. Another assumption, found in the current idea that all should have a share in the business of state, is that all understand this business. This is as absurd as it, despite its absurdity, is widespread. However, through the channel of public opinion (§316) every one is free to express and make good his subjective opinion concerning the universal.

309. Counsels and decisions upon universal concerns require delegates, who are chosen under the belief that they have a better understanding of state business than the electors themselves. They are trusted to prosecute not the particular interest of a community or a corporation in opposition to the universal, but the universal only. Hence, to the deputies are not committed specific mandates or explicit instructions. But just as little has the assembly the character merely of a lively gathering of persons, each of whom is bent upon instructing, convincing, and advising the rest. Addition. In the case of representation consent is not given directly by all, but by those who are qualified, since here the individual voter is no longer a mere infinite person. Representation is based upon confidence; but confidence is different from simply casting a vote. To be guided by the majority of votes is antagonistic to the principle that I must meet my duty as a particular person. We have confidence in a person when we believe in his insight and

his willingness to treat my affair as his own according to the best light of his knowledge and conscience. The principle of the individual subjective will also disappears, for confidence is concerned with a thing, the guiding ideals of a man, his behaviour, his acts, his concrete understanding. A representative must have a character, insight, and will capable of participating in universal business. He speaks not in his character as an abstract individual, but as one who seeks to make good his interests in an assembly occupied with the universal. And the electors merely ask for some guarantee that the delegate shall carry out and further this universal.

310. Independent means has its right in the first part of the classes. The guarantee implied in a qualification and sentiment adequate to public ends is found in the second part, which arises out of the fluctuating, variable element of the civic community. It is chiefly found in sentiment, skill, and practical knowledge of the interests of the state and civic community, all of which qualities are acquired through actual conduct of business in the magistracies and public offices, and are preserved by practical use. It is found present, too, in the official or political sense, which is fashioned and tested by actual experience. Note. Subjective opinion readily finds the demand for guarantees superfluous or injurious, when it is made upon the so-called people. But the state contains the objective as its distinguishing trait, and not subjective opinion with its self-confidence. Individuals can be for the state only what in them is objectively recognizable and approved. Since this second part of the class-element has its root in particular interests and concerns, where accident, change, and caprice have the right to disport themselves, the state must here look the more closely after the objective. The external qualification of a certain property appears, when taken abstractly, a one-sided external extreme, in contrast with the other just as one-sided extreme, namely, the mere subjective confidence and opinion of the electors. Each in its abstraction is distinguished from the concrete

qualifications, indicated in §302, which are required of those who advise concerning the business of state. Nevertheless, in the choice of a magistrate or other officer of a society or an association, a property qualification is rightly made a condition, especially as much of the business is administered without remuneration. This qualification has also direct value in regard to the political business of the classes, if the members receive no salary.

311. Deputies from the civic community should be acquainted with the particular needs and interests of the body which they represent, and also with the special obstacles which ought to be removed. They should therefore be chosen from amongst themselves. Such a delegation is naturally appointed by the different corporations of the civic community (§308) by a simple process, which is not disturbed by abstractions and atomistic notions. Thus they fulfil the point of view of the community directly, and either an election is altogether superfluous, or the play of opinion and caprice is reduced to a minimum. Note. It is a manifest advantage to have amongst the delegates individuals who represent every considerable special branch of the community, such as trade, manufacture, etc. These individuals must be thoroughly acquainted with their branch and belong to it. In the idea of a loose, indefinite election this important circumstance is given over to accident. Every branch, however, has an equal right to be represented. To regard the deputies as representatives has a significance that is organic and rational, only if they are not representatives of mere separate individuals or of a mere multitude, but of one of the essential spheres of the community and of its larger interests. Representation no longer means that one person should take the place of another. Rather is the interest itself actually present in the person of the representative, since he is there in behalf of his own objective nature. Of elections by means of many separate persons it may be observed that there is necessarily little desire to vote, because one vote has so slight an

influence. Even when those who are entitled to vote are told how extremely valuable their privilege is, they do not vote. Hence occurs just the opposite of what is sought. The selection passes into the hands of a few, a single party, or a special accidental interest, which should rather be neutralized.

312. Of the two elements comprised under the classes, each brings into council a particular modification. As one of these elements has within the sphere of the classes the peculiar function of mediation, and that, too, between two things which both exist, it has a separate existence. The assembly of the classes is thus divided into two chambers.

313. By this separation the number of courts is increased, and there is a greater certainty of mature judgment. Moreover, an accidental decision, secured on the spur of the moment by a simple majority of the votes, is rendered much less probable. But these are not the main advantages. There is, besides, smaller opportunity or occasion for direct opposition to arise between the class element and the government. Or in the case when the mediating element is also found on the side of the lower chamber, the insight of this lower house becomes all the stronger, since it in this case appears to be more unpartisan and its opposition to be neutralized.

314. The classes are not the sole investigators of the affairs of state and sole judges of the general interest. Rather do they form merely an addition (§301). Their distinctive trait is that, as they represent the members of the civic community who have no share in the government, it is through their co-operating knowledge, counsel, and judgment that the element of formal freedom attains its right. Besides, a general acquaintance with state affairs is more widely extended through the publicity given to the transactions of the classes.

315. By means of this avenue to knowledge public opinion first attains to true thoughts, and to an insight into the condition and conception of the state and its concerns. It thus first reaches the capacity of judging rationally

concerning them. It learns, besides, to know and esteem the management, talents, virtues, and skill of the different officers of state. While these talents by receiving publicity are given a strong impulse towards development and an honourable field for exhibiting their worth, they are also an antidote for the pride of individuals and of the multitude, and are one of the best means for their education. Addition. To open the proceedings of the assembly of classes to the public is of great educational value, especially for the citizens. By it the people learn most certainly the true nature of their interests. There prevails extensively the idea that everybody knows already what is good for the state, and that this general knowledge is merely given utterance to in a state assembly. But, indeed, the very opposite is the fact. Here, first of all are developed virtues, talents, skill, which have to serve as examples. Indeed, these assemblies may be awkward for the ministers, who must here buckle on their wit and eloquence to resist the attacks of their opponents. Publicity is the greatest opportunity for instruction in the state interests generally. Amongst a people, where publicity is the rule, there is seen quite a different attitude towards the state than in those places where state assemblies are not found or are secret. By the publication of every proceeding, the chambers are first brought into union with the larger general opinion. It is shown that what a man fancies when he is at home with his wife and friends is one thing, and quite another thing what occurs in a great gathering where one clever stroke annihilates the preceding.

316. Formal subjective freedom, implying that individuals as such should have and express their own judgment, opinion, and advice concerning affairs of state, makes its appearance in that aggregate, which is called public opinion. In it what is absolutely universal, substantive, and true is joined with its opposite, the independent, peculiar, and particular opinions of the many. This phase of existence is therefore the actual contradiction of itself; knowledge is appearance, the essential exists directly

as the unessential. Addition. Public opinion is the unorganized means through which what a people wills and thinks is made known. That which is effective in the state must indeed be in organic relation to it; and in the constitution this is the case. But at all times public opinion has been a great power, and it is especially so in our time, when the principle of subjective freedom has such importance and significance. What now shall be confirmed is confirmed no longer through force, and but little through use and wont, but mainly by insight and reasons.

317. Public opinion contains therefore the eternal substantive principles of justice, the true content and result of the whole constitution, of legislation, and of the universal condition in general. It exists in the form of sound human understanding, that is, of an ethical principle which in the shape of prepossessions runs through everything. It contains the true wants and right tendencies of actuality. But when this inner phase comes forth into consciousness, it appears to imaginative thinking in the form of general propositions. It claims to be of interest partly on its own separate account; but it also comes to the assistance of concrete reasoning upon felt wants and upon the events, arrangements, and relations of the state. When this happens, there is brought forward also the whole range of accidental opinion, with its ignorance and perversion, its false knowledge and incorrect judgment. Now, as to the consciousness of what is peculiar in thought and knowledge, with which the present phenomenon has to do, it may be said that the worse an opinion is, the more peculiar and unique it is. The bad is in its content wholly particular and unique; the rational, on the contrary, is the absolutely universal. Yet it is the unique upon which opinion founds its exalted self-esteem. Note. Hence it is not to be regarded merely as a difference in the subjective point of view when it is declared on one side

“Vox populi, vox dei;”

and on the other side (in Ariosto, for example),15

“Che ‘l Volgare ignorante ogn’ un riprenda E parli più di quel che meno intenda;”

both phases are found side by side in public opinion. Since truth and endless error are so directly united in it, either the one or the other is not truly in earnest. It may seem hard to decide which is in earnest; and it would still be hard, even if we were to confine ourselves to the direct expression of public opinion. But since in its inner being public opinion is the substantive, it is truly in earnest only about that. Yet the substantive cannot be extracted from public opinion; it, by its very nature as substantive, can be known only out of itself and on its own account. No matter what passion is expended in support of an opinion, no matter how seriously it is defended or attacked, this is no criterion of its practical validity. Yet least of all would opinion tolerate the idea that its earnestness is not earnest at all. A great mind has publicly raised the question, whether it be permitted to deceive a people. We must answer that a people does not allow itself to be deceived in regard to its substantive basis, or the essence and definite character of its spirit; but in regard to the way in which it knows this, and judges of its acts and phases, it deceives itself. Addition. The principle of the modern world demands that what every man is bound to recognize must seem to him justified. He, moreover, has had a voice in the discussion and decision. If he has given his word and indicated that he is responsible, his subjectivity is satisfied, and he allows many things to go unchallenged. In France freedom of speech has always proved less dangerous than silence. One fears that if a man is silent he will retain his aversion to an object; but reasoning upon it

furnishes a safety-valve and brings satisfaction, while the object, in the meantime, pursues its way unmolested.

318. Public opinion deserves, therefore, to be esteemed and despised; to be despised in its concrete consciousness and expression, to be esteemed in its essential basis. At best, its inner nature makes merely an appearance in its concrete expression, and that, too, in a more or less troubled shape. Since it has not within itself the means of drawing distinctions, nor the capacity to raise its substantive side into definite knowledge, independence of it is the first formal condition of anything great and reasonable, whether in actuality or in science. Of any reasonable end we may be sure that public opinion will ultimately be pleased with it, recognize it, and constitute it one of its prepossessions. Addition. In public opinion all is false and true, but to find out the truth in it is the affair of the great man. He who tells the time what it wills and means, and then brings it to completion, is the great man of the time. In his act the inner significance and essence of the time is actualized. Who does not learn to despise public opinion, which is one thing in one place and another in another, will never produce anything great.

319. The liberty of taking part in state affairs, the pricking impulse to say and to have said one's opinion, is directly secured by police laws and regulations, which, however, hinder and punish the excess of this liberty. Indirect security is based upon the government's strength, which lies mainly in the rationality of its constitution and the stability of its measures, but partly also in the publicity given to the assemblies of the classes. Security is guaranteed by publicity in so far as the assemblies voice the mature and educated insight into the interests of the state, and pass over to others what is less significant, especially if they are disabused of the idea that the utterances of these others are peculiarly important and efficacious. Besides, a broad guarantee is found in the general indifference and contempt, with which shallow and malicious utterances are quickly and effectually visited.

Note. One means of freely and widely participating in public affairs is the press, which, in its more extended range, is superior to speech, although inferior in vivacity. To define the liberty of the press as the liberty to speak and write what one pleases is parallel to the definition of liberty in general, as liberty to do what one pleases. These views belong to the undeveloped crudity and superficiality of fanciful theorizing. Nowhere so much as in this matter does formalism hold its ground so obstinately, and so little permits itself to be influenced by reasons. And this was to be expected, because the object is here the most transient, accidental, and particular in the whole range of opinion, with its infinite variety of content and aspect. Of course, there is no obscurity about a direct summons to steal, murder, or revolt. But, aside from that, much depends on the manner and form of expression. The words may seem to be quite general and undefined, and yet may conceal a perfectly definite significance. Besides, they may have consequences, which are not actually expressed. Indeed, it may even be debated whether these consequences are really in the expression and properly follow from it. This indefiniteness in the form and in the substance does not admit of the laws attaining in this case the precision usually demanded of laws. Since in this field crime, wrong, and injustice have their most particular and subjective shape, the indefiniteness of the wrong causes the sentence also to be completely subjective. Besides, the injury is in this matter sought to be done to and make itself real in the thought, opinion, and will of others. But it thus comes into contact with the freedom of others, upon whom it depends whether the act is actually an injury or not. Hence, the laws are open to criticism because of their indefiniteness. By the skilful use of terms they may be evaded; or, on the other hand, it may be contended that the sentence is merely subjective. It may be maintained further that an expression is not a deed but only an opinion, or thought, or a simple saying. Thus, from the mere subjectivity of content and from the insignificance of a

mere opinion or saying the inference is drawn that these words should pass unpunished. Yet in the same breath there is demanded as great a respect and esteem for that very opinion of mine as for my real mental possession, and for the utterance of that opinion as for the deliberate utterance of a mental possession. The fact remains that injury to the honour of individuals generally, as libel, abuse, disdainful treatment of the government, its officials and officers, especially the person of the prince, contempt for the laws, incitement to civil broil, etc., are all crimes or faults of different magnitudes. The greater indefiniteness of these acts, due to the element in which they find utterance, does not annul their real character. It simply causes the subjective ground, on which the offence is committed, to decide the nature and shape of the reaction. It is this subjective nature of the offence, which in the reaction converts subjectivity and uncertainty into necessity, whether this reaction be mere prevention of crime by the police or specific punishment. Here, as always, formalism relies on isolated aspects, belonging to the external appearance, and seeks by these abstractions of its own creation to reason away the real and concrete nature of the thing. As to the sciences, they, if they are sciences in reality, are not found in the region of opinion and subjective thought, nor does their method of -presentation consist in the adroit use of terms, or allusions, or half uttered, half-concealed opinions, but in the simple, definite, and open expression of the sense and meaning. Hence, the sciences do not come under the category of public opinion (§316). For the rest, the element in which public opinion finds utterance and becomes an overt and tangible act is, as we have already observed, the intelligence, principles, and opinions of others. It is this element which determines the peculiar effect of these acts or the danger of them to individuals, the community or the state (§218), just as a spark, if thrown upon a heap of gunpowder, is much more dangerous than if thrown on the ground, where it goes out and leaves no trace. Hence,

as the right of science finds security in the content of its matter, so also may an uttered wrong find security, or, at least, toleration, in the contempt with which it is received. Offences, which are in strictness punishable at law, may thus partly come under a kind of nemesis. Internal impotence, by opposing itself to the talents and virtues, by which it feels oppressed, comes in this way to itself, and gives self-consciousness to its own nothingness. A more harmless form of nemesis was found amongst the Roman soldiers in the satirical songs directed against their emperors on the triumphal march. Having gone through hard service, and yet failing to secure mention in the list of honours, they sought to get even with the emperor in this jesting way. But even the nemesis which is bad and malevolent is, when treated with scorn, deprived of its effect. Like the public, which to some extent forms a circle for this kind of activity, it is limited to a meaningless delight in others' misfortunes and to a condemnation, which is inherent in itself.

320. There is the subjectivity, which is the dissolution of the established state life. It has its external manifestation in the opinion or reasoning, which, in seeking to make good its own random aims, destroys itself. This subjectivity has its true reality in its opposite, namely, in that subjectivity, which, being identical with the substantive will, and constituting the conception of the princely power, is the ideality of the whole. This higher subjectivity has not as yet received in this treatise its right and visible embodiment. Addition. We have already regarded subjectivity as existing in the monarch, and in that capacity occupying the pinnacle of the state. The other side of subjectivity manifests itself arbitrarily and quite externally in public opinion. The subjectivity of the monarch is in itself abstract, but it should be concrete, and should as concrete be the ideality which diffuses itself over the whole. In the state which is at peace, all branches of the civic life have their subsistence, but this subsistence beside and outside of one

another the branches have only as it issues out of the idea of the whole. This process or idealization of the whole must also have its own manifestation.

II. External Sovereignty.

321. Internal sovereignty (§278) is this ideality in so far as the elements of spirit, and of the state as the embodiment of spirit, are unfolded in their necessity, and subsist as organs of the state. But spirit, involving a reference to itself, which is negative and infinitely free, becomes an independent existence, which has incorporated the subsistent differences, and hence is exclusive. So constituted, the state has an individuality, which exists essentially as an individual, and in the sovereign is a real, direct individual (§279).

322. Individuality, as exclusive and independent existence, appears as a relation to other self- dependent states. The independent existence of the actual spirit finds an embodiment in this general self-dependence, which is, therefore, the first freedom and highest dignity of a people. Note. Those who, out of a desire for a collective whole, which will constitute a more or less self-dependent state, and have its own centre, are willing to abandon their own centre and self- dependence, and form with others a new whole, are ignorant of the nature of a collective whole, and underrate the pride of a people in its independence. The force, which states have on their first appearance in history, is this self-dependence, even though it is quite abstract and has no further internal development. Hence, in its most primitive manifestation, the state has at its head an individual, whether he be patriarch, chief, or what not.

323. In actual reality, this negative reference of the state to itself appears as reference to each other of two independent things, as though the negative were some external thing. This negative reference has, therefore, in its existence the form of an event, involving accidental occurrences coming

from without. But it is in fact its own highest element, its real infinitude, the idealization of all its finite materials. The substance, as the absolute power, is here brought into contrast with all that is individual and particular, such as life, property, the rights of property, or even wider circles, and makes their relative worthlessness a fact for consciousness.

324. The phase, according to which the interest and right of individuals is made a vanishing factor, is at the same time a positive element, forming the basis of their, not accidental and fleeting, but absolute individuality. This relation and the recognition of it constitute their substantial duty. Property and life, not to speak of opinions and the ordinary routine of existence, they must sacrifice, if necessary, in order to preserve the substantive individuality, independence, and sovereignty of the state. Note. It is a very distorted account of the matter when the state, in demanding sacrifices from the citizens, is taken to be simply the civic community, whose object is merely the security of life and property. Security cannot possibly be obtained by the sacrifice of what is to be secured. Herein is to be found the ethical element in war. War is not to be regarded as an absolute evil. It is not a merely external accident, having its accidental ground in the passions of powerful individuals or nations, in acts of injustice, or in anything which ought not to be. Accident befalls that which is by nature accidental, and this fate is a necessity. So from the standpoint of the conception and in philosophy the merely accidental vanishes, because in it, as it is a mere appearance, is recognized its essence, namely, necessity. It is necessary that what is finite, such as life and property, should have its contingent nature exposed, since contingency is inherent in the conception of the finite. This necessity has in one phase of it the form of a force of nature, since all that is finite is mortal and transient. But in the ethical life, that is to say, the state, this force and nature are separated. Necessity becomes in this way exalted to the work of freedom, and becomes a force

which is ethical. What from the standpoint of nature is transient, is now transient because it is willed to be so; and that, which is fundamentally negative, becomes substantive and distinctive individuality in the ethical order. It is often said, for the sake of edification, that war makes short work of the vanity of temporal things. It is the element by which the idealization of what is particular receives its right and becomes an actuality. Moreover, by it, as I have elsewhere expressed it, "finite pursuits are rendered unstable, and the ethical health of peoples is preserved. Just as the movement of the ocean prevents the corruption which would be the result of perpetual calm, so by war people escape the corruption which would be occasioned by a continuous or eternal peace." — The view that this quotation contains merely a philosophical idea, or, as it is sometimes called, a justification of providence, and that actual war needs another kind of justification, will be taken up later. The idealization, which comes to the surface in war, viewed as an accidental foreign relation, is the same as the ideality by virtue of which the internal state functions are organic elements of the whole. This principle is found in history in such a fact as that successful wars have prevented civil broils and strengthened the internal power of the state. So, too, peoples, who have been unwilling or afraid to endure internal sovereignty, have been subjugated by others, and in their struggles for independence have had honour and success small in proportion to their failure to establish within themselves a central political power; their freedom died through their fear of its dying. Moreover, states, which have no guarantee of independence in the strength of their army, states, e.g., that are very small in comparison with their neighbours, have continued to subsist because of their internal constitution, which merely of itself would seem to promise them neither internal repose nor external security. These phenomena are illustrations of our principle drawn from history. Addition. In peace the civic life becomes more and more extended. Each separate

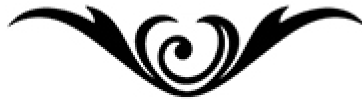
sphere walls itself in and becomes exclusive, and at last there is a stagnation of mankind. Their particularity becomes more and more fixed and ossified. Unity of the body is essential to health, and where the organs become hard death ensues. Everlasting peace is frequently demanded as the ideal towards which mankind must move. Hence, Kant proposed an alliance of princes, which should settle the controversies of states, and the Holy Alliance was probably intended to be an institution of this kind. But the state is individual, and in individuality negation is essentially implied. Although a number of states may make themselves into a family, the union, because it is an individuality, must create an opposition, and so beget an enemy. As a result of war peoples are strengthened, nations, which are involved in civil quarrels, winning repose at home by means of war abroad. It is true that war occasions insecurity of possessions, but this real insecurity is simply a necessary commotion. From the pulpit we hear much regarding the uncertainty, vanity, and instability of temporal things. At the very same time every one, no matter how much he is impressed by these utterances, thinks that he will manage to retain his own stock and store. But if the uncertainty comes in the form of hussars with glistening sabres, and begins to work in downright earnest, this touching edification turns right about face, and hurls curses at the invader. In spite of this, wars arise, when they lie in the nature of the matter. The seeds spring up afresh, and words are silenced before the earnest repetitions of history.

325. Sacrifice for the sake of the individuality of the state is the substantive relation of all the citizens, and is, thus, a universal duty. It is ideality on one of its sides, and stands in contrast to the reality of particular subsistence. Hence it itself becomes a specific relation, and to it is dedicated a class of its own, the class whose virtue is bravery.

326. Dissensions between states may arise out of any one specific side of their relations to each other. Through these dissensions the specific part of

the state devoted to defence receives its distinguishing character. But if the whole state, as such, is in danger of losing its independence, duty summons all the citizens to its defence. If the whole becomes a single force, and is torn from its internal position and goes abroad, defence becomes converted into a war of conquest. Note. The weaponed force of the state constitutes its standing army. The specific function of defending the state must be intrusted to a separate class. This proceeding is due to the same necessity by which each of the other particular elements, interests, or affairs, has a separate place, as in marriage, the industrial class, the business class, and the political class. Theorizing, which wanders up and down with its reasons, goes about to contemplate the greater advantages or the greater disadvantages of a standing army. Mere opinion decides against an army, because the conception of the matter is harder to understand than are separate and external sides. Another reason is that the interests and aims of particularity, expenses, consequent higher taxation, etc., are counted of greater concern by the civic community than is the absolutely necessary. On this view the necessary is valuable only as a means to the preservation of the various special civic interests.

327. Bravery taken by itself is a formal virtue, since in it freedom is farthest removed from all special aims, possessions, and enjoyments, and even from life. But it involves a negation or renunciation of only external realities, and does not carry with it a completion of the spiritual nature. Thus, the sentiment of courage may be based upon any one of a variety of grounds, and its actual result may be not for the brave themselves, bat only for others. Addition. The military class is the class of universality. To it are assigned the defence of the state and the duty of bringing into existence the ideality implicit in itself. In other words it must sacrifice itself. Bravery is, it is true, of different sorts. The courage of the animal, or the robber, the bravery due to a sense of honour, the bravery of chivalry, are not yet the



true forms of it. True bravery in civilized peoples consists in a readiness to offer up oneself in the service of the state, so that the individual counts only as one amongst many. Not personal fearlessness, but the taking of one's place in a universal cause, is the valuable feature of it. In India five hundred men conquered twenty thousand, who were by no means cowardly but lacked the sense of co- operation.

328. The content of bravery as a sentiment is found in the true absolute final end, the sovereignty of the state. Bravery realizes this end, and in so doing gives up personal reality. Hence, in this feeling are found the most rigorous and direct antagonisms. There is present in it a self-sacrifice, which is yet the existence of freedom. In it is found the highest self-control or independence, which yet in its existence submits to the mechanism of an external order and a life of service. An utter obedience or complete abnegation of one's own opinion and reasonings, even an absence of one's own spirit, is coupled with the most intense and comprehensive direct presence of the spirit and of resolution. The most hostile and hence most personal attitude towards individuals is allied with perfect indifference, or even, it may be, a kindly feeling towards them as individuals. Note. To risk one's life is indeed something more than fear of death, but it is yet a mere negative, having no independent character and value. Only the positive element, the aim and content of the act, gives significance to the feeling of fearlessness. Robbers or murderers, having in view a crime, adventurers bent upon gratifying merely their own fancy, risk their lives without fear. The principle of the modern world, that is, the thought and the universal, have given bravery a higher form. It now seems to be mechanical in its expression, being the act not of a particular person, but of a member of the whole. As antagonism is now directed, not against separate persons, but against a hostile whole, personal courage appears as impersonal. To this change is due the invention of the gun; and this by no means chance

invention has transmuted the merely personal form of bravery into the more abstract.

329. The state has a foreign aspect, because it is an individual subject. Hence, its relation to other states falls within the princely function. Upon this function it devolves solely and directly to command the armed force, to entertain relations with other states through ambassadors, to decide upon peace and war, and to conduct other negotiations. Addition. In almost all European countries the individual summit is the princely function, which has charge of foreign affairs. Wherever the constitution requires the existence of classes or estates, it may be asked whether the classes, which in any case control the supplies, should not also resolve upon war and peace. In England, for example, no unpopular war can be waged. But if it is meant that princes and cabinets are more subject to passion than the houses, and hence that the houses should decide whether there should be war or peace, it must be replied, that often whole nations have been roused to a pitch of enthusiasm surpassing that of their princes. Frequently in England the whole people have insisted upon war, and in a certain measure compelled the ministers to wage it. The popularity of Pitt was due to his knowing how to meet what the nation willed. Not till afterwards did calm give rise to the consciousness that the war was utterly useless, and undertaken without adequate means. Moreover, a state is connected not only with another but with several others, and the complications are so delicate that they can be managed only by the highest power.

B. International Law.

330. International law arises out of the relation to one another of independent states. Whatever is absolute in this relation receives the form of a command, because its reality depends upon a distinct sovereign will. Addition. — A state is not a private person, but in itself a completely independent totality. Hence, the relation of states to one another is not merely that of morality and private right. It is often desired that states should be regarded from the standpoint of private right and morality. But the position of private persons is such that they have over them a law court, which realizes what is intrinsically right. A relation between states ought also to be intrinsically right, and in mundane affairs that which is intrinsically right ought to have power. But as against the state there is no power to decide what is intrinsically right and to realize this decision. Hence, we must here remain by the absolute command. States in their relation to one another are independent and look upon the stipulations which they make one with another as provisional.

331. The nation as a state is the spirit substantively realized and directly real. Hence, it is the absolute power on earth. As regards other states it exists in sovereign independence. Hence, to exist for and be recognized by another as such a state is its primary absolute right. But this right is yet only formal, and the state's demand to be recognized, when based on these external relations, is abstract. Whether the state exists absolutely and in concrete fact, depends upon its content, constitution, and condition. Even then the recognition, containing the identity of both inner and outer relations, depends upon the view and will of another. Note. Just as the individual person is not real unless related to others (§71 and elsewhere), so

the state is not really individual unless related to other states (§322), The legitimate province of a state in its foreign relations, and more especially of the princely function, is on one side wholly internal; a state shall not meddle with the internal affairs of another state. Yet, on the other side, it is essential for its completeness that it be recognized by others. But this recognition demands as a guarantee that it shall recognize those who recognize it, and will have respect for their independence. Therefore they cannot be indifferent to its internal affairs. In the case of a nomadic people, or any people occupying a lower grade of civilization, the question arises how far it can be considered as a state. The religious opinions formerly held by Jews and Mahomedans may contain a still higher opposition, which does not permit of the universal identity implied in recognition. Addition. When Napoleon, before the peace of Campoformio, said, "The French Republic needs recognition as little as the sun requires to be recognized," he really indicated the strength of the existence, which already carried with it a guarantee of recognition, without its having been expressed.

332. The direct reality, in which states stand to one another, sunders itself into various relations, whose nature proceeds from independent caprice on both sides, and hence has as a general thing the formal character of a contract. The subject matter of these contracts is, however, of infinitely narrower range than of those in the civic community. There individuals are dependent upon one another in a great variety of ways, while independent states are wholes, which find satisfaction in the main within themselves.

333. International law, or the law which is universal, and is meant to hold absolutely good between states, is to be distinguished from the special content of positive treaties, and has at its basis the proposition that treaties, as they involve the mutual obligations of states, must be kept inviolate. But because the relation of states to one another has sovereignty as its principle, they are so far in a condition of nature one to the other. Their rights have

reality not in a general will, which is constituted as a superior power, but in their particular wills. Accordingly the fundamental proposition of international law remains a good intention, while in the actual situation the relation established by the treaty is being continually shifted or abrogated. Note. There is no judge over states, at most only a referee or mediator, and even the mediatorial function is only an accidental thing, being due to particular wills. Kant's idea was that eternal peace should be secured by an alliance of states. This alliance should settle every dispute, make impossible the resort to arms for a decision, and be recognized by every state. This idea assumes that states are in accord, an agreement which, strengthened though it might be by moral, religious, and other considerations, nevertheless always rested on the private sovereign will, and was therefore liable to be disturbed by the element of contingency.

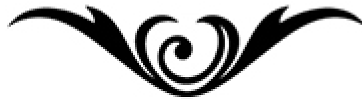
334. Therefore, when the particular wills of states can come to no agreement, the controversy can be settled only by war. Owing to the wide field and the varied relations of the citizens of different states to one another, injuries occur easily and frequently. What of these injuries is to be viewed as a specific breach of a treaty or as a violation of formal recognition and honour remains from the nature of the case indefinite. A state may introduce its infinitude and honour into every one of its separate compartments. It is all the more tempted to make or seek some occasion for a display of irritability, if the individuality within it has been strengthened by long internal rest, and desires an outlet for its pent-up activity.

335. Moreover, the state as a spiritual whole cannot be satisfied merely with taking notice of the fact of an injury, because injury involves a threatened danger arising from the possible action of the other state. Then, too, there is the weighing of probabilities, guesses at intentions, and so forth, all of which have a part in the creation of strife.

336. Each self-dependent state has the standing of a particular will; and it is on this alone that the validity of treaties depends. This particular will of the whole is in its content its well-being, and well-being constitutes the highest law in its relation to another. All the more is this so since the idea of the state involves that the opposition between right or abstract freedom on one side and the complete specific content or wellbeing on the other is superseded. It is to states as concrete wholes that recognition (§331) is first granted.

337. The substantive weal of the state is its weal as a particular state in its definite interests and condition, its peculiar external circumstances, and its particular treaty obligations. Thus the government is a particular wisdom and not universal providence (§324, note). So, too, its end in relation to other states, the principle justifying its wars and treaties, is not a general thought, such as philanthropy, but the actually wronged or threatened weal in its definite particularity. Note. At one time a lengthy discussion was held with regard to the opposition between morals and politics, and the demand was made that politics should be in accordance with morality. Here it may be remarked merely that the commonweal has quite another authority than the weal of the individual, and that the ethical substance or the state has directly its reality or right not in an abstract, but in a concrete existence. This existence, and not one of the many general thoughts held to be moral commands, must be the principle of its conduct. The view that politics in this assumed opposition is presumptively in the wrong depends on a shallow notion both of morality and of the nature of the state in relation to morality.

338. Although in war there prevails force, contingency, and absence of right, states continue to recognize one another as states. In this fact is implied a covenant, by virtue of which each state retains absolute value. Hence, war, even when actively prosecuted, is understood to be temporary,



and in international law is recognized as containing the possibility of peace. Ambassadors, also, are to be respected. War is not to be waged against internal institutions, or the peaceable family and private life, or private persons. Addition. Modern wars are carried on humanely. One person is not set in hate over against another. Personal hostilities occur at most in the case of the pickets. But in the army as an army, enmity is something undetermined, and gives place to the duty which each person owes to another.

339. For the rest, the capture of prisoners in time of war, and in time of peace the concession of rights of private intercourse to the subjects of another state, depend principally upon the ethical observances of nations. In them is embodied that inner universality of behaviour, which is preserved under all relations. Addition. The nations of Europe form a family by virtue of the universal principle of their legislation, their ethical observances, and their civilization. Amongst them international behaviour is ameliorated, while there prevails elsewhere a mutual infliction of evils. The relation of one state to another fluctuates; no judge is present to compose differences; the higher judge is simply the universal and absolute spirit, the spirit of the world.

340. As states are particular, there is manifested in their relation to one another a shifting play of internal particularity of passions, interests, aims, talents, virtues, force, wrong, vice, and external contingency on the very largest scale. In this play even the ethical whole, national independence, is exposed to chance. The spirit of a nation is an existing individual having in particularity its objective actuality and self-consciousness. Because of this particularity it is limited. The destinies and deeds of states in their connection with one another are the visible dialectic of the finite nature of these spirits. Out of this dialectic the universal spirit, the spirit of the world, the unlimited spirit, produces itself. It has the highest right of all, and

exercises its right upon the lower spirits in world-history. The history of the world is the world's court of judgment.

C. World-History.

341. THE UNIVERSAL spirit exists concretely in art in the form of perception and image, in religion in the form of feeling and pictorial imaginative thinking, and in philosophy in the form of pure free thought. In world-history this concrete existence of spirit is the spiritual actuality in the total range of its internality and externality. It is a court of judgment because in its absolute universality the particular, namely, the Penates, the civic community, and the national spirit in their many-coloured reality are all merely ideal. The movement of spirit in this case consists in visibly presenting these spheres as merely ideal.

342. Moreover, world-history is not a court of judgment, whose principle is force, nor is it the abstract and irrational necessity of a blind fate. It is self-caused and self-realized reason, and its actualized existence in spirit is knowledge. Hence, its development issuing solely out of the conception of its freedom is a necessary development of the elements of reason. It is, therefore, an unfolding of the spirit's self-consciousness and freedom. It is the exhibition and actualization of the universal spirit.

343. The history of spirit is its overt deeds, for only what it does it is. and its deed is to make itself as a spirit the object of its consciousness, to explain and lay hold upon itself by reference to itself. To lay hold upon itself is its being and principle, and the completion of this act is at the same time self-renunciation and transition. To express the matter formally, the spirit which again apprehends what has already been grasped and actualized, or, what is the same thing, passes through self renunciation into itself, is the spirit of a higher stage. Note. Here occurs the question of the perfection and education of humanity. They who have argued in favour of this idea, have surmised something of the nature of spirit. They have understood that spirit has Γνῶθι σεαυτὸν as a law of its being, and that when it lays hold upon what it itself is, it assumes a higher form. To those who have rejected this idea, spirit has remained an empty word and history a superficial play of accidental and so-called mere human strife and passion. Though in their use of the words "providence" and "design of providence," they express their belief in a higher control, they do not fill up the notion, but announce that the design of providence is for them unknowable and inconceivable.

344. States, peoples, and individuals are established upon their own particular definite principle, which has systematized reality in their constitutions and in the entire compass of their surroundings. Of this systematized reality they are aware, and in its interests are absorbed. Yet are they the unconscious tools and organs of the world-spirit, through whose inner activity the lower forms pass away. Thus the spirit by its own motion and for its own end makes ready and works out the transition into its next higher stage.

345. Justice and virtue, wrong, force, and crime, talents and their results, small and great passions, innocence and guilt, the splendour of individuals, national life, independence, the fortune and misfortune of states and

individuals, have in the sphere of conscious reality their definite meaning and value, and find in that sphere judgment and their due. This due is, however, as yet incomplete. In world-history, which lies beyond this range of vision, the idea of the world- spirit, in that necessary phase of it which constitutes at any time its actual stage, is given its absolute right. The nation, then really flourishing, attains to happiness and renown, and its deeds receive completion.

346. Since history is the embodiment of spirit in the form of events, that is, of direct natural reality, the stages of development are present as direct natural principles. Because they are natural, they conform to the nature of a multiplicity, and exist one outside the other. Hence, to each nation is to be ascribed a single principle, comprised under its geographical and anthropological existence.

347. To the nation, whose natural principle is one of these stages, is assigned the accomplishment of it through the process characteristic of the self-developing self-consciousness of the world-spirit. In the history of the world this nation is for a given epoch dominant, although it can make an epoch but once (§346). In contrast with the absolute right of this nation to be the bearer of the current phase in the development of the world-spirit, the spirits of other existing nations are void of right, and they, like those whose epochs are gone, count no longer in the history of the world. Note. The special history of a world-historic nation contains the unfolding of its principle from its undeveloped infancy up to the time when, in the full manhood of free ethical self- consciousness, it presses in upon universal history. It contains, moreover, the period of decline and destruction, the rise of a higher principle being marked in it simply as the negative of its own. Hence, the spirit passes over into that higher principle, and thus indicates to world-history another nation. From that time onward the first nation has lost absolute interest, absorbs the higher principle positively, it may be, and

fashions itself in accordance with it, but is, after all, only a recipient, and has no indwelling vitality and freshness. Perhaps it loses its independence, perhaps continues to drag itself on as a particular state or circle of states, and spends itself in various random civil enterprises and foreign broils.

348. At the summit of all actions, including world-historical actions, stand individuals. Each of these individuals is a subjectivity who realizes what is substantive (§279, note). He is a living embodiment of the substantive deed of the world-spirit, and is, therefore, directly identical with this deed. It is concealed even from himself, and is not his object and end (§344). Thus they do not receive honour and thanks for their acts either from their contemporaries (§344), or from the public opinion of posterity. By this opinion they are viewed merely as formal subjectivities, and, as such, are simply given their part in immortal fame.

349. A people is not as yet a state. The transition from the family, horde, clan, or multitude into a state constitutes the formal realization in it of the idea. If the ethical substance, which every people has implicitly, lacks this form, it is without that objectivity which comes from laws and thought-out regulations. It has neither for itself nor for others any universal or generally admitted reality. It will not be recognized. Its independence, being devoid of objective law or secure realized rationality, is formal only and not a sovereignty. Note. From the ordinary point of view we do not call the patriarchal condition a constitution, or a people in this condition a state, or its independence sovereignty. Before the beginning of actual history there are found uninteresting stupid innocence and the bravery arising out of the formal struggle for recognition and out of revenge (§§331, 57, note).

350. It is the absolute right of the idea to come visibly forth, and proceeding from marriage and agriculture (§203, note) realize itself in laws and objective institutions. This is true whether its realization appears in the

form of divine law and beneficence or in the form of force and wrong. This right is the right of heroes to found states.

351. In the same way civilized nations may treat as barbarians the peoples who are behind them in the essential elements of the state. Thus, the rights of mere herdsmen, hunters, and tillers of the soil are inferior, and their independence is merely formal. Note. Wars and contests arising under such circumstances are struggles for recognition in behalf of a certain definite content. It is this feature of them which is significant in world-history.

352. The concrete ideas, which embody the national minds or spirits, has its truth in the concrete idea in its absolute universality. This is the spirit of the world, around whose throne stand the other spirits as perfecters of its actuality, and witnesses and ornaments of its splendour. Since it is, as spirit, only the movement of its activity in order to know itself absolutely, to free its consciousness from mere direct naturalness, and to come to itself, the principles of the different forms of its selfconsciousness, as they appear in the process of liberation, are four. They are the principles of the four world-historic kingdoms.

353. In its first and direct revelation the world-spirit has as its principle the form of the substantive spirit, in whose identity individuality is in its essence submerged and without explicit justification. In the second principle the substantive spirit is aware of itself. Here spirit is the positive content and filling, and is also at the same time the living form, which is in its nature self- referred. The third principle is the retreat into itself of this conscious selfreferred existence. There thus arises an abstract universality, and with it an infinite opposition to objectivity, which is regarded as bereft of spirit. In the fourth principle this opposition of the spirit is overturned in order that spirit may receive into its inner self its truth and concrete essence. It thus becomes at home with objectivity, and the two are reconciled.

Because the spirit has come back to its formal substantive reality by returning out of this infinite opposition, it seeks to produce and know its truth as thought, and as a world of established reality.

354. In accordance with these four principles the four world-historic empires are (1) the Oriental, (2) the Greek, (3) the Roman, and (4) the Germanic.

355. (1) THE ORIENTAL EMPIRE: — The first empire is the substantive world-intuition, which proceeds from the natural whole of patriarchal times. It has no internal divisions. Its worldly government is theocracy, its ruler a high priest or God, its constitution and legislation are at the same time its religion, and its civic and legal regulations are religious and moral commands or usages. In the splendour of this totality the individual personality sinks without rights; external nature is directly divine or an ornament of God, and the history of reality is poetry. The distinctions, which develop themselves in customs, government, and the state, serve instead of laws, being converted by mere social usage into clumsy, diffuse, and superstitious ceremonies, the accidents of personal power and arbitrary rule. The division into classes becomes a caste fixed as the laws of nature. Since in the Oriental empire there is nothing stable, or rather what is firm is petrified, it has life only in a movement, which goes on from the outside, and becomes an elemental violence and desolation. Internal repose is merely a private life, which is sunk in feebleness and lassitude. Note. The element of substantive natural spirituality is present in the first forming of every state, and constitutes the absolute starting point of its history. This assertion is presented and historically established by Dr. Stuhr in his well-reasoned and scholarly treatise “Vom Untergange der Naturstaaten” (Berlin, 1812), who, moreover, suggests in this work a rational method of viewing constitutional history and history in general. The principle of subjectivity and self-conscious freedom he ascribes to the German nation. But since the

treatise is wholly taken up with the decline of the nature-states, it simply leads to the point at which this modern principle makes its appearance. At that time it assumed in part the guise of restless movement, human caprice, and corruption, in part the particular guise of feeling, not having as yet developed itself into the objectivity of self-conscious substantivity or the condition of organized law.

356. (2) THE GREEK EMPIRE: — This empire still contains the earlier substantive unity of the finite and infinite, but only as a mysterious background, suppressed and kept down in gloomy reminiscence, in caves and in traditional imagery. This background under the influence of the self-distinguishing spirit is recreated into individual spirituality, and exalted into the daylight of consciousness, where it is tempered and clarified into beauty and a free and cheerful ethical life. Here arises the principle of personal individuality, although it is not as yet self-centred, but held in its ideal unity. One result of this incompleteness is that the whole is broken up into a number of particular national minds or spirits. Further, the final decision of will is not as yet intrusted to the subjectivity of the independent self-consciousness, but resides in a power, which is higher than, and lies beyond it (§279, note). Moreover, the particularity, which is found in wants, is not yet taken up into freedom, but segregated in a class of slaves.

357. (3) THE ROMAN EMPIRE: — In this empire the distinctions of spirit are carried to the length of an infinite rupture of the ethical life into two extremes, personal private self-consciousness, and abstract universality. The antagonism, arising between the substantive intuition of an aristocracy and the principle of free personality in democratic form, developed on the side of the aristocracy into superstition and the retention of cold self-seeking power, and on the side of the democracy into the corrupt mass. The dissolution of the whole culminates in universal misfortune, ethical life dies, national individualities, having merely the bond of union of a

Pantheon, perish, and individuals are degraded to the level of that equality, in which they are merely private persons and have only formal rights.

358. (4) THE GERMAN EMPIRE: — Owing to the loss of itself and its world, and to the infinite pain caused by it, a loss of which the Jewish people were already held to be the type, spirit is pressed back into itself, and finds itself in the extreme of absolute negativity. But this extreme is the absolute turning-point, and in it spirit finds the infinite and yet positive nature of its own inner being. This new discovery is the unity of the divine and the human. By means of it objective truth is reconciled with freedom, and that, too, inside of self-consciousness and subjectivity. This new basis, infinite and yet positive, it has been charged upon the northern principle of the Germanic nations to bring to completion.

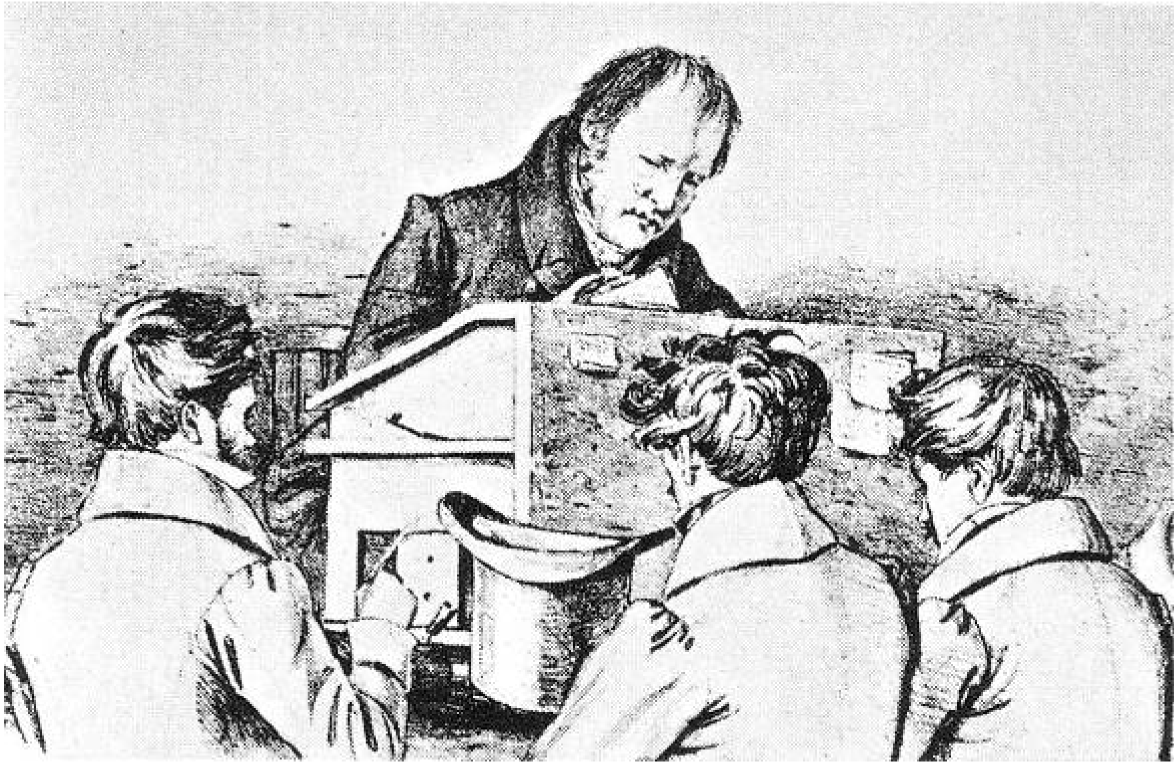
359. The internal aspect of this northern principle exists in feeling as faith, love, and hope. Although it is in this form still abstract, it is the reconciliation and solution of all contradiction. It proceeds to unfold its content in order to raise it to reality and self-conscious rationality. It thus constructs a kingdom of this world, based upon the feeling, trust, and fellowship of free men. This kingdom in this its subjectivity is an actual kingdom of rude caprice and barbarism in contrast with the world beyond. It is an intellectual empire, whose content is indeed the truth of its spirit. But as it is yet not thought out, and still is veiled in the barbarism of picture-thinking, it exists as a spiritual force, which exercises over the actual mind a despotic and tyrannical influence.

360. These kingdoms are based upon the distinction, which has now won the form of absolute antagonism, and yet at the same time are rooted in a single unity and idea. In the obdurate struggle, which thus ensues, the spiritual has to lower its heaven to the level of an earthly and temporal condition, to common worldliness, and to ordinary life and thought. On the other hand the abstract actuality of the worldly is exalted to thought, to the

principle of rational being and knowing, and to the rationality of right and law. As a result of these two tendencies, the contradiction has become a marrowless phantasm. The present has stripped off its barbarism and its lawless caprice, and truth has stripped off its beyond and its casualness. The true atonement and reconciliation has become objective, and unfolds the state as the image and reality of reason. In the state, self-consciousness finds the organic development of its real substantive knowing and will, in religion it finds in the form of ideal essence the feeling and the vision of this its truth, and in science it finds the free conceived knowledge of this truth, seeing it to be one and the same in all its mutually completing manifestations, namely, the state, nature, and the ideal world.

The Philosophy of Fine Art

Translated by F. P. B. Osmaston



Also known under the title *Lectures on Aesthetics*, this book forms a compilation of notes from university lectures on aesthetics, given by Hegel in Heidelberg in 1818 and in Berlin from 1820 to 1829. A posthumous work, *The Philosophy of Fine Art* was compiled in 1835 by his student Heinrich Gustav Hotho, using Hegel's own hand-written notes and other notes made by students during the lectures. Hegel's lectures on Aesthetics are regarded by many as one of the greatest aesthetic theories to have been produced since Aristotle. Hegel's thesis concerning the historical dissolution of art has been the subject of much scholarly debate and influenced important thinkers such as Theodor W. Adorno, Martin Heidegger, György Lukács, Jacques Derrida and Arthur Danto. Heidegger defines Hegel's *Lectures on Aesthetics* "the most comprehensive reflection on the essence of art that the West possesses". Hegel was himself influenced by the works of Johann Joachim Winckelmann, Immanuel Kant, Friedrich Schiller and Friedrich Wilhelm Joseph Schelling.

In the text, Hegel develops his account of art as a mode of absolute spirit that he describes as "the beautiful ideal":

"Now when truth in this its external existence is present to consciousness immediately, and with the concept remains immediately in unity with its external appearance, the Idea is not only true but beautiful. Beauty is determined as the sensible shining of the Idea."

In Parts II and III of the Lectures, Hegel documents the development of art from the paradigmatically symbolic architecture to the paradigmatically classical sculpture to the romantic arts of painting, music and poetry.

Contrary to a once-common belief, Hegel nowhere declares art to be "dead." What he argues, in a representative statement is, "For us art counts no longer as the highest mode in which truth procures existence for itself." He speaks frequently of its "dissolution", but certainly not its end, despite Hotho's use of the latter for the heading of the final moment of the Romantic art form.

Hegel delivering a lecture at the Berlin University in 1828, as depicted in a lithograph by Franz Kugler

CONTENTS

TRANSLATOR'S PREFACE

THE TRANSLATION OF Hegel's "Aesthetik" or "Philosophy of Fine Art," which is contained in the four volumes of the present work, is the first complete translation in English of the three volumes devoted to this subject in the collected edition (Berlin, 1835). I know of four partial translations in English of this work and one in French. These are Mr. W. M. Bryant's translation of Part II[1], Mr. Kedney's short analysis of the entire work[2], Mr. Hastie's translation of Michelet's short "Philosophy of Art[3]," prefaced by Hegel's Introduction, partly translated and partly summarized and lastly Professor B. Bosanquet's complete translation of Hegel's first Introduction with notes[4].

The French translation of M. Bénard purports to be more or less a reproduction of the entire work and runs into two large-sized volumes. It also is, however, so far as Hegel's Introduction and the first two Parts are concerned, merely a compressed summary, and only in particular passages is the translation anything but a very free rendering of the original, though there is a far closer approach to this in Part III.

I have not seen Mr. Bryant's translation. As any approach to an adequate reproduction of Hegel's writing Mr. Hastie's translation of Michelet's work and Mr. Kedney's analysis are of very little value[5]. Professor Bosanquet's translation is admirable within the limits imposed. To that extent I have merely followed, as I was able, in my friend's footsteps; but this advance covers little more than one sixteenth part of the entire work of 1,600 pages.

With regard to all such analyses I entirely concur with Professor Bosanquet's view stated in his preface, that such merely mislead if regarded as in any way a reflex of either Hegel himself or the German text. It is true

that this work is — as are in their degree other volumes of the collected edition, the "Outlines of the Philosophy of Right" for example — a heterogeneous product, in our own instance not merely lacking the final revision of the author, but rather put together as such a connected treatise by the editor responsible (i) from several autograph MSS. of Hegel[6], some of which were little more than fragmentary notes for lectures, (ii) supplemented further from notes[7] taken by pupils who attended such lectures, the entire conglomerate being (iii) finally dovetailed together with connecting links by the editorial hand much as, to cite his own illustration, a careful picture restorer might do in order to secure the impression of a unified work, the unity aimed at by himself being rather that of a connected literary treatise than a series of lectures.

It is obvious that a product of this nature will vary considerably throughout in the degree that the personality and unique flavour of Hegel himself, whether viewed as writer or thinker, asserts itself.

The introductions[8] have been, it would appear, taken almost exclusively from Hegel's own MSS.; but even these remained unrevised for the press, owing to the premature and sudden death of their author.

Of the greater portion of the work we can merely form our judgment of the nature of its authenticity from the content itself. On the whole I should myself say that the result was more favourable than might under such conditions have been expected. The editor assures us expressly that so far as all illustrations and the substantive content of the work is concerned no attempt has been made whatever to supplement the same. Hegel is throughout here entirely responsible. I think, further, that the endeavour claimed by the editor to preserve the general character and tone (*Kolorit*) of Hegel's own diction has attained a degree of success that could only have been within the reach of devoted pupils and friends of the man himself, who

for many years both attended his lectures and studied his published works. Whatever opinion, however, we may arrive at on this head there can hardly be two opinions as to the sources in which the main interest consists for a modern reader.

First, I should lay particular stress on the forceful and characteristic manner in which the fundamental philosophical conceptions which underlie the entire fabric are worked into and elaborated explicitly, throughout its detail. The very nature of this unwearied and insistent interfusion (*Durchdringung*) of positive fact, whether historical, scientific, or aesthetic, with the dialectic movement of the Idea is here as essentially the method of Hegel as it is elsewhere. And this is so despite the fact that it is here presented for the most part in a form less repellent to the ordinary reader and less provocative of hostile criticism. Translators therefore, who, following the example of the French translator[9], deliberately seek to lighten the burden of their cargo by throwing overboard what they choose to call the "injurious dialectic," or the "dark labyrinth" of this aspect of our work may reproduce much that is of instruction or interest, but most certainly do not reproduce either the main strength of Hegel as a thinker, or the most characteristic impression — to say nothing of the repetitions — of such style or absence of literary style that he possessed.

Secondly, if there is one feature more striking than any other in this work, which is bound at least to surprise anyone who still harbours the obsolete notion that this philosopher moved in an exclusively abstract region of idea remote from the concrete experience of life and scientific or artistic knowledge, it is the wealth and extraordinary range of the illustrations in these volumes no less than the vigour and freshness of their application. In this respect two translations which merely amount to a summary of theoretical content simply omit the vital or at least the most attractive heart of the interest.

As to the present claim of this laborious work to recognition and study, its historical significance is, I think, admitted by the most acknowledged authorities on the subject. As Schasler has called it, it is the first complete system of a philosophy of Art. The nature of its importance to our own most able and learned historian of the Philosophy of Fine Art may not only be deduced from his own summary of its contents and significance in his invaluable historical survey[10], but is further illustrated by the fact that he has reproduced the concluding portion of Hegel's Introduction *in extenso* in an Appendix to this work.

Other writers have been less judicious both as hostile critics and in the degree of their praise or enthusiasm. One German authority has called it Hegel's masterpiece. Such a title is, apart from any other ground, sufficiently excluded by its history alone. Whether Hegel might have made it his masterpiece had he lived is of course another question.

Other admirers, such as the late Professor Caird[11], have more legitimately accepted such a distinction for the "Phenomenologie des Geistes." Mr. Hastie will even have it that throughout "All is clear, radiant, harmonious and dim with the things that are a joy for ever." Such an effusive display of abstract *Vorstellung* reminds one little of either the dour temper of the Swabian philosopher, or the concrete intelligence which most distinguishes him from his rivals now and in his lifetime. I can promise no such garden of Hesperides, or even Platonic banquet, to any of my readers. It is true that we have here, the work being primarily built upon lectures intended to instruct the ordinary student, no such parade of the dialectic method in its formal structure such as constitutes the root of offence in some other works of Hegel. But if we approach it with the belief that all is therefore the plain sailing we meet with in the world of journalistic art criticism and the commonsense conceptions of everyday life, or with the assurance that the work is, or can be, intelligible without some real attempt

to grapple with the fundamental ideas of Hegelian metaphysic, we may find our disappointment very considerable. As a humble translator I am bound to say that in a very large number of passages I have by no means discovered immediacy of intelligibility or radiance to be a conspicuous feature of the original. Radiance is indeed, I should say, not an attribute emphatically characteristic of any kind of Teutonic literature, and least of all of its scientific and philosophical literature. The present work is certainly no exception. With its untiring, not to say remorseless, effort to press home in repeated expression, often but slightly varied, the same fundamental points, its dogged and endless persistence in the careful explication through rational definition of every kind of positive material that presents itself from the nature of the divine in man, or the soul of living beast to the accurate determination in the terms of expressed thought of a musical sound or an epigram or simile, with its well-nigh total disregard of the beauty of literary style, and its by no means unfrequent disregard of all principle of proportion in the co-ordination of its varied subject-matter — whatever else such a product may be it is most assuredly not, at least to English apprehension, reminiscent of the radiance either of Homer or Apollo.

But though even sincere admiration may smile over such a description, it does unquestionably reflect to a remarkable extent the thoroughness, tenacity of purpose, the absence of superficial rhetoric, the wide range, the extraordinary combination of constructive idea and detailed knowledge and research we rightly associate with the most valued works of German science and philosophy. It has never been more needful than at this time of day to draw attention to such qualities, when the national bias is to ignore or belittle their presence. It is, moreover, not without passages which attain to a very real elevation of eloquence, eloquence marked by the profoundest earnestness and entirely free from the least flavour of bombast or sentimentalism. To the right kind of reader it can hardly fail to convey a

certain fascination which is not merely due to the presence of a powerful and original intellect, but is equally inseparable from the product of a human soul intent upon getting at the heart of its subject, and keeping its vision throughout fixed on that. Nor is the mere breadth of the canvas and the depth of its content its only attraction. The work is indeed full of digressions of exceptional interest to the general reader, and as such bears the indelible stamp of Hegel's manner as a lecturer, which his editor maintains stood out in such marked contrast to his more concise style as an author, drawing as he did when lecturing so largely on his encyclopaedic stores of knowledge.

To treat all the text as we now have it with the same respect may very possibly betoken to some an excess of zeal on the part of the translator; but after all the most important thing for an English reader is to know what the volumes actually contain. In dealing with Hegel the outlined sketch, whether secured through a process of distillation or adulteration, is by no means any compensation for the loss of the complete picture. If we are impatient over many aspects of this philosopher's particularity, we had much better dispense with him altogether.

Sympathetically studied it is hardly too much to say that this monumental work is an education in itself. It is at any rate one which cannot fail to enlarge our conceptions of the significance and dignity of human art. Nor is this by any means impossible, even though we are unable to concur in, or indeed remain insufficiently qualified to express a judgment upon all or even a few of the most important of its conclusions. But it is perhaps not wholly unnecessary to observe that before venturing upon a verdict in our wisdom we must, as Robert Browning submitted in reference to the criticism passed upon his poetry, have awakened both our senses and intelligence "that they may the better judge." It is the modest aim of the present translation to make that preparatory process more easy for the

English reader, to assist that intelligent assimilation of the truth as it appears to a great and world-famous thinker, which is the necessary condition of any criticism meriting respectful attention at all. Such assimilation is perhaps impossible in the case of Hegel without effort, and indeed something of sympathy with his general outlook and temper, making as he does little or no appeal whatever to the lover of literature as such, who had consequently far better leave him austerely alone to the consideration of others who are more attracted.

I do not propose in these prefatory remarks to enlarge further on the actual content of the work, or on the nature of the criticism which has been directed either to fundamental positions or matters of detail. Some of these I have referred to in my notes on the text where they are most obviously pertinent. The general reader will find a very useful introduction to some of the more primary difficulties in the study of Hegel in Professor Bosanquet's prefatory essay to his translation. The more serious student can hardly dispense with the perusal of a considerable portion of the same writer's history of Aesthetik, at least that portion which directly deals with the writings of Kant, Schiller, Goethe, Schelling, and Hegel himself on the subject[12].

I hold my translation to be as literal as is possible consistently with an endeavour to render or interpret German philosophical language in the language or idiom of really expressive and intelligible English. It is now generally admitted that all translation is in the nature of an interpretation. However much I may have fallen short of my aim, that aim has been throughout to express the actual ideal content of the German, not merely with all the force and directness I could muster, but with as near an approach to the formal structure of the German text as was consistent with the like condition of really readable English. Above all I have striven to avoid the lassitude of mere paraphrase, that vague generalization of content

which conceives itself to possess the right to eliminate from the text pretty much what it pleases.

The Index attached to the final volume is limited in its reference to proper names, and pre-eminently to illustrations in the text of works either of general literature, or other products of art, which I considered of use or interest to the general reader.

In the table of contents to the several volumes I have notified with brackets my own contributions to the German original. In all other respects I have retained the divisions of subject-matter as I found them recorded by Hegel or his editor.

F. P. O.

[1] New York, Appleton and Co.

[2] Chicago, Griggs and Co., 1885.

[3] Edinburgh, Oliver and Boyd, 1886. The translation is literal and of good quality for a little over thirty pages. After that it is a mere summary.

[4] Kegan Paul, Trench and Co., 1886.

[5] Mr. Kedney's volume only amounts to about three hundred small-sized pages altogether.

[6] The most important source were MSS. for lectures given in 1820. This formed the basis of further lectures in 1823, 1826, and 1829.

[7] The notes to which our editor had access referred to the lectures given in 1823 and 1826, with others of those in 1826 and 1829.

[8] The first Introduction is obviously taken from Hegel's MS., the editor not even venturing in this case to obliterate its form as an address in the lecture room. It represents perhaps the nearest approach we possess to the revised MS.

[9] An almost inevitable defect of such a translation is that criticism may be offered without supplying the material necessary for any satisfactory verdict upon its sufficiency. Thus M. Bénard cites with approval an adverse criticism passed upon what is called Hegel's inadequate treatment of the Idea of Beauty as a partial manifestation of the absolute Idea, but barely includes any of the passages which refer to this in his translation (note, p. 36). Such can lead to no conclusion whatever, though it obviously may entirely mislead his readers.

[10] "History of Aesthetik," by Bernard Bosanquet (Sonnenschein, 1892). See in particular pp. 333-362. With regard to the comparative value of the work of Schelling and Hegel on this subject the author says (p. 334): "It may be said that while we prefer Hegel to Schelling this is partly because Schelling is best represented in Hegel." I can claim but a very limited firsthand knowledge of modern German works on Aesthetik. But I may observe that the section of Lötze's history of German works on the subject devoted to Hegel's "Philosophy of Fine Art" appears to me by no means equal in ability to other portions of the work. The aim of the author appears rather that of proving that his own researches occupy a ground wholly unoccupied by Hegel than of defining with any completeness the ground actually appropriated by Hegel.

[11] "Life of Hegel," p. 110.

[12] The most authoritative introduction to the study of the Hegelian standpoint for English readers is, of course, the late Professor Wallace's Prolegomena to his translation of the lesser Logic, and the introduction to his translation of the Philosophy of Mind.

INTRODUCTION

I

The present inquiry[1] has for its subject-matter *Aesthetic*. It is a subject co-extensive with the entire *realm of the beautiful*; more specifically described, its province is that of *Art*, or rather, we should say, of *Fine Art.*

For a subject-matter such as this the term “Aesthetic” is no doubt not entirely appropriate, for “Aesthetic” denotes more accurately the science of the senses or emotion. It came by its origins as a science, or rather as something that to start with purported to be a branch of philosophy, during the period of the school of Wolff, in other words when works of art were generally regarded in Germany with reference to the feelings they were calculated to evoke, as, for example, the feelings of pleasure, admiration, fear, pity, and so forth. It is owing to the unsuitability or, more strictly speaking, the superficiality of this term that the attempt has been made by some to apply the name “Callistic” to this science. Yet this also is clearly insufficient inasmuch as the science here referred to does not investigate beauty in its general signification, but the beauty of art pure and simple. For this reason we shall accommodate ourselves to the term Aesthetic, all the more so as the mere question of nomenclature is for ourselves a matter of indifference. It has as such been provisionally accepted in ordinary speech, and we cannot do better than retain it. The *term*, however, which fully expresses our science is “Philosophy of Art,” and, with still more precision, “Philosophy of Fine Art.”

(*a*) In virtue of this expression we at once exclude the beauty of Nature from the scientific exposition of Fine Art. Such a limitation of our subject may very well appear from a certain point of view as an arbitrary boundary

line, similar to that which every science is entitled to fix in the demarcation of its subject-matter. We must not, however, understand the limitation of "Aesthetic" to the beauty of art in this sense. We are accustomed, no doubt, in ordinary life to speak of a beautiful colour, a beautiful heaven, a beautiful stream, to say nothing of beautiful flowers, animals, and, above all, of beautiful human beings. Without entering now into the disputed question how far the quality of beauty can justly be predicated of such objects, and consequently the beauty of Nature comes generally into competition with that of art, we are justified in maintaining categorically that the beauty of art stands *higher* than Nature. For the beauty of art is a beauty begotten, a new birth of mind[2]; and to the extent that Spirit and its creations stand higher than Nature and its phenomena, to that extent the beauty of art is more exalted than the beauty of Nature. Indeed, if we regard the matter in its formal aspect, that is to say, according to the way it is there, any chance fancy that passes through any one's head[3], is of higher rank than any product of Nature. For in every case intellectual conception and freedom are inseparable from such a conceit. In respect to *content* the sun appears to us an absolutely necessary constituent of actual fact, while the perverse fancy passes away as something accidental and evanescent. None the less in its own independent being a natural existence such as the sun possesses no power of self-differentiation; it is neither essentially free nor self-aware; and, if we regard it in its necessary cohesion with other things, we do not regard it independently for its own sake, and consequently not as beautiful.

Merely to maintain, in a general way, that mind and the beauty of art which originates therefrom stand *higher* than the beauty of Nature is no doubt to establish next to nothing. The expression *higher* is obviously entirely indefinite; it still indicates the beauty of Nature and art as standing juxtaposed in the field of conception, and emphasizes the difference as a quantitative and accordingly external difference. But in predicating of mind

and its artistic beauty a higher place in contrast to Nature, we do not denote a distinction which is merely relative. Mind, and mind alone, is pervious to truth, comprehending all in itself, so that all which is beautiful can only be veritably beautiful as partaking in this higher sphere and as begotten of the same. Regarded under this point of view it is only a reflection of the beauty appertinent to mind, that is, we have it under an imperfect and incomplete mode, and one whose substantive being is already contained in the mind itself.

And apart from this we shall find the restriction to the beauty of art only natural, for in so far as the beauties of Nature may have come under discussion — a rarer occurrence among ancient writers than among ourselves — yet at least it has occurred to no one to insist emphatically on the beauty of natural objects to the extent of proposing a science, or systematic exposition of such beauties. It is true that the point of view of *utility* has been selected for such exclusive treatment. We have, for example, the conception of a science of natural objects in so far as they are useful in the conflict with diseases, in other words a description of minerals, chemical products, plants, animals, which subserve the art of healing. We do not find any analogous exploitation and consideration of the realm of Nature in its aspect of beauty. In the case of natural beauty we are too keenly conscious that we are dealing with an indefinite subject-matter destitute of any real criterion. It is for this reason that such an effort of comparison would carry with it too little interest to justify the attempt.

These preliminary observations over beauty in Nature and art, over the relation of both, and the exclusion of the first-mentioned from the province of our real subject-matter are intended to disabuse us of the notion that the limitation of our science is simply a question of capricious selection. We have, however, not reached the point where a *demonstration* of this fact is feasible for the reason that such an investigation falls within the limits of

our science itself, and it is therefore only at a later stage that we can either discuss or prove the same.

Assuming, however, that we have, by way of prelude, limited our inquiry to the beauty of art, we are merely by this first step involved in fresh difficulties.

(*b*) What must first of all occur to us is the question whether Fine Art in itself is truly susceptible to a scientific treatment. It is a simple fact that beauty and art pervade all the affairs of life like some friendly genius, and embellish with their cheer all our surroundings, mental no less than material. They alleviate the strenuousness of such relations, the varied changes of actual life; they banish the tedium of our existence with their entertainment; and where nothing really worth having is actually achieved, it is at least an advantage that they occupy the place of actual vice. Yet while art prevails on all sides with its pleasing shapes, from the crude decorations of savage tribes up to the splendours of the sacred shrine adorned with every conceivable beauty of design, none the less such shapes themselves appear to fall outside the real purposes of life, and even where the imaginative work of art is not impervious to such serious objects, nay, rather at times even appear to assist them, to the extent at least of removing what is evil to a distance, yet for all that art essentially belongs to the *relaxation* and *recreation* of spiritual life, whereas its substantive interests rather make a call upon its strained energy. On such grounds an attempt to treat that which on its own account is not of a serious character with all the gravity of scientific exposition may very possibly appear to be unsuitable and pedantic. In any case from such a point of view art appears a *superfluity* if contrasted with the essential needs and interests of life, even assuming that the *softening* of the soul which a preoccupation with the beauty of objects is capable of producing, does not actually prove injurious in its effeminate influence upon the serious quality of those *practical* interests.

Owing to this fundamental assumption that they are a luxury it has often appeared necessary to undertake the defence of the fine arts relatively to the necessities of practical life, and in particular relatively to morality and piety; and inasmuch as this harmlessness is incapable of demonstration, the idea has been at least to make it appear credible, that this luxury of human experience contributes a larger proportion of *advantages* than *disadvantages*. In this respect serious aims have been attributed to art, and in many quarters it has been commended as a mediator between reason and sensuous associations, between private inclinations and duty, personified in short as a reconciler of these forces in the strenuous conflict and opposition which this antagonism generates. But it is just conceivable[4] that, even assuming the presence of such aims with all their indubitably greater seriousness, neither reason nor duty come by much profit from such mediation, for the simple reason that they are incapable by their very nature of any such interfusion or compromise, demanding throughout the same purity which they intrinsically possess. And we might add that art does not become in any respect more worthy thereby of scientific discussion, inasmuch as it remains still on two sides a menial, that is, subservient to idleness and frivolity, if also to objects of more elevated character. In such service, moreover, it can at most merely appear as a means instead of being an object for its own sake. And, in conclusion, assuming that art is a means, it still invariably labours under the formal defect, that so far as it in fact is subservient to more serious objects, and produces results of like nature, the means which actually brings this about is *deception.* For beauty is made vital in the *appearance*[5]. Now it can hardly be denied that aims which are true and serious ought not to be achieved by deception; and though such an effect is here and there secured by this means, such ought only to be the case in a restricted degree; and even in the exceptional case we are not justified in regarding deception as the right means. For the means ought to

correspond with the dignity of the aim. Neither semblance nor deception, but only what is itself real and true, possesses a title to create what is real and true. Just in the same way science has to investigate the true interests of the mind in accordance with the actual process of the real world and the manner of conceiving it as we actually find it.

We may possibly conclude from the above grounds that the art of beauty is unworthy of philosophical examination. It is after all, it may be said, only a pleasant pastime, and, though we may admit more serious aims are also in its purview, nevertheless it is essentially opposed to such aims in their seriousness. It is at the most merely the servant of specific amusements no less than the exceptional serious objects, and for the medium of its existence as also for the means of its operations can merely avail itself of deception and show.

But yet further in the *second* place, it is a still more plausible contention that even supposing fine art to be compatible generally with philosophical disquisition, none the less it would form no really adequate subject-matter for scientific enquiry in the strict sense. For the beauty of art is presented to sense, feeling, perception, and imagination: its field is not that of thought, and the comprehension of its activity and its creations demands another faculty than that of the scientific intelligence. Furthermore, what we enjoy in artistic beauty is just the *freedom* of its creative and plastic activity. In the production and contemplation of these we appear to escape the principle of rule and system. In the creations of art we seek for an atmosphere of repose and animation as some counterpoise to the austerity of the realm of law and the sombre self-concentration of thought; we seek for blithe and powerful reality in exchange for the shadow-world of the Idea. And, last of all, the free activity of the imagination is the source of the fair works of art, which in this world of the mind are even more free than Nature is herself. Not only has art at its service the entire wealth of natural form in all their

superabundant variety, but the creative imagination is able inexhaustibly to extend the realm of form by its *own* productions and modifications. In the presence of such an immeasurable depth of inspired creation and its free products, it may not unreasonably be supposed that thought will lose the courage to apprehend such in their apparent *range*, to pronounce its verdict thereon, and to appropriate such beneath its universal formulae.

Science, on the other hand, everyone must admit, is formally bound to occupy itself with thinking which abstracts from the mass of particulars: and for this very reason, from one point of view, the imagination and its contingency and caprice, in other words the organ of artistic activity and enjoyment, is excluded from it. On the other hand, when art gives joyous animation to just this gloomy and arid dryness of the notion, bringing its abstractions and divisions into reconciliation with concrete fact, supplementing with its detail what is wanting to the notion in this respect, even in that case a *purely* contemplative reflection simply removes once more all that has been added, does away with it, conducting the notion once again to that simplicity denuded of positive reality which belongs to it and its shadowland of abstraction. It is also a possible contention that science in respect to content is concerned with what is essentially *necessary.* If our science of Aesthetic places on one side natural beauty, not merely have we apparently made no advance, but rather separated ourselves yet further from what is necessary. The expression *Nature* implies from the first the ideas of *necessity* and *uniformity*, that is to say a constitution which gives every expectation of its proximity and adaptability to scientific inquiry. In mental operations generally, and most of all in the imagination, if contrasted in this respect with Nature, caprice and superiority to every kind of formal restriction, caprice, it is here assumed, is uniquely in its right place, and these at once put out of court the basis of a scientific inquiry.

From each and all these points of view consequently, in its origin, that is to say, in its effect and in its range, fine art, so far from proving itself fitted for scientific effort, rather appears fundamentally to resist the regulative principle of thought, and to be ill-adapted for exact scientific discussion.

Difficulties of this kind, and others like them, which have been raised in respect to a thoroughly scientific treatment of fine art have been borrowed from current ideas, points of view, and reflection, the more systematic expansion of which we may read *ad nauseam* in previous literature, in particular French literature, upon the subject of beauty and the fine arts. Such contain to some extent facts which have their justification; in fact, elaborate arguments[6] are deduced therefrom, which also are not without their tincture of apparent plausibility. In this way, for instance, there is the fact that the configuration of beauty is as multifold as the phenomenon of beauty is of universal extension; from which we may conclude, if we care to do so, that a universal impulse towards beauty is enclosed in our common nature, and may yet further conceivably infer, that because the conceptions of beauty are so countless in their variety and withal are obviously something *particular*, it is impossible to secure laws of *universal* validity either relatively to beauty or our taste for it.

Before turning away from such theories to the subject, as we ourselves conceive it, it will be a necessary and preliminary task to discuss the questions and objections raised above.

First, as to the *worthiness* of art to form the object of scientific inquiry, it is no doubt the case that art can be utilized as a mere pastime in the service of pleasure and entertainment, either in the embellishment of our surroundings, the imprinting of a delight-giving surface to the external conditions of life, or the emphasis placed by decoration on other objects. In these respects it is unquestionably no independent or free art, but an art subservient to certain objects. The kind of art, however, which *we* ourselves

propose to examine is one which is *free* in its aim and its means. That art in general can serve other objects, and even be merely a pastime, is a relation which it possesses in common with thought itself. From one point of view thought likewise, as science subservient to other ends, can be used in just the same way for finite purposes and means as they chance to crop up, and as such serviceable faculty of science is not self-determined, but determined by something alien to it. But, further, as distinct from such subservience to particular objects, science is raised of its own essential resources in free independence to truth, and exclusively united with its own aims in discovering the true fulfillment in that truth.

Fine art is not art in the true sense of the term until it is also thus free, and its *highest* function is only then satisfied when it has established itself in a sphere which it shares with religion, and philosophy, becoming thereby merely one mode and form through which the *Divine*, the profoundest interests of mankind, and spiritual truths of widest range, art brought home to consciousness and expressed. It is in works of art that nations have deposited the richest intuitions and ideas they possess; and not infrequently fine art supplies a key of interpretation to the wisdom and religion of peoples; in the case of many it is the only one. This is an attribute which art shares in common with religion and philosophy, the peculiar distinction in the case of art being that its presentation of the most exalted subject-matter is in sensuous form, thereby bringing them nearer to Nature and her mode of envisagement, that is closer to our sensitive and emotional life. The world, into the profundity of which thought penetrates, is a supersensuous one, a world which to start with is posited as a Beyond in contrast to the immediacy of ordinary conscious life and present sensation. It is the freedom of reflecting consciousness which disengages itself from this immersion in the "*this side*," or immediacy, in other words sensuous reality and finitude. But the mind is able, too, to heal the *fracture* which is thus

created in its progression. From the wealth of its own resources it brings into being the works of fine art as the primary bond of mediation between that which is exclusively external, sensuous and transitory, and the medium of pure thought, between Nature and its finite reality, and the infinite freedom of a reason which comprehends. Now it was objected that the *element*[7] *of art* was, if we view it as a whole, of an *unworthy* character, inasmuch as it consisted of appearance and deceptions inseparable from such. Such a contention would of course be justifiable, if we were entitled to assume that appearance had no *locus standi*[8] at all. An appearance or show is, however, essential to actuality. There could be no such thing as truth if it did not appear, or, rather, let itself appear[9], were it not further true for some *one* thing or person, *for* itself as also *for* spirit. Consequently it cannot be appearance in general against which such an objection can be raised, but the particular mode of its manifestation under which art makes actual what is essentially real and true. If, then, the appearance, in the medium of which art gives determinate existence to its creations, be defined as *deception*, such an objection is in the first instance intelligible if we compare it with the *external world* of a phenomena, and its *immediate* relation to ourselves as material substance, or view it relatively to our own world of emotions, that is our inward sensuous life. Both these are worlds to which in our everyday life, the life, that is, of visible experience, we are accustomed to attach the worth and name of reality, actuality and truth as contrasted with that of art, which fails to possess such reality as we suppose. Now it is just this entire sphere of the empirical world, whether on its personal side or its objective side, which we ought rather to call in a stricter sense than when we apply the term to the world of art, merely a show or appearance, and an even more unyielding form of deception. It is only beyond the immediacy of emotional life and that world of external objects that we shall discover reality in any true sense of the term. Nothing

is actually real but that which is actual in its own independent right and substance[10], that which is at once of the substance of Nature and of mind, which, while it is actually *here* in present and determinate existence, yet retains under such limitation an essential and self-concentred being, and only in virtue of such is truly real. The predominance of these universal powers is precisely that which art accentuates and manifests. In the external and soul-world of ordinary experience we have also no doubt this essence of actuality, but in the chaotic congeries of particular detail, encumbered by the immediacy of sensuous envisagement, and every kind of caprice of condition, event, character, and so forth. Now it is just the show and deception of this false and evanescent world which art disengages from the veritable significance of phenomena to which we have referred, implanting in the same a reality of more exalted rank born of mind. The phenomena of art therefore are not merely not appearance and nothing more; we are justified in ascribing to them, as contrasted with the realities of our ordinary life, an actually higher reality and more veritable existence. To as little extent are the representations of art a deceptive appearance as compared with the assumed truer delineations of historical writing. For immediate existence also does not belong to historical writing. It only possesses the intellectual appearance of the same as the medium of its delineations, and its content remains charged with the entire contingent *materia* of ordinary reality and its events, developments and personalities, whereas the work of art brings us face to face with the eternal powers paramount in history with this incidental association of the immediate sensuous present and its unstable appearance expunged.

If, however, it is in contrast with philosophic thought and religious and ethical principles, that the mode of appearance of the shapes of art, is described as a deception, there is certainly this in support of the view that the mode of revelation attained by a content in the realm of thought is the

truest reality. In comparison, nevertheless, with the appearance of immediate sensuous existence and that of historical narration, the show of art possesses the advantage that, in its own virtue, it points beyond itself, directing us to a somewhat spiritual, which it seeks to envisage to the conceptive mind. Immediate appearance, on the contrary, does not give itself out to be thus illusive, but rather to be the true and real, though as a matter of fact such truth is contaminated and obstructed by the immediately sensuous medium. The hard rind of Nature and the everyday world offer more difficulty to the mind in breaking through to the Idea than do the products of art.

But if from this particular point of view we place art thus highly, we must not, on the other hand, fail to remember that neither in respect to content or form is art either the highest or most absolute mode of bringing the true interests of our spiritual life to consciousness. The very form of art itself is sufficient to limit it to a definite content. It is only a particular sphere and grade of truth which is capable of being reproduced in the form of a work of art. Such truth must have the power in its own determinate character to go out freely into sensuous shape and remain adequate to itself therein, if it is to be the genuine content of art, as is the case, for example, with the gods of Greece. On the other hand there is a profounder grasp of truth, in which the form is no longer on such easy and friendly terms with the sensuous material as to be adequately accepted and expressed by that medium. Of such a type is the Christian conception of truth; and above all it is the prevailing spirit of our modern world, or, more strictly, of our religion and our intellectual culture, which have passed beyond the point at which art is the highest mode under which the absolute is brought home to human consciousness. The type peculiar to art-production and its products fails any longer to satisfy man’s highest need. We are beyond the stage of reverence for works of art as divine and objects deserving our worship. The

impression they produce is one of a more reflective[11] kind, and the emotions which they arouse require a higher test and a further verification. Thought and reflection have taken their flight above fine art. To those who are fond of complaint and grumbling such a condition of things may be held as a form of decadence; it may be ascribed to the obsession of passion and selfish interests, which scare away the seriousness of art no less than its blithesomeness. Or we may find the fault to lie in the exigencies of the present day, the complex conditions of social and political life, which prevent the soul, entangled as it is in microscopic interests, from securing its freedom in the nobler objects of art, a condition, too, in which the intelligence itself becomes a menial to such trifling wants and the interests they excite in sciences, which subserve objects of a like nature, and are seduced into the voluntary exile of such a wilderness.

But however we may explain the fact it certainly is the case that Art is no longer able to discover that satisfaction of spiritual wants, which previous epochs and nations have sought for in it and exclusively found in it, a satisfaction which, at least on the religious side, was associated with art in the most intimate way. The fair days of Greek art, as also the golden time of the later middle ages, are over. The reflective culture of our life of to-day makes it inevitable, both relatively to our volitional power and our judgment, that we adhere strictly to general points of view, and regulate particular matters in consonance with them, so that universal forms, laws, duties, rights, and maxims hold valid as the determining basis of our life and the force within of main importance. What is demanded for artistic interest as also for artistic creation is, speaking in general terms, a vital energy, in which the universal is not present as law and maxim, but is operative in union with the soul and emotions, just as also, in the imagination, what is universal and rational is enclosed only as brought into unity with a concrete sensuous phenomenon. For this reason the present

time is not, if we review its conditions in their widest range, favourable to art. And with regard to the executive artist himself it is not merely that reflection on every side, which *will* insist on utterance, owing to the universal habit of critical opinion and judgment, leads him astray from his art and infects his mind with a like desire to accumulate abstract thought in his creations; rather the entire spiritual culture of the times is of such a nature that he himself stands within a world thus disposed to reflection and the conditions it presupposes, and, do what he may, he cannot release himself either by his wish or his power of decision from their influence, neither can he by means of exceptional education, or a removal from the ordinary conditions of life, conjure up for himself and secure a solitude capable of replacing all that is lost.

In all these respects art is and remains for us, on the side, of its highest possibilities, a thing of the past. Herein it has further lost its genuine truth and life, and is rather transported to our world of *ideas* than is able to maintain its former necessity and its superior place in reality. What is now stimulated in us by works of art is, in addition to the fact of immediate enjoyment, our judgment. In other words we subject the content, and the means of presentation of the work of art, and the suitability and unsuitability of both, to the contemplation of our thought. A *science* of art is therefore a far more urgent necessity in our own days than in times in which art as art sufficed by itself alone to give complete satisfaction. We are invited by art to contemplate it reflectively, not, that is to say, with the object of recreating such art[12], but in order to ascertain scientifically its nature.

In doing our best to accept such an invitation we are confronted with the objection already adverted to, that even assuming that art is a subject adapted for philosophical investigation in a general way, yet it unquestionably is not so adapted to the systematic procedure of science.

Such an objection, however, implies to start with the false notion that we can have a philosophical inquiry which is at the same time unscientific. In reply to such a point I can only here state summarily my opinion, that whatever ideas other people may have of philosophy and philosophizing, I myself conceive philosophical inquiry of any sort or kind to be inseparable from the methods of science. The function of philosophy is to examine subject-matter in the light of the principle of necessity, not, it is true, merely in accordance with its subjective[13] necessity or external co-ordination, classification, and so forth; it has rather to unfold and demonstrate the object under review out of the necessity of its own intimate nature. Until this essential process is made explicit the scientific quality of such an inquiry is absent. In so far, however, as the objective necessity of an object subsists essentially in its logical and metaphysical nature the isolated examination of art may in such a case, at any rate, or rather inevitably, must be carried forward with a certain relaxation of scientific stringency. For art is based upon many assumptions, part of which relate to its content, part to its material or conceptive[14] medium, in virtue of which art is never far from the borders of contingency and caprice. Consequently it is only relatively to the essential and ideal progression of its content and its means of expression that we are able to recall with advantage the formative principle of its necessity[15].

The objection that works of fine art defy the examination of scientific thought, because they originate in the unregulated world of imagination and temperament, and assert their effect exclusively on the emotions and the fancy with a complexity and variety which defies exact analysis, raises a difficulty which still carries genuine weight behind it[16]. As a matter of fact the beauty of art does appear in a form which is expressly to be contrasted with abstract thought, a form which it is compelled to disturb in order to exercise its own activity in its own way. Such a result is simply a corollary

of the thesis that reality anywhere and everywhere, whether the life of Nature or mind, is defaced and slain by its comprehension; that so far from being brought more close to us by the comprehension of thinking, it is only by this means that it is in the complete sense removed apart from us, so that in his attempt to grasp through thought as a *means* the nature of life, man rather renders nugatory this very aim. An exhaustive discussion of the subject is here impossible; we propose merely to indicate the point of view from which the removal of this difficulty or impossibility and incompatibility might be effected. It will at least be readily admitted that mind is capable of self-contemplation, and of possessing a consciousness, and indeed one that implies a power of thought co-extensive with itself and everything which originates from itself. It is, in fact, precisely *thought*, the process of thinking, which constitutes the most intimate and essential nature of mind. It is in this thinking-consciousness over itself and its products, despite all the freedom and caprice such may otherwise and indeed must invariably possess — assuming only mind or spirit to be veritably pregnant therein — that mind exhibits the activity congenial to its essential nature. Art and the creations of art, being works which originate in and are begotten of the spirit, are themselves stamped with the hall-mark of spirit, even though the mode of its presentation accept for its own the phenomenal guise of sensuous reality, permeating as it does the sensuous substance with intelligence. Viewed in this light art is placed from the first nearer to spirit and its thought than the purely external and unintelligent Nature. In the products of art mind is exclusively dealing with that which is its own. And although works of art are not thought and notion simply as such, but an evolution of the notion out of itself, an alienation of the same in the direction of sensuous being, yet for all that the might of the thinking spirit is discovered *not merely* in its ability to grasp *itself* in its most native form as pure thinking, but also, and as completely, to recognize itself in its self-

divestment in the medium of emotion and the sensuous, to retain the grasp of itself in that "other" which it transforms but is not, transmuting the alien factor into thought-expression, and by so doing recovering it to itself. And moreover in this active and frequent relation to that "other" than itself the reflective mind is not in any way untrue to itself. We have here no oblivion or surrender of itself; neither is it so impotent as to be unable to comprehend what is differentiated from that other[17]; what it actually does is to grasp in the notion *both* itself and its opposite. For the notion is the universal, which maintains itself in its particularizations, which covers in its grasp both itself and its "other," and consequently contains the power and energy to cancel the very alienation into which it passes. For this reason the work of art, in which thought divests itself of itself[18], belongs to the realm of comprehending thought; and mind, by subjecting it[19] to scientific contemplation, thereby simply satisfies its most essential nature. For inasmuch as thought is its essence and notion, it can only ultimately find such a satisfaction after passing all the products of its activity through the alembic of rational thought, and in this way making them for the first time in very truth part of its own substance. But though art, as we shall eventually see with yet more distinctness, is far indeed from being the highest form of mind, it is only in the philosophy of art that it comes into all that it may justly claim.

In the same way art is not debarred from a philosophical inquiry by reason of its unregulated caprice. As already intimated, it is its true function to bring to consciousness the highest interests of mind. An immediate consequence of this is that, so far as the *content* of fine art is concerned, it cannot range about in all the wildness of an unbridled fancy; these interests of spirit posit categorically for the content that embodies them definite points of attachment[20], however multifold and inexhaustible may be the forms and shapes they assume. The same may be said of the forms

themselves. They too do not remain unaffected by constraining principles. It is not every chance form which is capable of expressing and presenting these interests, capable of assimilating them and reproducing them. It is only through one determinate content that the form adequate to its embodiment is defined.

It is upon grounds such as these that we are also able to discover a track adapted to critical reflection through the apparently endless vistas of artistic creations and shapes.

We have now, I trust, by way of prelude, succeeded in restricting the content of our science on the lines of definition proposed. We have made it clear that neither is fine art unworthy of philosophical study, nor is such a philosophical study incapable of accepting as an object of its cognition the essence of fine art.

II

If we now investigate the required *mode* of such scientific investigation, we are here again face to face with two contradictory modes of handling the subject, each of which appears to exclude the other and to permit us to arrive at no satisfactory result.

On the one hand we *observe* the science of art, merely so to speak, from an external point of view busying itself with actual works of art, cataloguing them in a history of art, drawing up a sort of commentary upon extant works, or propounding theories which are intended to supply the general points of view for artistic criticism no less than artistic production.

On the other hand we find science wholly giving itself up in its independence and self-assured to the contemplation of the beautiful, offering generalizations which do not concern the specific characteristics of a work of art, producing in short an abstract philosophy of the beautiful.

1. With regard to the first mentioned method of study, the starting-point of which is the *empirical* study of definite *facts*, such is the path everyone must tread who means to study art at all. And just as everyone nowadays, even though he does not actually concern himself with physical science, yet deems it indispensable to his intellectual equipment to have some kind of knowledge of the principles of that science[21], so too it is generally considered more or less essential to any man of real cultivation, that he should possess some general knowledge of art; and indeed the pretension to be ranked as dilletante, or even as genuine *connoisseur*, meets with comparatively few exceptions.

(*a*) If however knowledge of this kind is really to claim the rank of *connoisseurship* of the first class it must be both varied in its character and of the widest range. It is an indispensable condition to such that it should possess an accurate knowledge of the well-nigh limitless field of particular works of art both of ancient and modern times, some of which have already disappeared, while others are only to be found in distant countries or portions of the globe, and which it is the misfortune of our situation to be unable to inspect. Add to this that every work of art belongs to *one* age, *one* nationality, and depends upon particular historical or other ends and ideas. On account of this it is indispensable that the finest type of art-scholarship should have at its command not merely historical knowledge of a wide range, but knowledge that is highly specialized. In other words, a work of art is associated with particular[22] detail in a peculiar sense, and a specific treatment, is imperative to the comprehension and interpretation of it. And in conclusion this connoisseurship of the finest class does not merely imply like every other a retentive memory, but also a keen imaginative sense, in order to hold clearly before the mind the images of such artistic representations in all their characteristic lines, and above all, to have them ready for comparison with other works of art.

(*b*) Within the limits of such a method of study which is primarily historical[23], distinct points of view will soon assert themselves which in the contemplation of such works we are not suffered to lose sight of, inasmuch as they are indispensable to a critical verdict. Such points of view, as is the case with other sciences the commencement of which is empirical, are summarized, after their due collection as separate units and comparison, in general criteria and propositions, emerging in a yet further stage of formal generalization in "*Theories* of the arts." This is not the place to dwell at length upon literature of this kind; we will merely recall a few specimens of such work in the most general way. There is, for instance, the "Poetics" of Aristotle, which contains a theory of tragedy still of real interest. With still more pertinency among the ancients the "Ars Poetica" of Horace and the Essay on the "Sublime" by Longinus will exemplify generally the manner in which this type of theorizing is carried out. The general theses which are therein formulated are intended to stand as premises and rules, in accordance with which works of art ought to be produced, their necessity being above all insisted on in times of the decadence of poetry and art. They are, in short, prescriptions to the practitioner. The prescriptions, however, of these physicians of art were even less successful in their curative effect on art than are the ordinary ones in the restoration of bodily health.

As to such theories I will merely remark that although in their *detail* they contain much that is instructive, yet what they have to say is based on a very limited range of artistic production, which passed no doubt for *the* superlatively beautiful ones, but for all that occupied but a very restricted portion of the entire field of survey. From a further point of view such generalizations are in part very trivial reflections, which in their generality led up to no secure grasp of actual detail, though that is above all the matter of most importance. The epistle of Horace already cited is full of such

general theses, and consequently a book for everyone, but one which for this very reason contains much of no importance at all. Take the lines:

Omne tulit punctum qui miscuit utile dulci
Lectorum delectando pariterque monendo —

"He carries all votes who has interfused the useful and the pleasant, by at the same time charming and instructing his reader." This is no better than copybook headings such as "Stay where you are and earn an honest sixpence" — which are good enough as generalization, but are defective in the concrete determinacy upon which action depends. An interest of another kind deducible from this type of artistic study does not so much consist in the expressed object to promote the production of genuine works of art: the intention appears to be rather that of influencing the judgment of others upon artistic works by such theories, creating, in short, a *standard of taste.* It is for an object of this kind that Horne's "Elements of Criticism," the writings of Batteux, and Ramler's "Introduction to the Fine Arts" have found many readers in their day. Taste, in this sense, has to do with co-ordination and artistic treatment, the thing in its right place, and all that concerns the finish of that which belongs to the external embodiment of a work of art. Add to this that to the principles of such a taste views were attached which belonged to the psychology in fashion at the time, views which had been discovered by empirical observations of capacities and activities of the soul, or of passions and their potential aggrandizement, succession, and so forth. It is, however, an invariable fact that every one forms his opinion of works of art, or characters, actions and events according to the measure of his insight and his perceptive temperament; and inasmuch as the formation of taste to which we have referred merely touched what was external and therefore jejune, and apart from this deduced its prescriptions entirely from a limited circle of artistic works and an

intellectual culture and emotional discipline equally restricted, its sphere of influence was ineffective, and it had neither the power to comprehend the profounder significance[24] and the true, nor to make the vision more keen for their apprehension.

Such theories proceed through generalization as do the rest of the non-philosophic sciences. The content which they submit to examination is accepted from ordinary ideas as something final and received as such. Questions are then asked about the constitution of such a concept, the need for more distinct specification making itself apparent, and this too is borrowed from current ideas, and forthwith finally established from it in definitions. But in such a procedure we at once find ourselves on an insecure basis exposed to controversy. It might in the first instance no doubt appear that the beautiful was quite a simple idea. But we soon discover it combines several aspects; one writer will emphasize one of these, another some other one; or, even assuming the same points of view are considered, the question for dispute still remains which aspect is to be regarded as essential.

With regard to such questions it is generally reckoned as inseparable from scientific completeness, that the various definitions of the beautiful should be enumerated and criticized. For ourselves we do not propose to attempt this with such historical *exhaustiveness* as would unfold all the many refinements of such essays at definition, nor indeed on account of their *historical* interest. We simply, by way of illustration, shall offer a few specimens of the more recent and more interesting ways of regarding the matter which do in fact hit off pretty nearly what is actually implied in the idea of the beautiful. With this in view it is of first importance to recall Goethe's definition of the beautiful, which Meyer has incorporated in his "History of the Creative Arts in Greece," in which work he also brings forward the views of Hirt, though he does not actually mention his name.

Hirt, one of the greatest among connoisseurs of the first class in our time, in his “Essay upon Fine Art” (*Horen*, 1797, seventh number), after considering the beautiful in the several arts, summarizes his conclusions in the statement that the basis of a just criticism of fine art and cultivation of taste is the idea of the *Characteristic.* In other words he defines the beautiful ultimately as the “Consummate[25] which is or can be an object of eye, ear, or imagination.” He then proceeds to define this “consummate” as “that which is adequate to its aim, which nature or art aimed at producing in the constitution of the object — after its generic kind and specific type.” For which reason it is necessary that, in order to instruct our critical sense of beauty, we should direct our attention, so far as possible, to the specific indications of the object’s essential constitution. It is, in fact, these *insignia* of individuality which are its characteristic. Consequently under the term *character* as a principle of art he understands “that definite individual characterization[26], whereby forms, movement and gesture, mien and expression, local colouring, light and shadow, chiaroscuro and pose are severally distinguished in due relation of course to the requirements of the object previously selected.” This formula is more significant in its actual terms than other definitions in vogue. If we proceed to ask what the “characteristic” is we find that it implies, first, a *content*, as, for instance, a definite emotion, situation, event, action, individual person or thing; secondly, the specific *manner* in accordance with which such a content is represented. It is to this mode or manner of presentation that the artistic principle of the “characteristic” is related. It requires that every aspect of detail in the mode of expression shall subserve the clearer definition of that expression’s content, and become a vital member of such expression.

The abstract determination of the characteristic emphasizes therefore the pertinency with which particular detail ought to bring into prominence the content which it is intended to reproduce. Attempting an elucidation of this

conception apart from technical phrase we may state the limitation implied in it as follows: In the drama, for instance, it is an action which constitutes the content. That is to say, the drama has to represent how this or that action takes place. Now men do all kinds of different things. They speak to each other, take their meals, sleep, put on their clothes, say this and that, and all the rest of it. But in all this business of life what does not lie in immediate relation with the particular action selected as the real dramatic content, must be excluded in order that relatively to it everything shall be significant. In the same way in a picture which only includes one moment of that action, and it is possible to accumulate — such are the countless vistas into which the objective world draws us — a mass of circumstances, persons, situations or other occurrences, which stand in no relation to the specific action as it actually occurs, nor subserve in any way the clearer characterization of the same. But according to the definition given of the characteristic only that ought to enter into a work of art, which is appertinent to the manifestation and essential expression of precisely this one content and no other. Nothing must declare itself as idle or superfluous.

This definition is no doubt of real importance, and from a certain point of view admits of justification. Meyer, however, in the work cited, is of opinion that the view propounded has vanished, every vestige of it, and in his opinion only to the advantage of art. Such a conception he thinks would in all probability lead to caricature. This judgment is based on the previous idea that an attempt of this kind to define the beautiful once and for all is associated with the notion of *prescription.* The philosophy of art has absolutely nothing to do with precepts for artists. The object is to unfold the essential nature of the beautiful, and — apart from any intention to propound rules for the executant — how it is illustrated in actual work, that is works of art. To such a criticism we may observe that the definition of Hirt no doubt includes what is capable of being caricature, for caricature

may also be characteristic. The obvious point to make, however, against it is this, that in caricature character in its definition is emphasized to the point of exaggeration and is, if we may say so, a superfluity of the characteristic. But a surfeit of this kind is no longer appropriate to the characteristic, but a burdensome reiteration whereby the characteristic may itself be ousted from what it ought to be. Moreover, what is of the nature of caricature is displayed as the characteristic presentment of what is ugly, which is of course a mode of distortion. *Ugliness* is in its own right in this way more closely related to the content[27], so that it may be actually asserted that the principle of the characteristic includes also ugliness and the presentment of the same as a part of its essential determination. The definition of Hirt, of course, gives us no further account of the content of the beautiful. It merely supplies us in this respect with a purely formal statement, which, however, contains real truth in it although formulated in abstract terms.

There is, however, the further question — what Meyer would substitute for the artistic principle of Hirt, what he proposes himself? He deals in the first instance exclusively with the principle as we have it in ancient works of art, which, however, must contain in the widest connotation of the term the essential determinant[28] of beauty[29]. In doing so he finds occasion to refer to Mengs and to Winckelmann's definition of the Ideal, and expresses himself to the effect that he does not wish either to reject or wholly to accept this principle of beauty, but on the other hand that he feels no hesitation in subscribing to the opinion of an enlightened judge of art (that is Goethe), inasmuch as its meaning is distinct and it appears to solve the problem with more accuracy. Now what Goethe says is this: "The highest principle of the ancients was the *significant*; the highest result of successful artistic *handling* is the *beautiful*."

If we look more closely at what this dictum implies we have again once more two aspects, that is to say a content or subject matter, and the mode of

its presentation. In our consideration of a work of art we begin with that which is directly presented to us, and after seeing it we proceed to inquire what its significance or content is. That external husk possesses no value to us simply as such. We assume that there is an inward, an ideality or a significance behind it, in virtue of which the external appearance is made alive with mind or spirit. It is to this, its soul, that the external appearance points and attests. For an appearance which is significant of something does not present itself to us, and merely that which it is *quâ* externality, but something other than this; as also does the symbol for example and with yet more clarity the fable, the significance of which is simply the moral and teaching of the same. In fact there is no word which does not point to a meaning, possessing no value by itself. In the same way the human eye, the face, flesh, skin, the entire presence are a revelation of spirit, intelligence and soul; and in such a case the significance is without exception something beyond that which is offered in the bare appearance. In this way too the work of art must possess significance; it must not appear to have told its tale simply in the fact of particular lines, curves, surfaces, indentations, reliefs of stone-work, in particular colours, tones, sounds of words, whatever medium in fact art may employ. Its function is to unveil an inward or ideal vitality, emotion, soul, a content and mind, which is precisely what we mean by the significance of a work of art.

This demand, therefore, for significance in a work of art is to all intents, and in its embrace much the same thing as Hirt’s principle of the characteristic.

According to this conception we find as characteristic constituents of the beautiful an inward somewhat, a content, and an external rind which possesses that content as its significance. The inner or ideal constituent appears in the external and thus enables itself to be recognized, that which is external pointing away from itself to the inward.

We cannot, however, pursue the matter here into further detail.

(*c*) But the earlier fashion of this "theory-spinning," no less than the laying down of rules for the executant already adverted to, has already been thrust on one side despotically in Germany — mainly owing to the appearance of genuine living poetry — and the right of genius, its work and effects, have had their full independence insisted upon as against the pretensions of such rules of thumb and the broad water-ducts of theory. From this foundation of an art which is itself of truly spiritual rank, as also of a sympathy and absorption of the same, have arisen the receptivity and freedom which make it possible for us to enjoy and appreciate great works of art which have long since been within our reach, whether it be those of the modern world, of the Middle Ages, or of wholly foreign peoples of the Past, the works of India for example; works, which, in virtue of their antiquity or the remoteness of their nationality, possess unquestionably for ourselves a side alien to ourselves; but which, if we consider the way in which their content passes over and beyond such national limits, and the matter in it of common appeal to all mankind, can only be hallmarked by the prejudice of theory among the products of a barbarous or corrupt taste. This recognition of works of art anywhere and everywhere, works which depart from the specific circle and forms of those upon which in the main the abstractions of theory were based, has, as a primary consequence, led to the recognition of a peculiar type of art — *the romantic art.* It became necessary to apprehend the notion and the nature of the beautiful in a profounder way than these theories attempted. With this fact another, too, cooperated, viz., that the notions in its form of apperception, the mind as pure thought on its part reached in philosophy a point of profounder self-cognition, and was thereby compelled forthwith to grasp the essence of art too on profounder lines. In this way, even in virtue of the point in the

process reached of this general evolution of human thought, the type of theorizing upon art we have described, both relatively to its principles no less than their elaboration, has become obsolete. It is only the *scholarship* of the history of art which retains an abiding value, and must continue to retain it in proportion as the boundaries of its survey have enlarged in every direction by means of the advance made in man's powers of receptivity already noticed. Its business and function consists in the aesthetic appreciation of particular works of art and the knowledge of the historical, in other words the external conditions from which the work of art originates. It is an attitude of the mind, which, if assisted with sound sense and critical insight, supported too with historical knowledge, is an indispensable condition to the complete penetration into the individuality of a given work of art. The many writings of Goethe upon art and works of art are an excellent illustration. Theorizing, in the specific sense noticed, is not the aim of this type of examination, although no doubt it not unfrequently also busies itself with abstract principles and categories, and may drop into such a style unconsciously. If, however, without letting such deviations on our route detain us, we keep before our vision those concrete illustrations of artistic works, such at least, whatever else they may do, supply a philosophy of art with the visible warrant and confirmation of actual work, into the historical detail of which, in each particular case, philosophy is not permitted to enter.

This then may be accepted as the first method of art study. It starts from the particular work which we have before us.

2. The method or point of view to be contrasted with this, in other words an entirely theoretical reflection, which is concerned to cognize the beautiful as such from its own intrinsic wealth, and to penetrate to the idea of it, is essentially distinct from the first method. As is well known, Plato was the first to demand of philosophical inquiry in a profounder sense, that

objects should not be cognized in their *particularity*, but in their *universality*, in their generic type, their essential being and its explicit manifestation. He maintained that this true essence[30] did not consist in *particular* actions which were good, in particular true opinions, handsome men or beautiful works of art, but in *goodness*, *beauty*, and *truth* in their universality. Now if in fact the beautiful ought to be cognized according to its essence and notion, this can only be effected by means of the thinking notion[31], by means of which the logical and metaphysical nature of the *Idea as such*, as also of that of the particular *Idea of the beautiful* enters into the thinking consciousness. But the consideration of the beautiful in its self-independence and its idea may readily once more become an abstract metaphysic; and even though Plato is accepted as founder and pioneer, the Platonic abstraction no longer supplies all we require, not even for the logical Idea of the beautiful. We are bound to grasp this idea more profoundly and more in the concrete. The emptiness of content which clings to the Platonic Idea, no longer satisfies the richer philosophical requirements of the mind to-day. It is no doubt the case that we also in the philosophy of art must make the Idea of the beautiful our starting point; but it is by no means inevitable that we should adhere to the Platonic ideas in their abstraction, ideas from which the philosophy of the beautiful merely dates its origins.

3. The philosophical idea of the beautiful to indicate at any rate its true nature provisionally, must contain both extremes which we have described mediated in itself. It must combine, that is to say, metaphysical universality with the determinate content of real particularity. It is only by this means that it is grasped in its essential no less than explicit truth. For on the one hand it is then, as contrasted with the sterility of one-sided reflection, fruit-bearing out of its own wealth. It is its function, in consonance with its own notion, to develop into a totality of definite qualities, and this essential

conception itself, no less than its detailed explication, comprises the necessary coherence of its particular features as also of the progress and transition of one phase thereof into another. On the other hand, these particulars into which the passage is made essentially carry the universality and essentiality of the fundamental notion, as the particulars of which they appear. The modes of inquiry hitherto discussed lack both these aspects, and for this reason it is only the notion, as above formulated, in its completeness, which conducts us to definitive principles which are substantive, necessary, and self-contained in their completeness.

III

After these preliminaries we come to closer quarters with our actual subject-matter, namely, the philosophy of Fine Art[32]; and for the reason that we are undertaking to treat it scientifically, our commencement must be with the notional concept of the same. It is only after we have definitely ascertained this that we can map out the division of its parts, and with it the plan of the science as a whole. A division of this kind, if it is not to be, as is the case with non-philosophical inquiry, undertaken in a purely external way, must discover its principle in the notion of the subject treated itself.

Face to face with such a demand we are at once met by the question: "Whence do we arrive at such a conception?" If we begin with the notional concept of Fine Art itself the same at once becomes a *pre-supposition* and mere assumption. Mere assumptions, however, are excluded from the philosophical method; whatever here is allowed as valid must have its truth demonstrated, in other words must be established in its necessity.

We will endeavour to arrive at an understanding in a few words in the presence of this difficulty which invariably recurs in the introduction to every course of philosophical study if treated independently. The subject-matter of every science presents in the first instance two aspects for

consideration: first, the fact that a given object *is*; secondly, the question *what* it is.

Upon the question of fact in ordinary scientific inquiry little difficulty is experienced. Indeed it might on a cursory view even appear ridiculous if the demand were made that we had to prove in geometry, for instance, that there were such objects as space, and geometrical figures, or in astronomy and physics that there was a sun, stars, and magnetic phenomena. In these sciences, which are concerned with what is actually presented to sense perception, objects are accepted from objective experience, and so far from it being regarded necessary to demonstrate (*beweisen*) them, it is deemed sufficient to point to (*weisen*) the bare facts. Yet even within the limits of non-philosophical instruction doubts may arise as to the existence of certain objects. In psychology, for example, the science of mind, the doubt is possible whether there *is* a soul, an intelligence, *i.e.*, something distinct from material conditions, something immaterial[33], independent and self-substantive, or in the theology whether a God actually *exists*. Moreover, assuming the objects of the science to be thus immaterial, in other words, merely present in the mind, and not a part of the objective world we perceive, we have to face the possible conviction that there is nothing in the mind, but that which it has evoked in virtue of its own activity. This brings up incidentally the question whether men have produced this idea or intuition which is inward to their minds or not, and even if we do actually accept the first alternative, whether they have not made such an idea once more to vanish, or depreciated, the same at any rate to an idea of wholly *subjective* validity, whose content possesses no independent or self-contained existence[34]. In this way, for example, the beautiful has been frequently regarded as possessing no necessarily essential and independent stability in the world of our ideas; rather it is accepted as a pleasure purely personal to ourselves, due to the caprice of our senses[35]. Even our external

intuitions, observations and perceptions frequently deceive and lead us astray; but still more is this the case with those ideas that do not arise from sense-perception, even though they possess in themselves the greatest vitality, and are able to transport us into passion, we are powerless to resist.

This doubt, then, whether an object of the inward world of our ideas and intuitions actually exists as an independent fact or not, as also that further incidental problem, whether the particular consciousness in question has produced it in itself, and whether the particular mode or process, in which it objectified it to itself, is also adequate to the object thus envisaged in its essential and independent nature — these are precisely the kind of questions which have awakened in men the higher demand of philosophy, which is that, even if there is every appearance that an object is, or that we have before us such an object, yet none the less that object must be expounded or demonstrated on the basis of its necessity. A demonstration of this kind, if developed on truly philosophical lines, ought at the same time to supply a sufficient answer to the question: *What* a given object is. To work this out fully would, however, carry us further than is now possible. We propose to limit ourselves to the following general remarks.

If we are to propound the necessity of our subject-matter, in other words the beauty of art, we are bound to prove that art, or the beautiful, is a result of antecedents such as, when regarded relatively to their true notional concept, conduct us with scientific necessity to the similar notion of fine art itself. Inasmuch as, however, we propose to make art the point of departure, and its idea and the objective presence of the same, and do *not* propose to deal with the antecedent conditions which are essential to the necessary exposition of its notional concept, for this reason art, in our treatment of it as a particular object of scientific inquiry, involves a pre-assumption, which lies outside the boundary of our investigation; which, implying as it does a different content, belongs, as scientifically treated, to another course of

philosophical inquiry. We have therefore now no other alternative than frankly to accept the notional idea of art, so to speak, provisionally[36], which is inevitable with every one of the *particular* philosophical sciences, if regarded in their abstract isolation. For it is the entire body of philosophy, and that alone, which either is or can be the comprehension of the universe as one essentially *single* organic totality; and which, as such a totality, self-evolved from its own notional Idea, and returning into itself so as to form a whole in virtue of the necessary principle in which it is placed relatively to itself, encloses itself, and all that is itself, into one single world of truth. In the coronal of this scientific necessity is every particular member thereof a self-complete circle which returns into itself, while, at the same time, and as imperatively, it possesses a necessary bond of connection with other parts. This bond of coherence is a backward from which it is self-derived, no less than a forward to which it is self-impelled onward, in so far as it fruitfully begets fresh material from its own resources, and renders the same open and pervious to scientific cognition. It is not therefore our purpose to demonstrate the Idea of the beautiful, which is our point of departure, or, in other words, to deduce it in all its necessity from the assumptions which are its antecedents in philosophy, and from the womb of which it is born. This is the object appropriate to an encyclopaedic development of philosophy as a whole and in its specific branches. For ourselves the notional concept of the beautiful and art is a pre-supposition supplied us by the system of philosophy. Inasmuch, however, as we are not prepared to discuss this system, and the association of art with it in the present context[37], we have not as yet the idea of the beautiful before us in a *scientific form*: what we have and are able to deal with are simply the phases and aspects of the same as we find them in the various conceptions of beauty and art of our everyday conscious life, or as they have been conceived by previous writers. Having made our start at this point we shall then at a later stage

pass on to the more fundamental investigation of those views, in order thereby to secure the advantage of, in the first instance, working out a general idea of our subject-matter no less than obtaining a provisional acquaintance, as a result of our necessarily brief criticism, with its higher principles, which will occupy our thoughts in the inquiry which follows[38]. By this means our final introduction[39] will supply a sort of overture to the exposition of the subject itself, and will aim at being a general concatenation and direction of our reflection on the real subject-matter before us. What in the first instance is known to us under current conceptions of a work of art may be subsumed under the three following determinations:

(1) A work of art is no product of Nature. It is brought into being through the agency of man.

(2) It is created essentially *for* man; and, what, is more, it is to a greater-or less degree delivered from a sensuous medium, and addressed to his *senses*[40].

(3) It contains an *end* bound up with it.

1. With regard to the first point, that a work of art is a product of human activity, an inference has been drawn from this (*a*) that such an activity, being the conscious production of an external object can also be *known* and *divulged*, and learned and reproduced by others. For that which one is able to effect, another — such is the notion — is able to effect or to imitate[41], when he has once simply mastered the way of doing it. In short we have merely to assume an acquaintance with the rules of art-production universally shared, and anybody may then, if he cares to do so, give effect to executive ability of the same type, and produce works of art. It is out of reasoning of this kind that the above-mentioned theories, with their provision of rules, and their prescriptions formulated for practical acceptance, have arisen. Unfortunately that which is capable of being

brought into effect in accordance with suggestions of this description can only be something formally regular and mechanical. For only that which is mechanical is of so exterior a type that only an entirely empty effort of will and dexterity is required to accept it among our working conceptions, and forthwith to carry it out; an effort, in fact, which is not under the necessity to contribute out of its own resources anything concrete such as is quite outside the prescriptive power of such general rules.

This is apparent with most vividness when precepts of this kind are not limited to what is purely external and mechanical, but extend their pretensions to the activity of the artist in the sense that implies wealth of significance and intelligence. In this field our rules pass off to purely indefinite generalities, such as "the theme ought to be interesting, and each individual person must speak as is appropriate to his status, age, sex and situation." But if rules are really to suffice for such a purpose their directions ought to be formulated with such directness of detail that, without any further co-operation of mind, they could be executed precisely in the manner they are prescribed. Such rules being, in respect to this content, abstract, clearly and entirely fall short of their pretension of being able to complete[42] the artistic consciousness. Artistic production is not a formal activity in accordance with a series of definitions; it is, as an activity of soul, constrained to work out of its own wealth, and to bring before the mind's eye a wholly other and far richer content, and a more embracing and unique[43] creation than ever can be thus prescribed. In particular cases such rules may prove, of assistance, in so far, that is, as they contain something really definite and consequently useful for practice. But even here their guidance will only apply to conditions wholly external.

(*b*) This above indicated tendency has consequently been wholly given up; but writers in doing so have only fallen as unreservedly into the opposite extreme. A work of art came to be looked upon, and so far rightly,

as no longer the product of an activity *shared by all men*, but rather as a creation of a mind gifted in an extraordinary degree. A mind of this type has in this view *merely* to give free vent to its peculiar endowment, regarded as a specific natural power. It has to free itself absolutely from a pursuit of rules of universal application, as also from any admixture of conscious reflection with its creative and, as thus viewed, wholly instinctive powers, or rather it should be on its guard therefrom, the assumption being that such an exercise of conscious thought can only act on its creations as an infection and a taint. Agreeably to such a view the work of art has been heralded as the product of *talent* and *genius*; and it is mainly the aspect of natural gift inseparable from the ordinary conception of talent and genius, which has been emphasized. There is to some extent real truth in this. Talent is specific, genius universal capacity. With neither[44] of these can a man endow himself *simply* by the exercise of his self-conscious activity. We shall consider this at greater length in a subsequent chapter[45].

In the present context we would merely draw attention to the false assumption in this view that in artistic production every kind of self-reflection upon the artist's own activity was regarded as not merely superfluous, but actually injurious. In such a view the process of creation by talent or genius simply is taken to be a general *state*; or we may define it more precisely as a condition of inspiration. To such a condition, it is said, genius is in some measure exalted by the subject-matter itself; it is also to some extent voluntarily able to place itself under such a condition, a process of self-inhibition in which the genial service of the champagne bottle is not forgotten[46]. An idea of this kind was in vogue during the so-called "Epoch of Genius," which originated with the early poetical work of Goethe, receiving subsequent illustration in those of Schiller. These poets by their rejection of all rules hitherto fabricated made as it were an entirely new start; with deliberate intention they ran counter to such rules, and while

doing so distanced all competitors by many lengths. I do not, however, propose to discuss with more detail the confusions which have prevailed over the conception of inspiration and genius, and the notion, which even at the present day finds advocates, that inspiration simply by itself can effect anything and everything. The real and indeed sole point to maintain as essential is the thesis that although artistic talent and genius essentially implies an element of natural power, yet it is equally indispensable that it should be thoughtfully cultivated, that reflection should be brought to bear on the particular way it is exercised, and that it should be also kept alive with use and practice in actual work. The fact is that an important aspect of the creating process is merely facility in the use of a medium[47]; that is to say, a work of art possesses a purely technical side, which extends to the borders of mere handicraft. This is most obviously the case in architecture and sculpture, less so in painting and music, least of all in poetry. A facility here is not assisted at all by inspiration; what solely indispensable is reflection, industry, and practice. Such technical skill an artist simply *must* possess in order that he may be master over the external material, and not be thwarted by its obstinacy.

Add to this that the more exalted the rank of an artist the more profoundly ought he to portray depths of soul and mind; and these are not to be known by flashlight, but are exclusively to be sounded, if at all, by the direction of the man's own intelligence on the world of souls and the objective world. In this respect, therefore, once more *study* is the means whereby the artist brings to consciousness such a content, and appropriates the material and structure of his conceptions. At the same time no doubt one art will require such a conscious reception and cognitive mastery of the content in question more than another. Music, for example, which has exclusively to deal with the entirely undefined motion of the soul within, with the musical tones of that which is, relatively, feeling denuded of

positive thought, has little or no need to bring home to consciousness the substance of intellectual conception[48]. For this very reason musical talent declares itself as a rule in very early youth, when the head is still empty and the emotions have barely had a flutter; it has, in fact, attained real distinction at a time in the artist's life when both intelligence and life are practically without experience. And for the matter of that we often enough see very great accomplishment in musical composition and execution hung together with considerable indigence of mind and character. It is quite another matter in the case of poetry. What is of main importance here is a presentation of our humanity rich in subject-matter and reflective power, of its profounder interests, and of the forces which move it. Here at least mind and heart must themselves be richly and profoundly disciplined by life, experience, and thought before genius itself can bring into being the fruit that is ripe, the content that has substance, and is essentially consummate. The early productions of Goethe and Schiller are characterized by an immaturity, we may even call it a rawness and barbarity, which really are appalling. This phenomenon, that in the majority of those experiments we find a preponderating mass of features which are absolutely prosaic, or at least uninspired and commonplace, is a main objection to the ordinary notion that inspiration is inseparable from youth and its sirocco season. These two men of genius were the first beyond question to give our nation true works of poetry, are, in fact, our national poets; but for all that it was only their mature manhood, which made it a present of creations profound, sterling of their kind, creations of genuine inspiration, and no less technically complete in their artistic form[49]. We naturally recall the case of the veteran Homer, who only composed and uttered his immortal songs in his old age.

(*c*) A third view, held relatively to the idea of a work of art as a product of human activity, concerns the position of such towards the phenomena of

Nature. The natural tendency of ordinary thinking in this respect is to assume that the product of human art is of *subordinate* rank to the works of Nature. The work of art possesses no feeling of its own; it is not through and through a living thing, but, regarded as an external object, is a dead thing. It is usual to regard that which is alive of higher worth than what is dead. We may admit, of course, that the work of art is not in itself capable of movement and alive. The living, natural thing is, whether looked at within or without, an organization with the life-purpose of such worked out into the minutest detail. The work of art merely attains to the show of animation on its surface. Below this it is ordinary stone, wood, or canvas[50], or in the case of poetry idea, the medium of such being speech and letters. But this element of external existence is not that which makes a work a creation of fine art. A work of art is only truly such in so far as originating in the human spirit, it continues to belong to the soil from which it sprang, has received, in short, the baptism of the mind and soul of man, and only presents that which is fashioned in consonance with such a sacrament. An interest vital to man, the spiritual values which the single event, one individual character, one action possesses in its devolution and final issue, is seized in the work of art and emphasized with greater purity[51] and clarity than is possible on the ground of ordinary reality where human art is not. And for this reason the work of art is of higher rank than any product of Nature whatever, which has not submitted to this passage through the mind. In virtue of the emotion and insight, for example, in the atmosphere of which a landscape is portrayed by the art of painting, this creation of the human spirit assumes a higher rank than the purely natural landscape. Everything which partakes of spirit is better than anything begotten of mere Nature. However this may be, the fact remains that no purely natural existence is able, as art is, to represent divine ideals.

And further, all that the mind borrows from its own ideal content it is able, even in the direction of external existence, to endow with *permanence.* The individual living thing on the contrary is transitory; it vanishes and is unstable in its external aspect. The work of art persists. At the same time it is not mere continuation, but rather the form and pressure thereon of the mintage of soul-life which constitutes its true pre-eminence as contrasted with Nature's reality.

But this higher position we have thus assigned to the work of art is yet further contested by another prevalent conception of ordinary ideas. It is contended that Nature and all that proceeds from her are a work of God, created by His goodness and wisdom. The work of art is on the contrary *merely* a human product fashioned by human hands according to human design. The fallacy implied in this contrast between the products of Nature viewed as a divine creation and human activity as of wholly finite energy consists in the apparent assumption that God is not operative in and through man, but limits the sphere of His activity to Nature alone. We must place this false conception entirely on one side if we are desirous of penetrating to the true idea of art; or rather, as opposed to such a conception we ought to accept the extreme opposite thereto, namely, that God is more honoured by that which mind makes and creates than by everything brought into being and fashioned in the natural process. For not only is there a divinity in man, but it is actually effective in him in a form which is adequate to the essential nature of God in a far higher degree than in the work of Nature. God is a Spirit, and it is only in man that the medium, through which the Divine passes, possesses the form of spirit fully conscious of the activity in which it manifests its ideal presence. In Nature the medium correspondent to this is the unconscious sensuous[52] and external *materia*, which is by many degrees inferior to consciousness in its worth. In the products of art God works precisely as He works through the phenomena of Nature. The divine

substance, however, as it is asserted in the work of art has secured, being begotten of spirit life itself, a highway commensurable to its existence; determinate existence in the unconscious sensuousness of Nature is not a mode of appearance adequate to the Divine Being.

(*d*) Assuming, then, that the work of art is a creation of man in the sense that it is the offspring of mind or spirit we have still a further question in conclusion, which will help us to draw a more profound inference still from our previous discussion. That question is, "What is the human *need* which stimulates art-production?" On the one hand the artistic activity may be regarded as the mere play of accident, or human conceits, which might just as well be left alone as attempted. For, it may be urged, there are other and better means for carrying into effect the aims of art, and man bears within himself higher and more weighty interests, than art is capable of satisfying. In contrast to such a view art appears to originate in a higher impulse, and to satisfy more elevated needs, nay, at certain times the highest and most absolute of all, being, as it has been, united to the most embracing views of entire epochs and nations upon the constitution of the world and the nature of their religion.

This inquiry, however, concerning a necessity for art which shall not be merely contingent, but absolute, we are not as yet able to answer with completeness; it demands, in fact, a concreter mode of exposition than is compatible with the form of this introduction. We must accordingly deem it sufficient for the present merely to establish the following points.

The universal and absolute want from which art on its side of essential form[53] arises originates in the fact that man is a *thinking* consciousness, in other words that he renders explicit *to himself* and from his own substance[54], what he is and all in fact that exists. The objects of Nature exist exclusively in immediacy and *once for all.*[55] Man, on the contrary, as mind *reduplicates* himself. He is, to start with, an object of Nature as other objects; but in

addition to this, and no less truly, he exists *for himself*; he observes himself, makes himself present to his imagination and thought, and only in virtue of this active power of self-realization is he actually mind or spirit. This consciousness of himself man acquires in a twofold way; in the *first* instance *theoretically.* This is so in so far as he is under a constraint to bring himself in his own inner life to consciousness — all which moves in the human heart, all that surges up and strives therein — and generally, so far as he is impelled to make himself an object of perception and conception, to fix for himself definitively that which thought discovers as essential being, and in all that he summons out of himself, no less than in that which is received from without, to recognize only himself. And *secondly*, this realization is effected through a *practical* activity. In other words man possesses an impulse to assert himself in that which is presented him in immediacy, in that which is at hand as an external something to himself, and by doing so at the same time once more to recognize himself therein. This purpose he achieved by the alteration he effects in such external objects, upon which he imprints the seal of his inner life, rediscovering in them thereby the features of his own determinate nature. And man does all this, in order that he may as a free agent divest the external world of its stubborn alienation from himself — and in order that he may enjoy in the configuration of objective fact an external reality simply of himself. The very first impulse of the child implies in essentials this practical process of deliberate change in external fact. A boy throws stones into the stream, and then looks with wonder at the circles which follow in the water, regarding them as a result in which he sees something of his own doing. This human need runs through the most varied phenomena up to that particular form of self-reproduction in the external fact which is presented us in human art. And it is not merely in relation to external objects that man acts thus. He treats himself, that is, his natural form, in a similar manner: he will not

permit it to remain as he finds it; he alters it deliberately. This is the rational ground of all ornament and decoration, though it may be as barbarous, tasteless, entirely disfiguring, nay, as injurious as the crushing of the feet of Chinese ladies, or the slitting of ears and lips. For it is among the really cultured alone that a change of figure, behaviour, and every mode and manner of self-expression will issue in harmony with the dictates of mental elevation[56].

This universal demand for artistic expression[57] is based on the rational impulse in man's nature to exalt both the world of his soul experience and that of Nature for himself into the conscious embrace of mind as an object in which he rediscovers himself. He satisfies the demand of this spiritual freedom by making explicit to, his *inner* life all that exists, no less than from the further point of view giving a realized *external* embodiment to the self made thus explicit. And by this reduplication of what is his own he places before the vision and within the cognition of himself and others what is within him. This is the free rationality of man, in which art as also all action and knowledge originates. We shall investigate at a later stage the specific need for art as compared with that for other political and ethical action, or that for religious ideas and scientific knowledge.

2. We have hitherto considered the work of art under the aspect that it is fashioned by man; we will now pass over to the second part of our definition, that it is produced for his *sense-apprehension*, and consequently is to a more or less degree under obligations to a sensuous medium.

(*a*) This reflection has been responsible for the inference that the function of fine art is to arouse feeling, more precisely the feeling which suits us — that is, pleasant feeling. From such a point of view writers have converted the investigation of fine art into a treatise on the emotions and asked what kind of feelings art ought to excite — take fear, for example, and compassion — with the further question how such can be regarded as

pleasant, how, in short, the contemplation of a misfortune can bring satisfaction. This tendency of reflection dates for the most part from the times of Moses Mendelssohn, and many such trains of reasoning may be found in his writings. A discussion of this kind, however, did not carry the problem far. Feeling is the undefined obscure region of spiritual life. What is felt, remains cloaked in the form of the separate personal experience under its most abstract persistence[58]; and for this reason the distinctions of feeling are wholly abstract; they are not distinctions which apply to the subject-matter itself. To take examples — fear, anxiety, care, dread, are of course one type of emotion under various modifications; but in part they are purely quantitative degrees of intensity, and in part forms which reflect no light, on their content itself, but are indifferent to it. In the case of fear, for instance, an existence is assumed, for which the individual in question possesses an interest, but sees at the same time the negative approach which threatens to destroy this existence, and thereupon discovers in immediate fusion within himself the above interest and the approach of that negative as a contradictory affection of his personal life. A fear of this sort, however, does not on its own account condition any particular content; it may associate with itself subject-matter of the most opposed and varied character. The feeling merely as such is in short a wholly empty form of a subjective state. Such a form may no doubt in certain cases itself be essentially complex, as we find it is with hope, pain, joy, and pleasure; it may also in this very complexity appropriate various modes of content, as, for example, we have a feeling of justice, an ethical feeling, a sublime religious feeling, and so forth; but despite the fact that a content of this kind is present in different modes of feeling, no light whatever is thereby thrown on such content which will disclose its essential and definite character. The feeling throughout remains a purely subjective state which belongs to me, one in which the concrete fact vanishes, as though contracted to a vanishing

point in the most abstract of all spheres[59]. For this reason an inquiry over the nature of the emotions which art ought or ought not to arouse, comes simply to a standstill in the undefined; it is an investigation which deliberately abstracts from genuine content and its concrete substance and notion. Reflection upon feeling is satisfied with the observation of the personal emotional state and its singularity, instead of penetrating and sounding the matter for study, in other words the work of art, and in doing so bidding good-bye to the wholly subjective state and its conditions. In feeling, however, it is just this subjective state void of content which is not merely accepted, but becomes the main thing; and that is precisely why people are so proud of having emotions. And for no other reason that is why such an investigation is tedious owing to its indefinite nature and emptiness, and even repellent in its attention to trivial personal idiosyncrasies.

(*b*) Inasmuch, however, as the work of art is not merely concerned with exciting some kind of emotion or other — for this is an object it would share without any valid distinction with eloquence, historical composition, religious edification and much else — but is only a work of art in so far as it is beautiful, it occurred to reflective minds to discover a *specific feeling for beauty*, and a distinct *sense faculty* correspondent with it. In such an inquiry it soon became clear that a sense of this kind was no definite and mere[60] instinct rigidly fixed by Nature, which was able by itself and independently to distinguish the beautiful. As a consequence the demand was made for *culture* as a condition precedent to such a sense, and the sense of beauty as thus cultivated was called *taste*, which, albeit an instructed apprehension and discovery of the beautiful, was none the less assumed to persist in the character of immediate feeling. We have already discussed the way in which abstract theory attempted to form such a sense of taste, and how external and one-sided that sense remained. While the critical sense generally of the time when such ideas were in currency was lacking in the

universality of its principles, as a *specific* critique of particular works of art it was less concerned to substantiate a judgment *more decisive* than hitherto — indeed the material to effectuate this was not as yet forthcoming — than to promote in a general way the *cultivation* of such a taste[61]. Consequently this educative process also came to a halt in the region of the more indefinite, and merely busied itself by its reflections in the fitting out of feeling as a sense of beauty in such a way that beauty could immediately be discovered whenever and wherever it might chance to appear. The real depth of the subject-matter remained notwithstanding a closed book to such a taste. Profundity of this kind demands not merely sensitive reception and abstract thought, but the reason in its concrete grasp and the most sterling qualities of soul-life. Taste on the contrary is merely directed to the outside surfaces, which are the playground of the feelings, and upon which one-sided principles may very well pass, as currency. But for this very reason our so-called good taste is scared by every kind of profounder artistic effect, and is dumb where the ideal significance[62] is in question, and all mere externalities and accessories vanish. For when great passions and the movements of a profound soul assert themselves, we do not bother ourselves any more with the finer distinctions of taste and its retail traffic in trifles. It is[63] conscious that genius leaves such ground far behind it in its stride; and shrinking before that power feels on its part far from comfortable, not knowing very well which way to turn.

(*c*) Thus it is the further change has come about that critics of art-production no longer have an eye simply to the education of taste, or are intent upon the illustration of such a sense. The *connoisseur*, or art-scholar, has taken the place of the man, or judge of artistic taste. The positive side of art-scholarship, in so far as it implies a sound and exhaustive acquaintance with the entire embrace of what is distinctive and peculiar in a given work of art, we have already maintained to be a necessary condition of artistic

research. A work of art, owing to its nature, which, if it is material from one point of view, is also related to a particular person, originates from specific conditions of the most varied kind, among which as exceptionally important we may mention the date and place of its origins, the characteristic personality of the artist, and, above all, the degree of executive accomplishment secured by the art. All these points of view have to be taken into consideration if we wish to obtain a view and knowledge of such a work which is clear in its outlines, and founded on a true basis, nay, even wish to enjoy it rightly. It is with these that our art-scholarship is mainly occupied; and all that it can do for us in this way should be gratefully accepted. Though it is quite true such art-scholarship must be reckoned as of essential importance, it ought not to be regarded as the sole, or indeed the highest, constituent in the relation of the contemplative spirit to a work of art and art generally. Such art-scholarship (this is the defective tendency) may restrict itself wholly to a knowledge of purely external characteristics, either on the side of technique or historical condition, or in other directions; it may continue to possess the barest inkling of the true nature of a given work, or simply no knowledge at all. It may even form a depreciatory verdict on the value of profounder inquiries as compared with purely matter of fact, technical, and historical knowledge. Yet even so an art-scholarship, assuming it to be really genuine and thorough, at least proceeds upon grounds and knowledge which are definite, and an intelligent judgment; and it is association with such that our more accurate review of the distinct, if also to some extent exterior, aspects of a work of art, and our estimate of their relative significance, is secured.

(*d*) Following the above observations upon the modes of inquiry which were suggested by that aspect of a work of art in which, as itself an object with a material medium, it possessed an essential relation to man as himself receptive through sense, we will now examine this point of view in its more

essential connection with art itself. We propose to do this partly (α) in respect to the art-product viewed as an object, partly (β) as regards the personal characteristics of the artist, his genius, talent, and so forth. We do not, however, propose to enter into matter which can in this connection exclusively proceed from the knowledge of art according to its universal concept[64]. The truth is we are not as yet in the full sense on scientific ground; we have merely reached the province of external reflection.

(α) There is no question, then, that a work of art is presented to sensuous apprehension. It is submitted to the emotional sense, whether outer or inner, to sensuous perception and the imaged sense, precisely as the objective world is so presented around us, or as is our own inward sensitive nature. Even a speech, for example, may be addressed to the sensuous imagination and feeling. Notwithstanding this fact, however, the work of art is not exclusively directed to the *sensuous* apprehension, viewed, that is, as an object materially conditioned. Its position is of the nature, that along with its sensuous presentation it is fundamentally addressed to the *mind.* The mind is intended to be affected by it and to receive some kind of satisfaction in it.

This function of the work of art at once makes it clear how it is that it is in no way intended to be a natural product or, on the side where it impinges on Nature, to possess the living principle of Nature. This, at least, is a fact whether the natural product is ranked lower or higher than a *mere* work of art, as people are accustomed to express themselves in the tone of depreciation.

In other words the sensuous aspect of a work of art has a right to determinate existence only in so far as it exists for the human mind, not, however, in so far as itself, as a material object, exists for itself independently.

If we examine more closely in what way the sensuous *materia* is presented to man we find that what is so can be placed under various relations to the mind.

(αα) The lowest in grade and that least compatible with relation to intelligence is purely sensuous sensation. It consists primarily in mere looking, listening, just as in times of mental overstrain it may often be a relaxation to go about without thought, and merely listen and have a look round. The mind, however, does not rest in the mere apprehension of external objects through sight and hearing; it makes them objective to its own inward nature, which thereupon, is impelled itself to give effect to itself in these things as a further step under a sensuous mode, in other words, it relates itself to them as *desire.* In this appetitive relation to the external world man, as a sensuous[65] particular thing, stands in a relation of opposition, to things in general as in the same way particulars. He does not address himself to them with open mind and the universal ideas of thought; he retains an isolated position, with its personal impulses and interests, relatively to objects as fixed in their obduracy as himself, and makes himself at home in them by using them, or eating them up altogether, and, in short, gives effect to his self-satisfaction by the sacrifice he makes of them. In this negative relation desire requires for itself not merely the superficial show of external objects, but the actual things themselves in their material concrete existence. Mere pictures of the wood, which it seeks to make use of, or of the animals, which it hopes to eat up, would be of no service to desire. Just as little is it possible for desire to suffer the object to remain in its freedom; its craving is just this to force it to annihilate this self-subsistency and freedom of external facts, and to demonstrate that these things are only there to be destroyed and devoured. But at the same time the particular person is neither himself free, begirt as he is by the particular limited and transitory interests of his desires, for his definite acts do not

proceed from the essential universality and rationality of his will, neither is he free relatively to the external world, for desire[66] remains essentially determined by things and related to them.

This relation, then, of desire is not that in which man is related to the work of art. He suffers it to exist in its free independence as an object; he associates himself with it without any craving of this kind, rather as with an object reflective of himself[67], which exists solely for the contemplative faculty of mind. For this reason, as we have said, the work of art, although it possesses sensuous existence, does not require sensuous concrete existence, nor yet the animated life of such objects. Or, rather, we should add, it *ought* not to remain on such a level, in so far as its true function is exclusively to satisfy spiritual interests, and to shut the door on all approach to mere desire. Hence we can understand how it is that practical desire rates the particular works of Nature in the organic or inorganic world, which are at its service, more highly than works of art, which are obviously useless in this sense, and only contribute enjoyment to other capacities of man's spirit.

(ββ) A second mode under which the externally present comes before the conscious subject is, as contrasted with the single sensuous perception and active desire, the purely theoretical relation to the *intelligence.* The theoretic contemplation of objects has no interest in consuming the same in their particularity and satisfying or maintaining itself through the sense by their means; its object is to attain a knowledge of them in their *universality*, to seek out their ideal nature and principle, to comprehend them according to their notional idea. Consequently this contemplative interest is content to leave the particular things as they are, and stands aloof from them in their objective singularity, which is not the object of such a faculty's investigation. For the rational intelligence is not a property of the particular person in the sense that desire is so; it appertains to his singularity as being itself likewise essentially universal. So long as it persists in this relation of

universality to the objects in question, it is his reason in its universal potency which is attempting to discover *itself* in Nature, and thereby the inward or essential being of the natural objects, which his sensuous existence does not present under its mode of immediacy, although such existence is founded therein. This interest of contemplation, the satisfaction of which is the task of *science*, is, however, shared in this scientific form just as little by art as it shared in the common table of those impulses of the purely practical desire. Science can, it is true, take as its point of departure the sensuous thing in its singularity, and possess itself of some conception, how this individual thing is present in its specific colour or form. But for all that this isolated thing of sense as such possesses no further relation to mind, inasmuch as the interest of intelligence makes for the universal, the law, the thought and notion of the object, and consequently not only does it forsake it in its immediate singularity, but it actually transforms it within the region of idea[68], converting a concrete object of sense into an abstract subject-matter of thought, that is converting it into something other than the same object of its sensuous perception actually was. The artistic interest does not follow such a process, and is distinct from that of science for this reason. The contemplation of art restricts its interest simply in the way in which the work of art, as external object, in the directness of its definition, and in the singularity wherein it appears to sense, is manifested in all its features of colour, form, and sound, or as a single isolated vision of the whole; it does not go so far beyond the immediately received objective character as to propose, as is the case with science, the ideal or conceptive thinking of this particular objectivity under the terms of the rational and universal notion which underlies it.

The interest of art, therefore, is distinguishable from the practical interest of desire in virtue of the fact that it suffers its object to remain in its free independence, whereas desire applies it, even to the point of destruction, to

its own uses. The contemplation of art, on the other hand, differs from that of a scientific intelligence in an analogous way[69] in virtue of the fact that it cherishes an interest for the object in its isolated existence, and is not concerned to transform the same into terms of universal thought and notion.

(γγ) It follows, then, that, though the sensuous *materia* is unquestionably present in a work of art, it is only as surface or *show* of the sensuous that it is under any necessity to appear. In the sensuous appearance of the work of art it is neither the concrete material stuff, the empirically perceived completeness and extension of the internal organism which is the object of desire, nor is it the universal thought of pure ideality, which in either case the mind seeks for. Its aim is the sensuous presence, which, albeit suffered to persist in its sensuousness, is equally entitled to be delivered from the framework of its purely material substance. Consequently, as compared with the immediately envisaged and incorporated object of Nature, the sensuous presence in the work of art is transmuted to mere semblance or *show*, and the work of art occupies a midway ground, with the directly perceived objective world on one side and the ideality of pure thought on the other. It is not as yet pure thought, but, despite the element of sensuousness which adheres to it, it is no longer purely material existence, in the sense at least that stones, plants, and organic life are such. The sensuous element in a work of art is rather itself somewhat of ideal intension[70], which, however, as not being actually the ideal medium of thought, is still externally presented at the same time as an object. This semblance of the sensuous presents itself to the mind externally as the form, visible appearance, and harmonious vibration of things. This is always assuming that it suffers the objects to remain in their freedom as objective facts, and does not seek to penetrate into their inward essence by abstract thought, for by doing so they would (as above explained) entirely cease to exist for it in their external singularity.

For this reason the sensuous aspect of art is only related to the two *theoretical*[71] senses of *sight* and *hearing*; smell, on the other hand, taste, and the feeling of touch are excluded from the springs of art's enjoyment. Smell, taste, and touch come into contact with matter simply as such[72], and with the immediate sensuous qualities of the same; smell with the material volatization through the air; taste with the material dissolution of substance, and touch or mere bodily feeling with qualities such as heat, coldness, smoothness, and so forth. On this account these senses cannot have to do with the objects of art, which ought to subsist in their actual and very independence, admitting of no purely sensuous or rather physical relation. The pleasant for such senses is not the beauty of art. Thus art on its sensuous side brings before us deliberately merely a shadow-world of shapes, tones, and imaged conceptions[73], and it is quite beside the point to maintain that it is simply a proof of the impotence and limitations of man that he can only present us with the surface of the physical world, mere *schemata*, when he calls into being his creative works. In art these sensuous shapes and tones are not offered as exclusively for themselves and their form to our direct vision. They are presented with the intent to secure in such shape satisfaction for higher and more spiritual interests, inasmuch as they are mighty to summon an echo and response in the human spirit evoked from all depths of its conscious life. In this way the sensuous is *spiritualized* in art, or, in other words, the life of *spirit* comes to dwell in it under sensuous guise.

(β) For this reason, however, a product of art is only possible in so far as it has received its passage through the mind, and has originated from the productive activity of mind. This brings us to another question we have to answer, and it is this: "How is the sensuous or material aspect, which is imperative as a condition of art, operative in the artist as conjoined to his personal productive activity[74]?" Now this mode or manner of artistic

production contains, as an activity personal to the artist, in essentials just the same determinants which we found posited in the work of art. It must be a spiritual activity, which, however, at the same time possesses in itself the element of sensuousness and immediacy. It is neither, on the one hand, purely mechanical work, such as is purely unconscious facility in sleight of hand upon physical objects, or a stereotyped activity according to teachable rule of thumb; nor, on the other hand, is it a productive process of science, which tends to pass from sensuous things to abstract ideas and thoughts, or is active exclusively in the medium of pure thought. In contrast to these the two aspects of mental idea and sensuous material must in the artistic product be united. For example, it would be possible in the case of poetical compositions to attempt to embody what was the subject-matter in the form of prosaic thought in the first instance, and only after doing so to attach to the same imaginative ideas rhymes and so on, so that as a net result such imagery would be appendent to the abstract reflections as so much ornament and decoration. An attempt of this kind, however, could only lead us to a poor sort of poetry, for in it we should have operative a twofold kind of activity in its *separation*, which in the activity of genuine artistic work only holds good in inseparable unity. It is this true kind of creative activity which forms what is generally described as the artistic *imagination*. It is the rational element, which in its import as spirit only exists, in so far as it actively forces its way into the presence of consciousness, yet likewise, and only subject to this condition, displays all its content to itself under a sensuous form. This activity possesses therefore a spiritual content, but it clothes the same in sensuous image, and for this reason that it is only able to come to a knowledge of the same under this sensuous garb. We may compare such a process with that of a man of experience in life, a man, shall we add, of real geniality and wit, who — while at the same time being fully conscious in what the main importance of life consists, what are the

things which essentially bind men together, what moves them and is the mainspring of their lives — nevertheless has neither brought home this content in universal maxims, nor indeed is able to unfold it to others in the generalities of the reflective process, but makes these mature results of his intelligence without exception clear to himself and others in particular cases, whether real or invented, or by examples and such like which hit the mark. For in the ideas of such a man everything shapes itself into the concrete image determinate in its time and place, to which therefore the addition of names and any other detail of external condition causes no difficulty. Yet such a kind of imagination rather rests on the recollection of conditions, he has lived through, actual experience, than it is a creative power of itself. Memory preserves and renews the particularity and external fashion of such previous events with all their more distinct circumstances, but on the other hand does not suffer the universal to appear independently. The creative imagination of an artist is the imagination of a great mind and a big heart; it is the grasp and excogitation of ideas and shapes, and, in fact, nothing less than this grasp of the profoundest and most embracing human interests in the wholly definite presentation of imagery borrowed from objective experience. A consequence of this is, that imagination of this type[75] is based in a certain sense on a natural gift, a general talent for it, as we say, because its creative power essentially implies an aspect of sense presentation. It is no doubt not unusual to speak in the same way of scientific "talent." The sciences, however, merely presuppose the general capacity for thought, which does not possess, as imagination does, together with its intellectual activity, a reference to the concrete testimony of Nature, but rather precisely abstracts from the activity that form in which we find it in Nature. It would be, therefore, truer to the mark if we said there is no specific scientific talent in the sense of a purely natural endowment. Imagination[76], on the other hand, combines within it a mode of instinct-like

creativeness. In other words the essential plasticity and material element in a work of art is subjectively present in the artist as part of his native disposition and impulse[77], and as his unconscious activity belongs in part to that which man receives straight from Nature. No doubt the entire talent and genius of an individual is not wholly exhausted by that we describe as natural capability. The creation of art is quite as much a spiritual and self-cognized process; but for all that we affirm that its spirituality contains an element of plastic or configurative facility which Nature[78] confers on it. For this reason, though almost anybody can reach a certain point in art, yet, in order to pass beyond this — and it is here that the art in question really begins — a talent for art which is inborn and of a higher order altogether is indispensable.

Considered simply as a natural basis a talent of this kind asserts itself for the most part in early youth, and is manifested in the restless persistency, ever intent with vivacity and alertness, to create artistic shapes in some particular sensuous medium, and to make this mode of expression and utterance the unique one or the one of main importance and most suitable. And thus also a virtuosity up to a certain point in the technique of art which is arrived at with ease is a sign of inborn talent. A sculptor finds everything convertible into plastic shape, and from early days takes to modelling clay; and so on generally whatever men of such innate powers have in their minds, whatever excites and moves their souls, becomes forthwith a plastic figure, a drawing, a melody, or a poem.

(*γ*) Thirdly, and in conclusion: the *content* of art is also in some respects borrowed from the objective world perceived in sense, that is Nature; or, in any case, if the content is also of a spiritual character, it can only be grasped in such a way, that the spiritual element therein, as human relations, for example, are displayed in the form of phenomena which possess objective reality.

3. There is yet another question to solve, namely, what the interest or the *End* is, which man proposes to himself in the creation of the content embodied by a work of art. This was, in fact, the third point of view, which we propounded relatively to the art-product. Its more detailed discussion will finally introduce us to the true notional concept of art itself.

If we take a glance at our ordinary ideas on this subject, one of the most prevalent is obviously

(*a*) The principle of the imitation of Nature. According to this view the essential aim or object of art consists in imitation, by which is understood a facility in copying natural forms as present to us in a manner which shall most fully correspond to such facts. The success of such an exact representation of Nature is assumed to afford us complete satisfaction.

(*α*) Now in this definition there is to start with absolutely nothing but the formal aim to bring about the bare repetition a second time by man, so far as his means will permit of this, of all that was already in the external world, precisely too in the way it is there. A repetition of this sort may at once be set down as

(*αα*) A *superfluous* task for the reason that everything which pictures, theatrical performances represent by way of imitation — animals, natural scenery, incidents of human life — we have already elsewhere before us in our gardens or at home, or in other examples of the more restricted or extended reaches of our personal acquaintance. Looked at, moreover, more closely, such a superfluity of energy can hardly appear otherwise than a presumptuous trifling; it is so because

(*ββ*) It lags so far behind Nature. In other words art is limited in its means of representation. It can only produce one-sided illusions, a semblance, to take one example, of real fact addressed exclusively to *one* sense. And, moreover, if it does wholly rely on the bare aim of *mere* imitation, instead of Nature's life all it gives us ever is the mere pretence of

its substance. For some such reason the Turks, who are Mohammedans, will not put up with any pictures or copies of men and other objects. When James Bruce, in his travels through Abyssinia, showed a painted fish to a Turk, that worthy was at first astonished; but, quickly recovering himself, he made answer as follows: “If this fish shall rise up against you at the last day, and say, ‘You have certainly given me a body, but no living soul,’ how are you going to justify yourself against such a complaint?” The prophet himself, moreover, if we may believe the Sunna, said to the two women Ommi Hubiba and Ommi Selma, who told him of certain pictures in the Aethiopian churches: “These pictures will rise up in judgment against their creators on the Last Day.” There are, no doubt, no less examples of completely deceptive imitation. The painted grapes of Zeuxis, have been accepted from antiquity and long after as an instance of art’s triumph, and also of that of the principle of imitation, because, we are told, actual doves pecked at them. We might add to this ancient example that more modern one of Bültner’s monkey, which bit to pieces a painted cockchafer in Rösel’s “Diversions of Insects,” and was consequently forgiven by his master, although he destroyed by this means a fine copy of the precious work, because he proved thus the excellence of its illustrations. But if we will only reflect a moment on such and other instances we can only come to the conclusion that instead of praising works of art, because they have deceived *even* doves and monkeys, the foolish people ought to be condemned who imagine that the quality of a work of art is enhanced if they are able to proclaim an effect of the same so miserable as the supreme and last word they can say for it. In short, to sum up, we may state emphatically that in the mere business of imitation art cannot maintain its rivalry with Nature, and if it makes the attempt it must look like a worm which undertakes to crawl after an elephant.

(*γγ*) Having regard, then, to this invariable failure, that is, relative failure of human imitation as contrasted with the natural prototype, we have no end left us but the pleasure offered by sleight of hand in its effort to produce something which resembles Nature. And it is unquestionably a fact that mankind are able to derive enjoyment from the attempt to reproduce with their individual labour, skill, and industry what they find around them. But a delight and admiration of this kind also becomes, if taken alone[79], indeed just in proportion as the copy follows slavishly the thing copied, so much the more icily null and cold, or brings its reaction of surfeit and repugnance. There are portraits which, as has been drily remarked, are positively shameless in their likeness[80]; and Kant brings forward a further example of this pleasure in imitation pure and simple to the effect that we are very soon tired of a man — and there really are such — who is able to imitate the nightingale's song quite perfectly; for we no sooner find that it is a man who is producing the strain than we have had enough of it. We then take it to be nothing but a clever trick, neither the free outpouring of Nature, nor yet a work of art. We expect, in short, from the free creative power of men something quite other than a music of this kind, which only retains our interest when, as in the case of the nightingale's note, it breaks forth in unpremeditated fashion, resembling in this respect the rhythmic flood of human feeling, from the native springs of its life. And as a general rule this delight we experience in the skill of imitation can only be of a restricted character; it becomes a man better to derive enjoyment from that which he brings to birth from himself. In this respect the invention of every insignificant technical product is of higher rank; and mankind may feel more proud at having invented the hammer, nail, and so forth, than in making themselves adepts as imitators. For this abstract zest in the pursuit of imitation is on the same lines as the feat of the man who had taught himself to throw lentils through a small aperture without missing. He made

an exhibition of this feat to Alexander, and Alexander merely made him a present as a reward for this art, empty and useless as it was, of a bushel of lentils.

(β) Inasmuch as, moreover, the principle of imitation is purely formal, *objective beauty* itself disappears, if that principle is accepted as the end. For the question is then no longer what is the *constitution* of that which is to be imitated, but simply whether the copy is *correct* or no. The object and the content of the beautiful comes to be regarded as a matter of indifference. When, in other words, putting the principle of mere imitation on one side, we speak, in connection with animals, human beings, places, actions, and characters, of a distinction between beauty and ugliness, it remains none the less the fact that relatively to such a principle we are referring to a distinction which does not properly belong to an art for which we have appropriated this principle of imitation to the exclusion of all others. In such a case, therefore, whenever we select objects and attempt to distinguish between their beauty and ugliness, owing to this absence of a standard we can apply to the infinite forms of Nature, we have in the final resort only left us the *personal taste*, which is fixed by no rule, and admits of no discussion. And, in truth, if we start, in the selection of objects for representation, from that which mankind *generally* discover as beautiful and ugly, and accept accordingly for artistic imitation, in other words, form their particular taste, there is no province in the domain of the objective world which is not open to us, and which is hardly likely to fail to secure its admirer. At any rate, among men we may assume, that, though the case of every husband and his wife may be disputed, yet at least every bridegroom regards his bride as beautiful, very possibly being the only person who does so; and that an individual taste for a beauty of this kind admits of no fixed rules at all may be regarded as a bit of luck for both parties. If, moreover, we cast a glance wholly beyond mere individuals and their accidental taste

to that of nations, this again is full of diversity and opposition. How often we hear it repeated that a European beauty would not please a Chinaman, or even a Hottentot — a Chinaman having a totally distinct notion of beauty from that of a black man, and the black man in his turn from that of a European. Indeed, if we consider the works of art of those extra-European peoples, their images of gods, for instance, which have been imaginatively conceived as worthy of veneration and sublime, they can only appear to us as frightful idols; their music will merely ring in our ears as an abominable noise, while, from the opposite point of view, such aliens will regard our sculptures, paintings, and musical compositions as having no meaning or actually ugly.

(*γ*) But even assuming that we abstract from an objective principle of art, and retain the beautiful as established on the subjective and individual taste, we shall soon discover, from the point of view of art itself, that the imitation of natural objects, which appeared to be a universal principle, and indeed one secured by important authorities, is not to be relied upon, at least under this general and wholly abstract conception of it. If we look at the particular arts we cannot fail to observe that, albeit painting and sculpture portray objects which resemble those of Nature, or the type of which is essentially borrowed from Nature, the works of architecture on the contrary — and this, too, is one of the *fine* arts — quite as little as the compositions of poetry, to the extent at least that these latter are not restricted to mere description, cannot justly be described as imitations of Nature. At any rate, if we are desirous of maintaining such a thesis with respect to the arts thus excluded, we should find ourselves forced to make important deviations from the track, in order to condition our proposition in various ways, and level down our so-called truth at least to the plane of probability. But once accept probability, and we should again be confronted with a great difficulty in determining precisely what is and what is not probable; and in the end no

one could really think of or succeed, even if he did so, in excluding from poetry all compositions of an entirely capricious and completely imaginative[81] character.

The end or object of art must therefore consist in something other than the purely formal[82] imitation of what is given to objective sense, which invariably can merely call into being technical *legerdemain* and not *works* of art[83]. It is no doubt an essential constituent of a work of art that it should have natural forms as a foundation, because the mode of its representation is in external form, and thereby along with it in that of natural phenomena. In painting it is obviously an important study to learn to copy with accuracy colours in their mutual relations, such as light effects and reflections, and so forth, and, with no less accuracy, the forms and shapes of objects carried into their most subtle gradations of line. It is in this respect that in modern times more particularly the principle of the imitation of Nature and naturalism generally has come into vogue. The object has been to recall an art, which has deteriorated into weakness and nebulosity, to the strength and determinate outlines of Nature, or, in yet another direction, as against the purely arbitrary caprice and convention of a studio, which is in truth as remote from Nature as it is from art, and merely indicates the path of art's declension, to assert the claim of the legitimate, direct, and independent, no less than coherent stability of natural fact. But while admitting that from a certain point of view such an effort is reasonable enough, yet for all that the naturalism which it demands, taken by itself, is neither the substantive thing, not yet of primary importance, in the true basis of art; and although the external fact in its natural appearance constitutes an element of essential value, yet the objective fact alone does not supply the *standard* of rightness, nor is the mere imitation of external phenomena, in their external shape that is, the *end* of art.

(*b*) And as a consequence of this we have the further question— "What is the true *content* of art, and with what aim is that content brought before us?" On this head we are confronted by the common opinion that it is the task and object of art to bring before our sense, feeling, and power of emulation[84] *every thing* that the spirit of man can perceive or conceive. Art has in short to realize for us the well-known saying, "*Nihil humani a me alienum puto.*" Its object is therefore declared to be that of arousing and giving life to slumbering emotions, inclinations, passions of *every* description, of filling the heart up to the brim; of compelling mankind, whether cultured or the reverse, to pass through all that the human soul carries in its most intimate and mysterious chambers, all that it is able to experience and reproduce, all that the heart is able to stir and evoke in its depths and its countlessly manifold possibilities; and yet further to deliver to the domain of feeling and the delight of our vision all that the mind may possess of essential and exalted being in its thought and the Idea — that majestic hierarchy of the noble, eternal, and true; and no less to interpret for us misfortune and misery, wickedness and crime; to make the hearts of men realize through and through[85] all that is atrocious and dreadful, no less than every kind of pleasure and blessedness; and last of all to start the imagination like a rover among the day-dream playing-fields of the fancy, there to revel in the seductive mirage of visions and emotions which captivate the senses. All this infinitely manifold content — so it is held — it is the function of art to explore, in order that by this means the experience of our external life may be repaired of its deficiencies, and yet from a further point of view that the passions we share with all men[86] may be excited, not merely that the experiences of life may not have us unmoved, but that we ourselves may thereafter long to make ourselves open channels of a universal experience. Such a stimulus is not presented on the plane of actual experience itself[87], but can only come through the semblance of it,

that is to say through the illusions which art, in its creations, substitutes for the actual world. And the possibility of such a deception, by means of the semblances of art, depends on the fact that all reality must for man pass through the medium of the vision and imaginative idea; and it is only after such a passage that it penetrates the emotional life and the will. In such a process it is of no consequence whether it is immediate external reality which claims his attention, or whether the result is effected by some other way, in other words by means of images, symbols, and ideas, which contain and display the content of such actuality. Men are able to imagine things, which do not actually exist, as if they did exist. Consequently it is precisely the same thing for our emotional life, whether it is the objective world or merely the show of the same, in virtue of which a situation, a relation, or any content of life, in short, is brought home to us. Either mode is equally able to stir in us an echo to the essential secret which it carries, whether it be in grief or joy, in agitation or convulsion, and can cause to flow through us the feelings and passions of anger, hate, pity, anxiety, fear, love, reverence and admiration, honour and fame.

The awakening of every kind of emotion in us, the drawing our soul through every content of life, the realization of all these movements of soul-life by means of a presence which is only external as an illusion — this it is which, in the opinion described, is pre-eminently regarded as the peculiar and transcendent power of artistic creation.

We must not, however, overlook the fact that in this view of art as a means to imprint on the soul and the mind what is good and evil alike, to make man more strong in the pursuit of what is noblest, no less than enervate his definite course[88], by transporting his emotional life through the most sensuous and selfish desires, the task as yet proposed to art remains throughout of an entirely formal character; without possessing

independently an assured aim all that art can offer is the empty form for every possible kind of ideal and formative content.

(*c*) As a matter of fact art does not possess this formal side, namely, that it is able to bring before our senses and feeling and artistically adorn every possible kind of material, precisely as the thoughts of ordinary reflection[89] elaborate every possible subject-matter and modes of action, supplying the same with its equipment of reasons and vindications. In the presence, however, of such a variety of content we cannot fail to observe that these diversified emotions and ideas, which it is assumed art has to stimulate or enforce, intersect each other, contradict and mutually cancel each other. Indeed, under this aspect, the more art inspires men to emotions thus opposed, to that extent precisely it merely enlarges the cleavage in their feelings and passions, and sets them staggering about in Bacchantic riot, or passes over into sophistry and scepticism precisely as your ordinary free thinkers do. This variety of the material of art itself compels us, therefore, not to remain satisfied with so formal a determination. Our rational nature forces its way into this motley array of discord, and demands to see the resurrection of a higher and more universal purpose from these elements despite their opposition, and to be conscious of its attainment. Just in a similar manner the social life of mankind and the State are no doubt credited with the aim that in them *all* human capacities and *all* individual potencies should meet with expansion and expression in *all* their features and tendencies. But in opposition to so formal a view there very quickly crops up the question in what *unity* these manifold manifestations are to be concentrated, and what *single end* they must have for their fundamental concept and ultimate end. Just as in the case of the notional concept of the human State so too there arises in that of human art the need, as to a part thereof, for an end *common* to the particular aspects, no less than in part for one which is more exalted and *substantive* in its character[90].

As such a substantive end the conclusion of reflection is readily brought home to us that art possesses at once the power and function to mitigate the savagery of mere desires.

(α) With regard to this first conception we have merely to ascertain what characteristic peculiar to art implies this possibility of eliminating this rawness of desire, and of fettering and instructing the impulses and passions. Coarseness in general has its ground-root in an unmitigated self-seeking of sensuous impulses, which take their plunge off and are exclusively intent on the satisfaction of their concupiscence. Sensual desire is, however, all the more brutal and domineering, in proportion as, in its isolation and confinement, it appropriates the *entire man*, so that he does not retain the power to separate himself in his universal capacity from this determinacy and to maintain the conscious presence of such universality[91]. Even if the man in such a case exclaims, “the passion is mightier than myself,” though it is true no doubt that for that man’s mind the abstract ego is separate from the particular passion, yet it is purely so in a formal way. All that such a separation amounts to is that as against the force of the passion the ego, in its universal form or competency, is of no account at all. The savageness of passion consists therefore in the fusion[92] of the ego as such a universal with the confined content of its desire, so that a man no longer possesses volitional power outside this single passion. Such savageness and untamed force of the possibilities of passion art mitigates in the first instance to the extent that it brings home to the mind and imagination of man what he does actually feel and carry into effect in such a condition. And even if art restricts itself to this that it places before the vision of the mind pictures of passion, nay, even assuming such to be flattering pictures, yet for all that a power of amelioration is contained therein. At least we may say, that by this means is brought before a man’s intelligence what apart from such presentment he merely *is*. The man in this

way contemplates his impulses and inclinations; and whereas apart from this they whirl him away without giving him time to reflect, he now sees them outside himself and already, for the reason that they come before him rather as objects than a part of himself, he begins to be free from them as aliens. For this reason it may often happen that an artist, under the weight of grief, mitigates and weakens the intensity of his own emotions in their effect upon him by the artistic representation of them. Comfort, too, is to be found even in tears. The man who to start with is wholly given up to and concentrated in sorrow, is able thus, at any rate, to express that which is merely felt within in a direct way. Yet more alleviating is the utterance of such inner life in words, images, musical sound, and shapes.

It was therefore a good old custom in the case of funerals and layings-out to appoint wailing women, in order to give audible expression to grief, or generally to create an external sympathy. For manifestations of sympathy bring the content of human sorrow to the sufferer in an objective form; he is by their repetition driven to reflect upon it, and the burden is thereby made lighter. And so it has from of old been considered that to weep or to speak oneself out are equally means whereby freedom is secured from the oppressing burden, or at least the heart is appreciably lifted. Consequently the mitigation of the violence of passions admits of this general explanation that man is released from his unmediated confinement[93] in an emotion, becomes aware of it as a thing external to himself, to which he is consequently obliged to place himself in an ideal relation. Art, while still remaining within the sphere of the senses, faces man from the might of his sensitive experience by means of its representations. No doubt we frequently hear that pet phrase of many that it is man's duty to remain in immediate union with Nature. Such union is in its unmediated purity nothing more or less than savagery and wildness; and art, precisely in the way that it dissolves this unity for human beings, lifts them with gentle

hands over this inclosure in Nature. The way men are occupied with the objects of art's creation remains throughout of a contemplative[94] character; and albeit in the first instance it educates merely an attention to the actual facts portrayed, yet over and beyond this, and with a power no less decisive, it draws man's attention to their significance, it forces him to compare their content with that of others, and to receive without reserve the general conclusions of such a survey and all the ramifications[95] such imply.

(*β*) To the characteristic above discussed adheres in natural sequence the second which has been predicated of art as its essential aim, namely, the *purification* of the passions, an instruction, that is, and a building to *moral* completeness. For the defining role that art has to bridle savage nature and educate the passions remained one wholly formal and general, so that the further question must arise as to a *specific* kind and an essential and *culminating* point of such an educative process.

(*αα*) The doctrine of the purification of the passions shares in the defect previously noted as adhering to the mitigation of desires. It does, however, emphasize more closely the fact that the representations of art needed a standard, by means of which it would be possible to estimate their comparative worth and unworth. This standard is just their effectiveness to separate what is pure from that which is the reverse in the passions. Art, therefore, requires a content which is capable of expressing this purifying power, and in so far as the power to assert such effectiveness is assumed to constitute the substantive end of art, the purifying content will consist in asserting that effective power before consciousness in its *universality* and *essentiality.*[96]

(*ββ*) It is a deduction from the point of view just described that it is the end of art to *instruct.* Thus, on the one hand, the peculiar character of art consists in the movement of the emotions and in the satisfaction which is found in this movement, even in fear, compassion, in painful agitation and

shock — that is to say, in the satisfying concern of the feelings and passions, and to that extent in a complacent, delighted, or enthusiastic attitude to the objects of art and their presentation and effect: while, on the other hand, this artistic object is held to discover its higher standard exclusively in its power to instruct, in the *fabula docet*, and thereby in the usefulness, which the work of art is able to exercise on the recipient. In this respect the Horatian adage

Et prodesse volunt et delectare poetae[97]

contains, concentrated into a few words, all that in after times has been drawn out as a doctrine of art through every conceivable grade of dilution to the last extreme of insipidity.

In respect, then, to such instruction we have to ask whether the idea is that the same ought to be direct or indirect in the work of art, explicit or implicit.

Now if the question at issue is one of general importance to art about a universal rather than contingent purpose, such an ultimate end, on account of the essential spirituality of art, can only be itself of spiritual import; in other words, so far from being of accidental importance it must be true in virtue of its own nature and on its own account. An end of this kind can only apply to instruction in so far as a genuine and essentially explicit content is brought before the mind by means of the work of art. From such a point of view we are entitled to affirm that it is the function of art to accept so much the more of a content of this nature within its compass in proportion to the nobility of its rank, and that only in the verity of such a content will it discover the standard according to which the pertinency of or the reverse of what is expressed is adjudged. Art is in truth the primary[98] *instructress* of peoples.

But, on the other hand, if the object of instruction is so entirely treated as an *end* that the universal nature of the content presented cannot fail to be

asserted and rendered-bluntly and on its own account explicit as abstract thesis, prosaic reflection or general maxim, rather than merely in an indirect way contained by implication in the concrete embodiment of art, then and in that case, by means of such a separation, the sensuous, plastic configuration, which is precisely that which makes the artistic product a *work of art*, is merely an otiose accessory, a husk, a semblance, which are expressly posited as nothing more than *shell* and semblance. Thereby the very nature of a work of art is abused. For the work of art ought not to bring before the imaginative vision a content in its universality as such, but rather this universality under the mode of individual concreteness and distinctive sensuous particularity. If the work in question does not conform to such a principle, but rather sets before us the generalization of its content with the express object of instruction pure and simple, then the imaginative no less than the material aspect of it are merely an external and superfluous ornament, and the work of art is itself a shattered thing within that ornament[99], a ruin wherein form and content no longer appear as a mutually adherent growth. For, in the case supposed, the particular object of the senses and the ideal content apprehended by the mind[100] have become external to one another.

Furthermore, if the object of art is assumed to consist in utilitarian *instruction* of this kind, that other aspect of delight, entertainment, and diversion is simply abandoned on its own account as *unessential*; it has now to look for its substance to the utility of the matter of instruction, to which it is simply an accompaniment. But this amounts to saying, that art does not carry its vocation and purpose in itself, but that its fundamental conception is in something else, to which it subserves as a *means.* Art becomes, in short, merely one of the many means, which are either of use, or may be employed to secure, the aim of instruction. This brings us to the boundary line where art can only cease to be an end on its own independent account;

it is deliberately deposed either to the mere plaything of entertainment, or a mere means of instruction.

(*γγ*) The line of this limit is most emphasized when the question is raised as to the end or object of highest rank for the sake of which the passions have to be purified or men have to be instructed. This goal has frequently in modern times been identified with *moral improvement*, and the end of art is assumed to consist in this that its function is to prepare our inclinations and impulses, and generally to conduct us to the supreme goal of moral perfection. In this view we find instruction and purification combined. The notion is that art by the insight it gives us of genuine moral goodness, in other words, through its instruction, at the same time summons us to the process of purification, and in this way alone can and ought to bring about the improvement of mankind as the right use they can make of it and its supreme object.

With reference to the relation in which art stands to the end of improvement, we may practically say the same thing as we did about the didactic end. It may readily be admitted that art as its principle ought not to make the immoral and its advance its end. But it is one thing deliberately to make immorality the aim of its presentation and another not expressly to do so in the case of morality. It is possible to deduce an excellent moral from any work of art whatever; but such depends, of course, on a particular interpretation and consequently on the individual who draws the moral. The defence is made of the most immoral representations on the ground that people ought to become acquainted with evil and sin in order to act morally. Conversely, it has been maintained that the portrayal of Mary Magdalene, the fair sinner, who afterwards repented, has seduced many into sin, because art makes repentance look so beautiful, and you must first sin before you can repent. The doctrine of moral improvement, however

logically carried out, is not merely satisfied that a moral should be conceivably deducible from a work of art through interpretation; on the contrary, it would have the moral instruction clearly made to emerge as the substantive aim of the work[101]; nay, further, it would deliberately exclude from art's products all subjects, characters, actions, and events which fail to be moral in its own sense. For art, in distinction from history and the sciences, which have their subject-matter determined for them, has a choice in the selection of its subjects.

In order that we may be in a position to estimate this view of the moral end of art on the basis of principle, we ought above all to raise the question as to the precise standpoint of the morality which is recommended for our reception by this view. If we examine more closely the standpoint of morality such, as is submitted us to-day under an enlightened interpretation[102], we soon discover that its conception does not immediately coincide with that which we describe in a general way as virtue, respectability[103], uprightness, and so forth. To be a respectable honest man is not sufficient to make a man moral in the sense under discussion, for morality in this sense implies *reflection* and the definite consciousness of what is consonant with duty, and the acts which issue from such a consciousness. Now duty is itself the law of the will, which man, however, freely establishes out of himself, and thereon is taken to determine himself to this duty for duty's sake and its fulfilment's sake; in other words he only does good as acting under the conviction already secured that it is the good. This law — the duty which is selected and carried into effect for duty's sake to be the rule of conduct out of free conviction and the inner conscience — is, on its own account, the abstract universal of the will, which is the absolute antithesis to Nature, the impulses of sense, selfish interests, the passions and all that is commonly described collectively as emotional life and heart. In this opposition the one side is regarded as *negating* the other;

and for the reason that both are present in the individual in their opposition, he is compelled, as determining himself from his own identity, to adopt the choice of one to the rejection of the other. Such a decision and the act carried out in accordance with it merely become moral from the standpoint now considered on the one hand in virtue of the free conviction of duty, and on the other by reason of the victory secured not only over the particular will, the natural motives, inclinations, passions and so on, but also in virtue of the noble feelings and higher impulses. For the modern ethic starts from the fixed opposition between the will in its spiritual universality and its sensuous natural particularity; it does not consist in the perfected mediation of these opposed aspects, but in their mutual conflict as opposed to one another, which carries with it the demand, that the impulses in their antagonism to duty ought to yield to it.

An opposition of this nature is not merely present to mind in the restricted confines of moral action; it asserts itself as a fundamental severation and antithesis between that which is actual essentially, and on its own account, and that which is external reality and existence[104]. Apprehended in entirely formal terms it is the contrast exposed by the universal, in so far as it is fixed in its substantive independence over against the particular, as the latter is also on its part rigidly exterior to it. In more concrete form it appears in Nature as the opposition of the abstract law to the wealth of particular phenomena, each of which possesses its specific characteristics. It appears in mind as that between the sensuous and spiritual in man, as the conflict of spirit with the flesh; it is that of duty for duty's sake; of the cold imperative with particular impulses, the warm heart, the sensuous inclinations and impulses, in a word with man simply as individual. Or it appears as the harsh antagonism between the inward freedom and the external necessity of natural condition, and, lastly, as the contradiction of the dead, essentially emptied, concept, when confronted

with the fulness of concrete life, in other words, of theory and subjective thought as contrasted with objective existence and experience.

Such are antithetical points of view, the discovery of which is not to be ascribed either to the ingenuity of reflective minds, or the pedantry of a philosophical cult. They have in all ages, if in manifold guise, occupied and disquieted the human consciousness, although it is our more modern culture which has emphasized their opposition most deliberately, and forced it in each case to the keenest edge of contradiction. Intellectual culture, or rather the rapier edge of the modern understanding, creates in man this contrast, which converts him into some amphibious animal. He is compelled to live in two worlds mutually contradictory; and in this divided house consciousness, too, wanders aimlessly; tossed over from one side to the other it is unable to discover permanent satisfaction[105] for itself in either one side or the other. For, on the one hand, we see mankind confined within common reality and earthly temporal condition, oppressed by necessity and want, in Nature's toils, entangled in matter, in sensuous aims and their enjoyment, dominated and whirled away by impulse and passion. On the other hand he lifts himself up to eternal idea's, to a realm of thought and freedom. As Will he legislates for himself universal laws and destinations[106], he disrobes the world of the life and blossom of its reality; he dissolves it in abstractions, that the mind may vindicate its right and intrinsic worth by this very dissolution of Nature's rights and such maltreatment, a process in which he brings home to her again the necessity and violence he has experienced at her hands. Such a cleavage of life and mind is, however, accompanied for modern culture with the demand that a contradiction so deep-seated should be dissolved. The mere understanding of abstract reflection is unable to disengage itself from the obstinacy of such contradictions. The solution consequently remains here for consciousness a mere *ought*, and the present and reality is merely moved within the

continuous unrest of a to and fro, which seeks for that reconciliation it is unable to find. The problem therefore arises whether such a many-sided and fundamental antagonism, which is unable to pass beyond the mere ought and postulate of its solution, can be the essential and wholly expressed truth, and[107], indeed, the final and supreme consummation. If the culture of the civilized world has fallen into such a contradiction it becomes the task of philosophy to dissolve the same, in other words to demonstrate that neither the one side or the other, in its one sided abstractness, should be held to possess truth, but that they contain within themselves the principle of their dissolution. The truth only *then* comes before us in the reconciliation and mediation of both; and this mediation is no mere postulate, but is, in its essential nature, and in its actual presence the at the same time accomplished and self-accomplishing. And, in fact, this view agrees directly with unwitting[108] faith and will, which always has before its conscious life this contradiction in its resolution, and in action accepts it as its aim and carries it into effect. All that philosophy achieves is to contribute the insight of thought into the essence of such cleavage. It demonstrates, or seeks to demonstrate, how that which truth really is is simply the resolution of the fracture, and, be it added, not in the sense that this antagonism and its alternative aspects in any way *are not*, but in the sense that they are *there*[109] in reconciliation.

(*d*) When discussing moral improvement as the ultimate end accepted for art it was found that its principle pointed to a higher standpoint. It will be necessary also to vindicate this standpoint for art.

Thereby the false position to which we have already directed attention vanishes, namely, that art has to serve as a means for moral ends and the moral end of the world generally by means of its didactive and ameliorating influence, and by doing so has its essential aim not in itself, but in something else. If we therefore continue still to speak of an end or goal of

art, we must at once remove the perverse idea, which in the question, "What is the end?" will still make it include the supplemental query, "What is the use?" The perverseness consists in this that the work of art would then have to be regarded as related to something else, which is presented us as what is essential and ought to be. A work of art would in that case be merely a useful instrument in the realization of an end which possessed real and independent importance outside the realm of art. As opposed to this we must maintain that it is art's function to reveal *truth* under the mode of art's sensuous or material configuration, to display the reconciled antithesis previously described, and by this means to prove that it possesses its final aim in itself, in this representation in short and self-revelation. For other ends such as instruction, purification, improvement, procuring of wealth, struggle after fame and honour have nothing whatever to do with this work of art as such, still less do they determine the fundamental idea[110] of it.

It is then from this point of view, into which the reflective consideration of our subject-matter finally issues, that we have to grasp the fundamental idea of art in terms of its ideal or inward necessity, as it is also from this point of view that historically regarded the true appreciation and acquaintance with art took its origin. For that antithesis, to which we have drawn attention, did not merely assert its presence within the general thought of educated men, but equally in philosophy as such. It was only after philosophy was in a position to overcome this opposition absolutely that it grasped the fundamental notion of its own content, and, to the extent it did so, the idea of Nature and of art.

For this reason, as this point of view implies the reawakening of philosophy in the widest connotation of the term, so also it is the re-awakening of the science of art. We may go further and affirm that aesthetic as a science is in a real sense primarily indebted to this re-awakening for its true origination, and art for its higher estimation.

IV

From this point of transition, I will briefly summarize the historical subject-matter that I have in my mind's eye, partly on account of the historical importance itself, and in part because thereby the points of view are more clearly indicated to which importance is attached, and upon the basis of which we propose to continue the superstructure. In its most general definition that basis consists in this, that the beauty of art has become recognized as one of the means which resolve and bring back to unity that antithesis and contradiction between the mind and Nature as they repose in abstract alienation from each other in themselves, whether this latter is regarded as external phenomena or the inward world of individual feeling and emotion[111].

1. It was the philosophy of Kant which, in the first instance, not merely experienced the want of such a point of union, but secured definite knowledge of it and brought it clearly before the mind. Speaking generally, Kant accepted as his basis for intelligence no less than for the will the rationality which relates itself to itself or freedom, the self-consciousness that discovers and knows itself essentially as infinite. This knowledge of the absoluteness of reason in its essential substance, which has proved in more modern times the turning-point of philosophy, this absolute point of departure deserves recognition, and does not admit of refutation, even though in other respects the Kantian philosophy is inadequate. But at the same time it was Kant who through falling back upon the fixed opposition between subjective thought and objective things, between abstract universality and the sensuous individuality of the will, in a pre-eminent degree strained to the extremest limit the very antithesis of morality we have previously adverted to, inasmuch as over and above this he emphasized the practical operation of mind to the disadvantage of the contemplative. In virtue of this fixity of the antithesis as cognized by the

faculty of the understanding he had no other alternative than to express the unity exclusively in the form of subjective ideas for which no adequate reality could be demonstrated as correspondent; or, on its practical side, as postulates, which it was no doubt possible to deduce from the practical reason, but whose essential being was not within the cognition of thought, and the practical fulfilment of which remained throughout a mere "ought" deferred to infinity. And for this reason, though Kant did actually bring the reconciled opposition within the compass of intelligible ideas, he was neither able to develop its essential truth scientifically, nor to assert the same as actual and exclusive reality. Unquestionably Kant did press beyond this point, in the sense, that is to say, that he discovered the unity demanded in what he called the *intuitive* understanding; but in this respect too he is held up by the opposition of subjectivity and objectivity, so that, while he no doubt offers us a resolution in an abstract sense of the antithesis between conception and reality, universality and particularity, understanding and sense-perception, and suggests the Idea, yet he once more conceives this resolution and reconciliation itself in a wholly *subjective* sense, not as being true and real both essentially and on its own independent account. In this respect the Critique of the power of the judgment, in which he investigates the aesthetic and teleological power of the judgment is both instructive and remarkable. The beautiful objects of Nature and art, the products of Nature with their adaptations to ends, by means of which he approaches more closely the notion of the organic and the living, he considers wholly from the point of view of the reflection which judges them subjectively. And indeed Kant himself generally defines the power of judgment as "the capacity to think the particular as comprised under the universal," and calls the power of judgment *reflective* "when it has only the particular submitted to it, and has to discover the universal under which it is subsumed." To this end it requires a law, a principle, which it has to contribute to itself; and

Kant affirms *teleology* to be this law. With regard to the conception of freedom which belongs to the practical reason the achievement of end or purpose gets no further than a mere “ought”; and in the teleological judgment, however, relatively to the living thing, Kant does manage to regard the living organism in such a way that the notional concept, the universal, succeeds in also including the particular, and as end does not determine the particular and external, the structure of the members from outside, but as an inward principle, and under the mode, that the particular conforms to the end spontaneously. Yet with such a judgment once more it is assumed that the objective nature of the thing is not known, but that it is only a mode of subjective reflection which is thereby expressed. In a similar way Kant so conceives the *aesthetic* judgment that it neither proceeds from the understanding, as such, in other words as the faculty of ideas, nor yet from the sensuous perception as such, and its varied manifold, but from the free play of the understanding and the imagination. In this common agreement of the faculties of knowledge the object finds its relation to the individual consciousness, and its feeling of pleasure and contentment.

(*a*) Now this general feeling of contentment is, in the first place, without any interest, that is to say, it is *devoid of relation* to our *appetitive faculty.* If we have an interest of curiosity, shall we say, or a sensuous interest excited for a physical want, a desire for possession and use, then the objects are not important for their own sake, but in virtue of our need of them. In a case such as this what exists merely possesses a value in relation to such a need, and the relation is of the kind, that the object is on the one side and on the other is an attribute distinct from the object to which we relate it none the less. As an illustration if I consume the object in order to nourish myself therewith, this interest rests exclusively in me, and remains alien to the object. Now, in Kant’s view, our position relatively to the beautiful is not of this description. The aesthetic judgment suffers that which is externally

presented to subsist in free independence, proceeding as it does from the desire to permit the object to persist on its own account and to retain its end unimpaired within itself. This is, as we have already observed, an important observation.

(*b*) In the second place, Kant maintains that the beautiful is definable as that which without a conception, *i.e.*, without a category of the understanding, is placed before us as the object of a *universal* satisfaction. To estimate the beautiful an educated mind is indispensable. The man in the street[112] has no judgment about the beautiful; this judgment, in fact, claims universal validity. The universal is no doubt in the first instance simply, *as such*, an abstraction, one which, however, is in its essential and on its independent account, true; and consequently carries essentially the property and demand to pass also as universally valid. In this sense, too, the beautiful ought to be universally recognized, although the mere concepts of the understanding are compatible with no judgment thereupon. The good — the right which enters into particular actions, for example — is subsumed under universal concepts, and the action is accepted as good, if it is conformable to such concepts. The beautiful, on the contrary, ought, according to this view, to arouse a universal satisfaction without any such mediation of concept. This simply means that in the contemplation of the beautiful we are not conscious of the notional concept or any subsumption under it, and do not permit the independent passage of the separation between the particular object and the universal concept, which is present in all other cases of the judgment.

(*c*) Thirdly, in this view of Kant, the beautiful ought to have the *teleological* form to the extent that the teleological relation is apprehended in the object without the idea of an end. This is substantially a mere repetition of the view just discussed. Any natural product — take, for instance, a plant or an animal — is organized as adapted to an end, and is so

immediately to us in this its teleological purpose, that we have no conception of the end on its own account as separate and distinct from the actual presence of the object. It is in this way that the beautiful also is presented us teleologically. In finite teleology end and means remain external to each other; the end stands in no essential inner relation to the material means of its execution[113]. In this case the idea of the end as recognized in apartness[114] is distinguishable from the object in which the end appears as realized. The beautiful, on the contrary, exists as teleological in the essential sense, without means and end appearing as disparate in aspects distinct from each other. For example, the purpose of the members of the organism is the principle of life which exists in the members as actual therein. In their separation[115] the parts cease to be members of a whole. For in the living thing the end and material medium of the end are so immediately united, that the existing being only exists in so far as the end remains indwelling. The beautiful, as thus regarded and in Kant's view, does not carry its teleological purpose as an external form attached to it: but the teleological correspondence of the inner and outer is to be regarded as the immanent nature of the beautiful object.

(*d*) Fourthly and finally the view of Kant posits the beautiful under the mode that it is recognized without a universal concept as object of a *necessary* feeling of satisfaction. Necessity is an abstract category, and indicates an ideal and essential relation between two aspects or sides: if the one is, and because the one is, then, and for that reason, the other is also. The one likewise includes the other within its determinate nature. Cause is meaningless without effect. The pleasure which we obtain from beauty is necessary in this sense, and it is so wholly without a relation to conceptions, that is to say the categories of the understanding. Thus, no doubt, we derive pleasure from what is symmetrical, for this is constructed in accord with an

idea of the understanding. Kant, however, demands more as a definition of delight in art than the unity and uniformity of such an idea as this.

Now what we find in all these theses of Kant is the non-severation of that which otherwise is assumed to be distinct in consciousness. In the beautiful this separation is found to be abolished. The universal and particular, purpose and means, idea and object completely interpenetrate each other. Thus, too, Kant sees the beauty of *art* as a concurrence, in which the particular itself is conformable to the conception. Particulars, taken alone, are primarily, both as against each other and the universal, of a contingent nature; and this very contingent element, whether we find it in sense, feeling, susceptibility, or impulse, is now in the beauty of art not merely *subsumed* under the categories of the understanding, and *dominated* by the notion of freedom in its abstract universality, but united to the universal in such a way that it appears inwardly and on its own merits as realized fact adequate thereto. By this means thought is incorporated in fine art, and the material is not externally defined by such thought, but continues to exist in its own freedom. In other words, what is natural — the senses, emotional temperament, and so forth — possess in themselves measure, end, and agreement. Perception and feeling, too, in the same way are raised to a power of spiritual universality; and thought no less not merely renounces its hostility to Nature, but is made blithe therein. Feeling, pleasure, and enjoyment are thereby justified and sanctified, and thus it is that Nature and freedom, sense and idea in *one* presence discover their just place and their satisfaction. Yet even this apparently complete reconciliation is ultimately still assumed to be[116] merely subjective in respect to our judgment no less than our productive activity, and not to be essentially and on its own account either the true or real.

These may, I think, be taken to be the main results of the Critique of Kant so far as they affect our present inquiry. It constitutes the starting-point

for the true conception of the beauty of art. Such a conception could, however, only make itself effective as the higher comprehension of the true union of necessity and freedom, particular and universal, sensuous and rational, by its overcoming the defects still latent in the previous standpoint.

It must in fact be admitted that the artistic sense of a profound and, at the same time, philosophical spirit anticipated philosophy in the stricter sense by its demand for and expression of the principle of totality and reconciliation in its opposition to that abstract finiteness of thought, that duty for duty's sake, that understanding faculty devoid of any substantive content, which one and all apprehend nature and reality, sense and feeling, merely as a *limits* something downright alien or hostile. It is Schiller who must be credited with the important service of having broken through the Kantian subjectivity and abstractness of thought, and of having ventured the attempt to pass beyond the same by comprehending in thought the principles of unity and reconciliation as the truth, and giving artistic realization to that truth. For Schiller, in his aesthetic investigations, did not merely adhere to art and its interest unaffected by their relation to philosophy proper, but he compared his own interest in the beauty of art in their due relation to philosophical principles; and it is only from the starting-point of these latter and by their aid that he penetrated the profounder nature and notional concept of Beauty. Thus we are conscious that it was a feature of a certain period of his productive activity that he was actively engaged with reflective thought, more perhaps than was wholly favourable to the simple and direct beauty of his work as an art product. The deliberate character of abstract reflections, and even the interest of the philosophical notion, arrest the attention in several of his poems. He has, in fact, been made the subject of stricture on this account; and especially his work has been blamed and depreciated in its contrast with the equable serenity and straightforward simplicity of Goethe's ideas and more

objective naturalism. But in this respect Schiller as poet did but pay the debt of his century. A real ideal evolution[117] was responsible, the recognition of which only redounds to the honour of this sublime soul and profound genius, as it has been no less of signal profit to science and knowledge. This stimulating movement of science during the same epoch also diverted Goethe from the sphere, most distinctively his own, as poet. But just as Schiller was absorbed in the study of the ideal depths of the *mind*, so the characteristic predilection of Goethe inclined to the *physical* aspect of art, to external nature, such as animal and vegetable organization, crystals, cloud-formation and colours. To such scientific inquiry Goethe applied his extraordinary powers of intuition, which in these provinces have driven off the field the theories of the mere understanding and their errors, just as Schiller, on the other side, succeeded in demonstrating the Idea of the free totality of Beauty as against the theory of the analytical understanding relative to volition and thinking. An entire series of Schiller's productions is devoted to this insight into the nature of art. Above all in importance come the "Letters upon aesthetic education." In these letters the main point of departure is that every individual man contains within himself the natural capacity of an ideal humanity. This genuine human being is represented by the State, which, in his view, is the objective, universal, and, in short, normal form, in which the separate individuals or subjects of such human consciousness aim at making all coalesce and concentrate in unity. There were then, in his view, two imaginable ways in which man in the temporal process could thus coalesce with the human being in the notional Idea[118]. On the one hand this could be effected in the suppression of individuality by the State under its generic idea of morality, law, and intelligence[119]: while, on the other, a similar result could be effected by the individual himself raising himself to the level of such a generic conception, in other words, by the man of the particular temporal condition ennobling himself to the level of

the essential man of the Idea. Now, in this view, reason demands unity as such, the generic attribution; Nature, however, asks for variety and individuality, and both these legislatures make a simultaneous claim upon man. Confronted with the conflict of these antagonistic rivals, aesthetic education simply consists in giving actual effect to the demand for their mediation and reconcilement. The aim of such an education is, according to Schiller, to give vital form to inclination, the senses, impulse and emotional life in such a way that they become essentially permeated with mind; and, from the reverse point of view, that reason, freedom, and spirituality come forth from the grave-clothes of their abstractedness, are mated in union with the natural element thus essentially rationalized, and thus receive the substance of flesh and blood. Beauty is therefore affirmed to be the conformative unification[120] of the rational and the sensuous, and this union is pronounced the truly real.

This view of Schiller will in its general terms be all the more readily recognized in "Anmuth und Würde[121]," as also in his poems for the reason that the praise of women is in such works more particularly the theme. It was pre-eminently in *their* character that he recognized and emphasized the spontaneously present conjunction of the spiritual and natural.

This unity of the universal and particular, of freedom and necessity, of spirituality and the natural element, which Schiller conceived with scientific thoroughness as the principle and essence of art, and endeavoured indefatigably to call into actual life by means of art and aesthetic education, has received yet further recognition in *the Idea itself*, cognized as the supreme principle of knowledge and of existence, the Idea in this sense being apprehended as sole truth and reality. By means of this acknowledgment science, in the philosophy of Schelling, attained its absolute standpoint; and although art had already begun to assert its peculiar rights and dignity in their relation to the highest interests of man, it

was only now that the *notion* itself and the scientific position of art were discovered. It was then that art was — even if, from a certain point of view, with a measure of perversity, which this is not the proper place to discuss — accepted with due reference to its exalted and true vocation. Even before this time and independently Winckelmann had been inspired by his observation of the ideals of the ancients in a way which prompted the creation of a new sense of artistic contemplation, the disengagement of it from the association of vulgar aims and mere imitation of Nature, and exercised a mighty influence in the discovery of the idea of art in works of art and in its history. Winckelmann ought, in fact, to be regarded as belonging to the type of men who have been able in the field of art to supply the mind with a new organ and wholly new methods of observation His views have, however, exercised less influence on the theory and the scientific knowledge of art.

To summarize these historical antecedents further yet more briefly, in association with the renaissance of our modern philosophy, A. W. and Friedrich von Schlegel, impelled by their zest for novelty and all that was either distinctive or arresting, assimilated just so much of the philosophical ideas as was compatible with minds essentially critical, though by no means really philosophical in any strict sense of the term. Neither of these writers in fact can claim the reputation of being speculative thinkers. They did, however, in virtue of their critical sagacity, at least approach the standpoint of the Idea; and with the aid of remarkable boldness of speech and audacity of innovation — to which, however, but very few ingredients of genuine philosophy contributed — directed a brilliant polemic against views hitherto received, and by this means unquestionably introduced a novel standard of criticism and new ways of looking at things which were of superior value to those they attacked. For the reason, however, that their criticism was not accompanied with a knowledge of the nature of such a

standard based on philosophical principles, a lack of definition and continuity was inseparable from this standard; and they at one time attempted too much and again at another too little. Despite, therefore, of the fact that it may be reckoned to their credit that they have once more drawn attention to and emphasized with genuine enthusiasm much hitherto regarded as obsolete and too little appreciated by their times, the works of the older Italian masters, for example, and certain Flemish paintings, as also the "Niebelungen Lied" among other things; despite the fact that they even endeavoured with zeal to acquire knowledge of matter barely known at all, such as the poetry and mythology of India, nevertheless they not only attached too high an importance to the works of such a period, but also themselves committed the mistake of admiring works of very average merit, such as the comedies of Holberg, or of attaching an absolute value to what possessed a purely relative worth, or even of boldly proving themselves the enthusiasts of a perverse tendency and a subordinate standpoint as though one of first-rate importance.

From this tendency, and particularly from the opinions[122] and doctrines of Friedrich von Schlegel, issued in all its manifold forms the so-called *Irony.* The idea had its profounder root, as to one of its aspects, in the philosophy of Fichte, in so far as the principles of that philosophy were applied to art. Friedrich von Schlegel, as also Schelling, made the standpoint of Fichte their point of departure. Schelling passed wholly beyond it; Fried, von Schlegel elaborated it in his own peculiar fashion, and then flung himself free of it. With reference to the more intimate connection of the doctrines of Fichte with one tendency of this irony, it is only necessary to emphasize the following point in our present context, namely this, that Fichte posits the Ego as the absolute principle of all knowledge, reason, and cognition, and in fact posits it as the Ego which persists

throughout in its abstraction of pure form. For this reason this Ego is, in the second place, wholly and essentially simple, and, on the one hand, it is the negation of every particularity, attribute — in short, every content — for every positive subject-matter[123] is overwhelmed in this abstract freedom and unity. On the other hand, every content, which is to pass muster for the Ego, is posited and recognized as exclusively so in virtue of the activity of the Ego. Whatever is, is only in virtue of the Ego; whatever is through me (that is, my Ego) I am in turn able to annihilate.

Now if we abide in these entirely vacant forms, which originate in the absoluteness of the abstract Ego, nothing can then be regarded as of value in itself, that is, essentially and on its own account[124]. It is exclusively produced by the subjectivity of the Ego. But this being so, it follows that the Ego remains lord and master over everything. In no sphere of morals or law, of all that is human or divine, profane or sacred, is there anything at all which would not in the first instance have to be posited by the Ego, and which consequently could not equally be nullified by the same agency. This is nothing less than making all that exists on its own actual and independent warranty a mere semblance, not true and a part of reality on account of itself and by its own instrumentality, but a mere *show* in virtue of the Ego, within whose power and caprice it remains at the free disposition of such. To suffer its presence and to destroy it stands purely in the favour of the Ego, which has attained the absolute standpoint as essentially the Ego, that and nothing more than that.

Thirdly, the Ego is a *living*, active individual, and its life consists in bringing home its individuality to itself no less than to others, in giving expression to itself and revealing itself among phenomena[125]. For every man during his life endeavours to realize himself and does realize himself. In relation to the beautiful and art this means that he lives the life of an artist, and shapes his life *artistically.* But, according to the principle now

discussed, I live as artist when all my action and expression whatever, in so far as it has to do with a content, is for myself on the plane of mere *semblance*, and assumes a formal content which is wholly at my disposal. So I am not truly *serious* either about this content or, speaking generally, about its expression and realization. Genuine seriousness only issues from a substantive interest, a subject-matter which itself possesses a rich content, such as truth, morality, and so on — in other words, from a content which as it stands I regard as essential, so that I only become essential on my own account, in so far as I have absorbed myself in such a content, and have come to conform myself to it in the entire range of my thought and action. At the standpoint at which the artist is the Ego, which both posits and resolves everything through its own essential fiat[126], for which no content of consciousness appears as absolute and essentially independent, but only as itself a semblance created and destroyable, such seriousness can find no place, nothing here receiving a right to be save the formalism of the Ego.

No doubt for others my self-revealment, in which I appear to them, may be taken seriously, inasmuch as they interpret me as though in reality I was in earnest about the business; but therein they are deluded, poor, *borné* creatures, without the faculty or the power to comprehend and attain to the height of my argument. And by this it is brought home to me that *everyone* is not so free (*e.g.,* that is *formally* free) as to see in all which is usually of value, dignity and sanctity to mankind, merely a product of each man's own possibilities of inclination, which is operative in permitting him to determine and make rich the course of his life, or the reverse. It is thus that this virtuosity of your ironical artist's life comes to be credited as some *god-like geniality*, for which every conceivable thing is a purely spectral creature, to which the free creator, knowing himself to be absolutely unattached, does not yoke himself, for he can ever annihilate the same no less than create it. Whoever has reached such a standpoint of god-like

geniality consequently looks down in his superior fashion on all other mortals. They are ruled out as narrow and dull, in so far, that is, as law, morals, and the rest retain for them a validity that is assured, obligatory, and essential. And the individual who thus lives this artist life, which he does no doubt associate with others, whether friends or mistresses or I know not what, yet as man of genius sets no real stock on such relations as they stand to his individual personality and particular actions. All these are as nothing in their contrast to the universal which is his in its own and independent warranty, namely that genius which faces all such with irony. This is the universal import of the genial god-like irony as this concentration of the Ego in itself, for which all bands are broken, and which can only live in the bliss of self-enjoyment. This irony was the discovery of Herr Fried, von Schlegel, and many have chattered about it after him, or it may be are giving us a fresh sample of such chatter.

The proximate form of this negativity which has been called irony is, then, on the one hand, the illusory nature[127] of all that is matter of fact, or moral, or of substantive content, the nothingness of all that is objective and of essential and independent worth. So long as the Ego adheres to such, a standpoint as this, everything appears to be null and void, the personal subjectivity alone excepted, which thereby becomes hollow and empty, and nothing but conceit itself. Conversely, however, from the opposite point of view, the Ego may also fail to find satisfaction in this self-delight; it may prove an insufficient supply to its craving, so that it now feels a thirst for what is secure and substantive, definite and essential interests. From a situation such as this there arises unhappiness and the contradiction, that whereas, on the one hand, the individual seeks to penetrate into truth and longs after objectivity, yet on the other he is unable to divest himself of this isolation and self-seclusion, is unable to overcome this unsatisfied and abstract soul-inwardness, and consequently is seized with a fit of

sentimental yearning, which we have also marked as one of the emanations of the philosophy of Fichte. The discontent of this quiescence and impotence, which is unable either to act or set its hands to anything, lest it have to surrender the harmony within, and which remains unreal and empty, even though it may be essentially unflecked, despite all its craving for reality and the absolute — is the source of morbid saintliness[128] and yearning. A soul that is fair or saintly in a true sense acts and is a reality. But all that yearning and heart burning is merely the feeling of the nothingness of the empty and vain personage, who has it, and yet has not the power to cast himself adrift of this empty void, and fill himself with that which is solid and substantive. In so far, however, as the irony is made an art type it did not restrict itself in giving artistic shape to the life and particular individuality of the man who appropriated the irony. Over and beyond the artistic content of his own actions, etc., the artist had also to produce objective works of art as the creations of his imagination. The principle of such productions, which mainly are confined to the domain of poetry, is once more the display of the god-like as Irony. The ironical here, however, as genial individuality, consists in the self-annihilation of what is noble, great, and excellent. Consequently the independent figures of art will also have to illustrate the principle of absolute subjectivity, and to do so by exhibiting all that is of human worth and dignity as a mere naught in this process of self-annihilation. This implies not merely that we are not to take seriously justice, morality and truth, but that there is really nothing in what is highest and best. In short it amounts to this, that irony contradicts and annihilates itself as manifested in individuals, characters and actions, and consequently is an irony which overreaches itself[129]. This mode or art-type, abstractly considered, approaches closely to the principle of comedy. At the same time we ought fundamentally to distinguish the comic from the ironical as thus associated. For the comic must be limited to the making null

what is essentially itself of no worth, that is to say, a false and contradictory appearance, a whim, for instance, a piece of egotism, a particular caprice, as set over against a mighty passion; or even some principle, *assumed* to be efficacious, or rigid maxims may be thus exposed in their nullity. But it is wholly a different matter, when what is in fact moral and true, generally something with really substantive core, is asserted in an individual and through the same as essentially of no account. Such an individual is then nugatory and despicable in his character, and the weakness and absence of character are thus introduced into the representation. In this distinction, therefore, between the ironical and the comic the point of real importance is what is the nature of the *content* which is destroyed. They are in the case of irony evil, good for nothing subjects, persons unable to hold staunchly to their fixed and important purposes, only too ready to give it up and to permit its destruction within them. Your "Irony" loves this irony of the characterless. For true character implies on the one hand an essential substance in its purpose, and on the other adherence to such a purpose, so that individuality would be rifled of its veritable existence, if it was compelled to let it drop and give it up. This doggedness and stability constitutes the keynote of character. Cato can only live as Roman and republican. Now if irony is made the keynote of the representation, we have the extreme antithesis to art accepted as the true principle of the work of art. For what we have here is in part insipid figures, in part figures that have neither content nor defined position[130]. Seeing that what is of substance in them is proved to be an illusion. And, last of all, we have into the bargain those yearning floods and unresolved contradictions of the soul. Compositions of this kind are not likely to arouse real interest. And for this very reason it is precisely from the advocates of this Irony that we have the continuous round of lament over the public's want of critical sense, artistic insight and genius, which of course cannot appreciate the lofty ways of such

an Irony; in other words what the public does not like is this very mediocrity, which is the half of it mere trifling[131], and the other half without distinctive character. And it is right that these spectre-like, moon-shine gazing natures are no favourites; it is a comfort to think that this insincerity and hypocrisy is not in fashion, and that what men, on the contrary, demand imperatively are full and veritable interests, and no less so characters which remain true to the weighty substance at their core. We may add as a matter of historical interest that it was Solger and Ludwig Tieck who above all accepted irony as the highest principle of art.

This is not the place to speak of Solger at the length he really merits; and I must content myself with a few general remarks. Solger was not, as the others were, satisfied with a superficial philosophical culture. A truly speculative impulse of his innermost nature made him probe the very depths of the philosophical idea. And in doing so he came upon the dialectical phase of the Idea, that transition point which I call the infinite absolute negativity, the activity of the idea in its negation of itself as infinite and universal, in order to pass into finiteness and particularity, and with no less truth once more in order to annul this negation, and in so doing to establish again the universal and infinite within the finite and particular. Solger did not get beyond this negativity; and unquestionably it is a *phase*[132] in the speculative idea; but nevertheless, as exclusively conceived in this dialectic unrest and dissolution of the infinite no less than the finite, it is *only* such a phase contributory, and not, as Solger imagined, the *Entire Idea.* Unfortunately Solger's life was too early broken off to permit him to grasp the concrete evolvement of the philosophical Idea in all it implies. And so he never got beyond this aspect of negativity, which possesses an affinity with the dissolution by irony of all that is determinate no less than essentially substantive, a negative movement which he identified with the principle of artistic activity. Yet in the actual conditions of his life, and with

due reference to the stability, seriousness, and sterling qualities of his character, he was neither himself an ironic artist in the sense we have previously described, nor was his really profound instinct for true works of art, a sense which a long course of study of art had developed greatly, either of such an ironical character. So much we will venture in the vindication of Solger, whose life, philosophy, and actual contributions to art merit being wholly kept separate from the apostles of irony previously named.

With regard to Ludwig Tieck, his culture, too, dates from that period in which Jena was the literary centre. Tieck and others who belonged to these superior people are on excellent terms with such modes of expression, without being able to tell us much what they mean. Thus Tieck always insists on the importance of Irony. But when it comes to delivering judgment on great works of art, though his recognition and description of their greatness is no doubt beyond reproach, yet if one imagines that in any particular example — let us say "Romeo and Juliet" — we have the opportunity put for an explanation of that in which here the irony consists, we are wide of the mark. We hear nothing more whatever about Irony.

V[133]

1. After the above introductory observations we may now pass on to the consideration of our subject itself. We are, however, still within the introduction; and being so I do not propose to attempt anything more than indicate by way of sketch the main outlines of the general course of the scientific inquiry which is to follow it. Inasmuch, however, as we have referred to art as issuing from the absolute Idea itself, and, indeed, have assigned as its end the sensuous presentation of the Absolute itself, it will be incumbent on us to conduct this survey of the entire field in such a way,

as at least to disclose generally, how the particular parts originate in the notional concept of the beauty of art. We must therefore attempt to awaken some idea of this notion in its broadest significance.

It has already been stated that the content of art is the Idea, and the form of its display the configuration of the sensuous or plastic image. It is further the function of art to mediate these two aspects under the reconciled mode of free totality. The *first* determinant implied by this is the demand that the content, which has to secure artistic representation, shall disclose an essential capacity for such display. If this is not so all that we possess is a defective combination. A content that, independently, is ill adapted to plastic form and external presentment is compelled to accept this form, or a matter that is of itself prosaic in its character is driven to make the best it can of a mode of presentation which is antagonistic to its nature.

The *second* requirement, which is deducible from the first, is the demand that the content of art should be nothing essentially abstracts This does not mean, however, that it should be merely concrete in the sense that the sensuous object is such in its contrast to all that is spiritual and the content of thought, regarding these as the essentially simple and abstract. Everything that possesses truth for Spirit; no less than, as part of Nature, is essentially concrete, and, despite its universality, possesses both ideality[134] and particularity essentially within it. When we state, for example, of God that he is simple One, the Supreme Being as such, we have thereby merely given utterance to a lifeless abstraction of the irrational understanding. Such a God, as He is thus not conceived in His concrete truth, can supply no content for art, least of all plastic art. Consequently neither the Jews nor the Turks have been able to represent their God, who is not even an abstraction of the understanding in the above sense, under the positive mode in which Christians have represented Him. For in Christianity God is conceived in His Truth, and as such essentially concrete, as personality[135], as the

subjective focus of conscious life, or, more accurately defined, as Spirit. And what He is as Spirit is made explicit to the religious apprehension as a trinity of persons, which at the same time are, in their independence, regarded as One. Here is essentiality, universality, and particularity, no less than their reconciled unity, and it is only a unity such as this which gives us the concrete. And inasmuch as a content, in order to unveil truth at all, must be of this concrete character, art makes the demand for a like concreteness, and, for this reason, that a purely abstract universal does not in itself possess the property to proceed to particularity and external manifestation, and to unity with itself therein.

If, then, a sensuous form and configuration is to be correspondent with a true and therefore concrete content, such must in the third place likewise be as clearly individual, entirely concrete and a self-enclosed unity. This character of concreteness, predicable of both aspects of art, the content no less than the representation, is just the point in which both coalesce and fall in with one another. The natural form of the human body is, for example, such a sensuous concrete capable of displaying Spirit in its essential concreteness and of adapting itself wholly to such a presentment. For which reason we must quit ourselves of the idea that it is a matter of mere accident that an actual phenomenon of the objective world is accepted as the mode in which to embody such a form coalescent with truth. Art does not lay hold of this form either because it is simply there or because there is no other. The concrete content itself implies the presence of external and actual, we may even add the sensuous appearance. But to make this possible this sensuous concrete, which is essentially impressed with a content that is open to mind, is also essentially addressed to the inward conscious life, and the external mode of its configuration, whereby it is visible to perception and the world of idea, has for its aim the being there exclusively for the soul and mind of

man. This is the sole reason that content and artistic conformation are dovetailed one into the other. The *purely* sensuous concrete, that is external Nature as such, does not exclusively originate in such an end. The variously coloured plumage of birds is resplendent unseen; the notes of this song are unheard. The Cereus[136], which only blossoms for a night, withers away without any admiration from another in the wilderness of the southern forests; and these forests, receptacles themselves of the most beautiful and luxuriant vegetation, with the richest and most aromatic perfumes, perish and collapse in like manner unenjoyed. The work of art has no such naïve and independent being. It is essentially a question, an address to the responding soul of man, an appeal to affections and intelligence.

Although the endowment by art of sensuous shape is not in this respect accidental, yet on the other hand it is not the highest mode of grasping the spiritually concrete. Thought is a higher mode of presentment than that of the sensuous concrete. Though abstract in a relative sense; yet it must not be one-sided, but concrete thinking, in order to be true and rational. The extent to which a definite content possesses for its appropriate form sensuous artistic representation, or essentially requires, in virtue of its nature, a higher and more spiritual embodiment is a question of difference exemplified at once if we compare the Greek gods with God as conceived under Christian ideas. The Greek god is not abstract, but individual, and is in close association with the natural human form. The Christian God is also, no doubt, a concrete personality, but under the mode of pure spiritual actuality, who is cognized as Spirit and in Spirit[137]. His medium of determinate existence is therefore essentially knowledge of the mind and not external natural shape, by means of which His representation can only be imperfect, and not in the entire depths of His idea or notional concept.

Inasmuch, however, as it is the function of art to represent the Idea to immediate vision in sensuous shape and not in the form of thought and pure

spirituality in the strict sense, and inasmuch as the value and intrinsic worth of this presentment consists in the correspondence and unity of the two aspects, that is the Idea and its sensuous shape, the supreme level and excellence of art and the reality, which is truly consonant with its notion, will depend upon the degree of intimacy and union with which idea and configuration appear together in elaborated fusion. The higher truth consequently is spiritual content which has received the shape adequate to the conception of its essence; and this it is which supplies the principle of division for the philosophy of art. For before the mind can attain to the true notion of its absolute essence, it is constrained to traverse a series of stages rooted in this very notional concept; and to this course of stages which it unfolds to itself, corresponds a coalescent series, immediately related therewith, of the plastic types of art, under the configuration whereof mind as art-spirit presents to itself the consciousness of itself[138].

This evolution within the art-spirit has further itself two sides in virtue of its intrinsic nature. *First*, that is to say, the development is itself a spiritual and universal one; in other words there are the definite and comprehensive views of the world[139] in their series of gradations which give artistic embodiment to the specific but widely embracing consciousness of Nature, man, and God. *Secondly*, this ideal or *universal* art-development has to provide for itself immediate existence and sensuous configuration, and the definite modes of this art-actualization in the sensuous medium are themselves a totality of necessary distinctions in the realm of art — that is to say, they are the *particular types* of art. No doubt the types of artistic configuration on the one hand are, in respect to their spirituality, of a general character, and not restricted to any one material, and the sensuous existence is similarly itself of varied multiplicity of medium. Inasmuch, however, as this material potentially possesses, precisely as the mind or

spirit does, the Idea for its inward soul or significance, it follows that a definite sensuous involves with itself a closer relation and secret bond of association with the spiritual-distinctions and specific types of artistic embodiment[140].

Relatively to these points of view our philosophy will divided into three fundamental parts.

First, we have a *general* part. It has for its content object the universal Idea of fine art, conceived here as the Ideal, together with the more elaborated relation under which it is placed respectively to Nature and human artistic production.

Secondly, we have evolved from the notional concept of the beauty of art a *particular* part, in so far as the essential distinctions, which this idea contains in itself, are unfolded in a graduated series of *particular* modes of configuration[141].

Thirdly, there results a *final* part which has to consider the particularized content of fine art itself. It consists in the advance of art to the sensuous realization of its shapes and its consummation in a system of the several arts and their genera and species.

2. In respect to the first and second of these divisions it is important to recollect, in order to make all that follows intelligible, that the Idea, viewed as the beautiful in art, is not the Idea in the strict sense, that is as a metaphysical Logic apprehends it as the Absolute. It is rather the Idea as carried into concrete form in the direction of express realization, and as having entered into immediate and adequate unity with such reality. For the *Idea as such*, although it is both potentially and explicitly true, is only truth in its universality and not as yet presented in objective embodiment. The Idea as fine art, however, is the Idea with the more specific property of being essentially individual reality, in other words, an individual configuration of reality whose express function it is to make manifest the

Idea — in its appearance. This amounts to the demand that the Idea and its formative configuration as concrete realization must be brought together under a mode of complete adequacy. The Idea as so conceived, a reality, that is to-say, moulded in conformity with the notional concept of the Idea, is the Ideal. The problem of such consonancy might, in the first instance, be understood in the wholly formal sense that the Idea might be any idea so long as the actual shape, it matters not what the shape might be, represented this particular Idea and no other. In that case, however, the required truth of the Ideal is a fact simply interchangeable with mere correctness, a correctness which consists in the expression of any significance in a manner adapted to it, provided that its meaning is thereby directly discoverable in the form. The Ideal, however, is not to be thus understood. According to the standard or test of its own nature any content whatever can receive adequate presentation, but it does not necessarily thereby possess a claim to be the fine art of the Ideal. Nay, more, in comparison with ideal beauty the presentation will even appear defective. And in this connection we may once for all observe — though actual proof is reserved to a later stage — that the defects of a work of art are not invariably to be attributed to defects of executive skill. *Defectiveness of form* arises also from *defectiveness of content*. The Chinese, Hindoos, and Egyptians, for example, in their artistic images, sculptured deities and idols, never passed beyond a formless condition, or a definition of shape that was vicious and false, and were unable to master true beauty. And this was so for the reason that their mythological conceptions, the content and thought of their works of art, were still essentially indeterminate, or only determinate in a false sense, did not, in fact, attain to a content which was absolute in itself. Viewed in this sense the excellence of works of art is so much the greater in the degree that their content and thought is ideal and profound. And in affirming this we have not merely in our mind the degree of executive mastery displayed in

the grasp and imitation of natural form as we find it in the objective world. For in certain stages of the artistic consciousness and its reproductive effects the desertion and distortion of the conformations of Nature is not so much due to unintentional technical inexperience or lack of ability, as it is to deliberate alteration, which originates in the mental content itself, and is demanded by the same. From this point of view there is therefore imperfect art, which, both in technical and other respects, may be quite consummate in its *own specific sphere*, yet if tested with the true notion of art and the Ideal can only appear as defective. Only in the highest art are the Idea and the artistic presentation truly consonant with one another in the sense that the objective embodiment of the Idea is in itself essentially and as realized the true configuration, because the content of the Idea thus expressed is itself in truth the genuine content. It is appertinent to this, as already noted, that the Idea must be defined in and through itself as concrete totality, thereby essentially possessing in itself the principle and standard of its particularization and definition as thus manifested objectively. For example, the Christian imagination will only be able to represent God in human form and with man's means of spiritual expression, because it is herein that God Himself is fully known in Himself as mind or Spirit. Determinacy is, as it were, the bridge to phenomenal presence. Where this determinacy is not totality derived from the Idea itself, where the Idea is not conceived as that which is self-definitive and self-differentiating, it remains abstract and possesses its definition, and with it the principle for the particular mode of embodiment adapted to itself not within itself but as something outside it. And owing to this the Idea is also still abstract and the configuration it assumes is not as yet posited by itself. The Idea, however, which is essentially concrete, carries the principle of its manifestation in itself, and is thereby the means of its own free manifestation. Thus it is only the truly

concrete Idea that is able to evoke the true embodiment, and this appropriate coalescence of both is the Ideal.

3. But inasmuch as in this way the Idea is concrete unity, this unity can only enter the artistic consciousness by the expansion and further mediation of the particular aspects of the Idea; and it is through this evolution that the beauty of art receives a *totality of particular stages and forms.* Therefore, after we have considered fine art in its essence and on its own account, we must see how the beautiful in its entirety breaks up into its particular determinations. This gives, as our second part, the *doctrine of the types of art.* The origin of these types is to be found in the varied ways under which the Idea is conceived as the content of art; it is by this means that a distinction in the mode of form under which it manifests itself is conditioned. These types are therefore simply the different modes of relation which obtain between the Idea and its configuration, relations which emanate from the Idea itself, and thereby present us with the general basis of division for this sphere. For the principle of division must always be found in the notional concept, the particularization and division of which it is.

We have here to consider *three* relations of the Idea to its external process of configuration.

(*a*) *First*, the origin of artistic creation proceeds from the Idea when, being itself still involved in defective definition and obscurity, or in vicious and untrue determinacy, it becomes embodied in the shapes of art. As indeterminate it does not as yet possess in itself that individuality which the Ideal demands. Its abstract character and one-sidedness leaves its objective presentment still defective and contingent. Consequently this first type of art is rather a mere search after plastic configuration than a power of genuine representation. The Idea has not as yet found the formative principle within itself, and therefore still continues to be the mere effort and

strain to find it. We may in general terms describe this form as the *symbolic* type of art. The abstract Idea possesses in it its external shape outside itself in the purely material substance of Nature, from which the shaping process proceeds, and to which in its expression it is entirely yoked. Natural objects are thus in the first instance left just as they are, while, at the same time the substantive Idea is imposed upon them as their significance, so that their function is henceforth to express the same, and they claim to be interpreted, as though the Idea itself was present in them. A rationale of this is to be found in the fact that the external objects of reality do essentially possess an aspect in which they are qualified to express a universal import. But as a completely adequate coalescence is not yet possible, all that can be the outcome of such a relation is an *abstract attribute*, as when a lion is understood to symbolize strength.

On the other hand this abstractness of the relation makes present to consciousness no less markedly how the Idea stands relatively to natural phenomena as an alien; and albeit it expatiates in all these shapes, having no other means of expression among all that is real, and seeks after itself in their unrest and defects of genuine proportion, yet for all that it finds them inadequate to meet its needs. It consequently exaggerates natural shapes and the phenomena of Nature in every degree of indefinite and limitless extension; it flounders about in them like a drunkard, and seethes and ferments, doing violence to their truth with the distorted growth of unnatural shapes, and strives vainly by the contrast, hugeness, and splendour of the forms accepted to exalt the phenomena to the plane of the Idea. For the Idea is here still more or less indeterminate, and unadaptable, while the objects of Nature are wholly definite in their shape.

Hence, on account of the incompatibility of the two sides of ideality and objective form to one another, the relation of the Idea to the other becomes a *negative* one. The former, being in its nature ideal, is unsatisfied with such an embodiment, and posits itself as its inward or ideally universal substance under a relation of *sublimity* over and above all this inadequate superfluity of natural form. In virtue of this sublimity the natural phenomena, of course, and the human form and event are accepted and left simply as they are, but at the same time, recognized as unequal to their significance, which is exalted far above all earthly content.

These features constitute in general terms the character of the primitive artistic pantheism of the East, which, on the one hand, charges the meanest objects with the significance of the absolute Idea, or, on the other, compels natural form, by doing violence to its structure, to express its world-ideas. And, in consequence, it becomes bizarre, grotesque, and deficient in taste, or turns the infinite but abstract freedom of the substantive Idea contemptuously against all phenomenal existence as alike nugatory and

evanescent. By such means the significance cannot be completely presented in the expression, and despite all straining and endeavour the final inadequacy of plastic configuration to Idea remains insuperable. Such may be accepted as the first type of art — symbolic art with its yearning, its fermentation, its mystery, and sublimity.

(*b*) In the *second* type of art, which we propose to call "*Classical*," the twofold defect of symbolic art is annulled. Now the symbolic configuration is imperfect, because, first, the Idea here only enters into consciousness in *abstract* determinacy or indeterminateness: and, secondly, by reason of the fact that the coalescence of import with embodiment can only throughout remain defective, and in its turn also wholly abstract. The classical art-type solves both these difficulties. It is, in fact, the free and adequate embodiment of the Idea in the shape which, according to its notional concept, is uniquely appropriate to the Idea itself. The Idea is consequently able to unite in free and completely assonant concord with it. For this reason the classical type of art is the first to present us with the creation and vision of the complete Ideal, and to establish the same as realized fact.

The conformability, however, of notion and reality in the classical type ought not to be taken in the purely *formal* sense of the coalescence of a content with its external form, any more than this was possible in the case of the Ideal. Otherwise every copy from Nature, and every kind of portrait, every landscape, flower, scene, and so forth, which form the aim of the presentment, would at once become classical in virtue of the fact of the agreement it offers between such content and form. In classical art, on the contrary, the characteristic feature of the content consists in this, that it is itself concrete Idea, and as such the concrete spiritual; for it is only that which pertains to Spirit which is veritable ideality[142]. To secure such a content we must find out that in Nature which on its own account is that which is essentially and explicitly appropriate to the spiritual. It must be the

original notion itself[143], which has invented the form for concrete spirituality, and now the *subjective* notion — in the present case the spirit of art — has merely *discovered* it, and made it, as an existence possessed of natural shape, concordant with free and individual spirituality. Such a configuration, which the Idea essentially possesses as spiritual, and indeed as individually determinate spirituality, when it must perforce appear as a temporal phenomenon, is the *human form.* Personification and anthropomorphism have frequently been abused as a degradation of the spiritual. But art, in so far as its function is to bring to vision the spiritual in sensuous guise, must advance to such anthropomorphism, inasmuch as Spirit is only adequately presented to perception in its bodily presence. The transmigration of souls in this respect an abstract conception[144], and physiology ought to make it one of its fundamental principles, that life has necessarily, in the course of its evolution, to proceed to the human form, for the reason that it is alone the visible phenomenon adequate to the expression of intelligence.

The human bodily form, then, is employed in the classical type of art not as purely sensuous existence, but exclusively as the existence and natural shape appropriate to mind. It has therefore to be relieved of all the defective excrescences which adhere to it in its purely physical aspect, and from the contingent finiteness of its phenomenal appearance. The external shape must in this way be purified in order to express in itself the content adequate for such a purpose; and, furthermore, along with this, that the coalescence of import and embodiment may be complete, the spirituality which constitutes the content must be of such a character that it is completely able to express itself in the natural form of man, without projecting beyond the limits of such expression within the sensuous and purely physical sphere of existence. Under such a condition Spirit is at the same time defined as particular, the spirit or mind of man, not as simply

absolute and eternal. In this latter case it is only capable of asserting and expressing itself as intellectual being[145].

Out of this latter distinction arises, in its turn, the defect which brings about the dissolution of the classical type of art, and makes the demand for a third and higher form, namely the *romantic* type.

(*c*) The romantic type of art annuls the completed union of the Idea and its reality, and occurs, if on a higher plane, to the difference and opposition of both sides, which remained unovercome in symbolic art. The classical type of art no doubt attained the highest excellence of which the sensuous embodiment of art is capable. The defect, such as it is, is due to the defect which obtains in art itself throughout, the limitations of its entire province, that is to say. The limitation consists in this, that art in general and, agreeably to its fundamental idea, accepts for its object Spirit, the notion of which is infinite concrete universality, under the guise of sensuously concrete form. In the classical type it sets up the perfected coalescence of spiritual and sensuous existence as adequate conformation of both. As a matter of fact, however, in this fusion mind itself is not represented agreeably to its *true notional concept.* Mind is the infinite subjectivity of the Idea, which as absolute inwardness[146], is not capable of freely expanding in its entire independence, so long as it remains within the mould of the bodily shape, fused therein as in the existence wholly congenial to it.

To escape from such a condition the romantic type of art once more cancels that inseparable unity of the classical type, by securing a content which passes beyond the classical stage and its mode of expression. This content, if we may recall familiar ideas — is coincident with what Christianity affirms to be true of God as Spirit, in contrast to the Greek faith in gods which forms the essential and most fitting content of classical art. In Greek art the concrete ideal substance is potentially, but not as fully realized, the unity of the human and divine nature; a unity which for the

very reason that it is purely *immediate* and not wholly explicit, is manifested without defect under an immediate and *sensuous* mode. The Greek god is the object of naïve intuition and sensuous imagination. His shape is therefore the bodily form of man. The sphere of his power and his being is individual and individually limited; and in his opposition to the individual person[147] is an essence and a power with whom the inward life of soul[148] is merely potentially in unity, but does not itself possess this unity as inward subjective knowledge. The higher stage is the *knowledge* of this *implied* unity, which in its latency the classical art-type receives as its content and is able to perfectly represent in bodily shape. This elevation of mere potentiality into self-conscious knowledge constitutes an enormous difference. It is nothing less than the infinite difference which, for example, separates man generally from the animal creation. Man is animal; but even in his animal functions he is not restricted within the potential sphere as the animal is, but becomes conscious of them, learns to understand them, and raises them — as, for instance, the process of digestion — into self-conscious science. By this means man dissolves the boundaries of his merely potential immediacy; in virtue of the very fact that he knows himself to be animal he ceases to be merely animal, and as mind is endowed with self-knowledge.

If, then, in this way the unity of the human and divine nature, which in the previous stage was potential, is raised out of this immediate into a self-conscious unity, it follows that the genuine medium for the reality of this content is no longer the sensuous and immediate existence of what is spiritual, that is, the physical body of man, but the *self-aware* inner life of *soul itself.* Now it is Christianity — for the reason that it presents to mind God as *Spirit*, and not as the particular individual spirit, but as absolute in spirit and in truth — which steps back from the sensuousness of imagination into the inward life of reason, and makes *this* rather than *bodily*

form the medium and determinate existence of its content. So also, the unity of the human and divine nature is a conscious unity exclusively capable of realization by means of *spiritual* knowledge, and in *Spirit.* The new content secured thereby is consequently not indefeasibly bound up with the sensuous presentation, as the mode completely adequate, but is rather delivered from this immediate existence, which has to be hypostatized as a negative factor, overcome and reflected back into the spiritual unity. In this way romantic art must be regarded as art transcending itself, albeit within the boundary of its own province, and in the form of art itself.

We may therefore briefly summarize our conclusion that in this third stage the object of art consists in the free and concrete presence of spiritual activity[149], whose vocation it is to appear as such a presence or activity for the inner world of conscious intelligence. In consonance with such an object art cannot merely work for sensuous perception. It must deliver itself to the inward life, which coalesces with its object simply as though this were none other than itself[150], in other words, to the intimacy of soul, to the heart, the emotional life, which as the medium of Spirit itself essentially strives after freedom, and seeks and possesses its reconciliation only in the inner chamber of spirit. It is this inward or ideal world which constitutes the content of the romantic sphere: it will therefore necessarily discover its representation as such inner idea or feeling, and in the show or appearance of the same. The world of the soul and intelligence celebrates its triumph over the external world, and, actually in the medium of that outer world, makes that victory to appear, by reason of which the sensuous appearance sinks into worthlessness.

On the other hand, this type of art, like every other, needs an external vehicle of expression. As already stated, the spiritual content has here withdrawn from the external world and its immediate unity into its own world. The sensuous externality of form is consequently accepted and

represented, as in the symbolic type, as unessential and transient; furthermore the subjective finite spirit and volition is treated in a similar way; a treatment which even includes the idiosyncrasies or caprice of individuals, character, action, or the particular features of incident and plot. The aspect of external existence is committed to contingency and handed over to the adventurous action of imagination, whose caprice is just as able to reflect the facts given *as* they are[151], as it can change the shapes of the external world into a medley of its own invention and distort them to mere caricature. For this external element has no longer its notion and significance in its own essential province, as in classical art. It is now discovered in the emotional realm, and this is manifested in the medium of that realm itself rather than in the external and *its* form of reality, and is able to secure or to recover again the condition of reconciliation with itself in every accident, in all the chance circumstance that falls into independent shape, in all misfortune and sorrow, nay, in crime itself.

Hence it comes about that the characteristics of symbolic art, its indifference, incompatibility and severance of Idea from configurative expression, are here reproduced once more, if with essential difference. And this difference consists in the fact that in romantic art the Idea, whose defectiveness, in the case of the symbol, brought with it the defect of external form, has to display itself as Spirit and in the medium of soul-life as essentially self-complete. And it is to complete fundamentally this higher perfection that it withdraws itself from the external element, It can, in short, seek and consummate its true reality and manifestation nowhere but in its own domain.

This we may take to be in general terms the character of the symbolic, classical, and romantic types of art, which in fact constitute the three relations of the Idea to its embodiment in the realm of human art. They

consist in the aspiration after, the attainment and transcendency of the Ideal, viewed as the true concrete notion of beauty.

4. In contrast to these two previous divisions of our subject the *third* part presupposes the notional concept of the Ideal, and the universal art-types. It in other words consists in their realization through specific sensuous media. We have consequently no longer to deal with the inner or ideal evolution of the beauty of art in conformity with its widest and most fundamental determinations. What we have now before us to consider is how these ideal determinants pass into actual existence, how they are distinguishable in their external aspect, and how they give an independent and a realized shape to every element implied in the evolution of this Idea of beauty as *a work of art*, and not merely as a *universal type.* Now it is the peculiar differences immanent in the Idea of beauty which are carried over by it into external existence. For this reason in this third fundamental division these general art-types must themselves supply the basic principle for the articulation and definition of the *particular arts.* Or, to put the same thing another way, the several species of art possess in themselves the same essential differences, which we have already become acquainted with as the universal art-types. *External* objectivity, however, to which these types are subjected in a sensuous and consequently *specific* material, necessitates the differentiation of these types into diverse and independent modes of realization, in other words, those of particular arts. Each general type discovers its determinate character in one determinate external material or medium, in which its adequate presentation is secured under the manner it prescribes. But, from another point of view, these types of art, inasmuch as their definition is none the less consistent with the fact of the *universality* of their typical import, break through the boundaries of their *specific* realization in some definite art-species, and achieve an existence in other arts no less, although their position in such is of subordinate importance.

For this reason, albeit the particular arts belong specifically to one of these general art-types respectively, the *adequate* external embodiment whereof they severally constitute, yet this does not prevent them, each after its own mode of external configuration, from representing the totality of these art-types[152]. To summarize, then, in this third principal division we are dealing with the beauty of art, as it unveils itself in a world of realized beauty by means of the arts and their creations. The content of this world is the beautiful, and the true beautiful, as we have seen, is spiritual being in concrete form, the Ideal; or apprehended with still more intimacy it is the absolute mind and truth itself. This region of divine truth artistically presented to sensuous vision and emotion forms the centre of the entire world of art. It is the independent, free and divine Image[153], which has completely appropriated the externality of form and medium, and now wears them simply as the means of its self-manifestation. Inasmuch, however, as the beautiful is unfolded here as *objective* reality, and in this process is differentiated into particular aspects and phases, this centre posits its extremes, as realized in their peculiar actuality, in antithetical relation to itself. Thus one of these extremes consists of an objectivity as yet devoid of mind, which we may call the natural environment of God. Here the external element, when it receives form, remains as it was, and does not possess its spiritual aim and content in itself, but in another[154]. The other extreme is the divine as inward, something known, as the manifold particularized *subjective* existence of Deity. It is the truth as operative and vital in sense, soul, and intelligence of particular persons, which does not persist as poured forth into its mould of external shape, but returns into the inward life of individuals. The Divine is under such a mode at once distinguishable from its pure manifestation as Godhead, and passes itself thereby into the variety of particularization which belongs to every kind of particular subjective knowledge, feeling, perception, and emotion. In the analogous province of

religion with which art, at its highest elevation, is immediately connected, we conceive the same distinction as follows. First, we imagine the natural life on Earth in its finitude as standing on one side; but then, secondly, the human consciousness accepts God for its object, in which the distinction between objectivity and subjectivity falls away; then, finally, we advance from God as such to the devotion of the *community*, that is to God as He is alive and present in the subjective consciousness. These three fundamental modifications present themselves in the world of art in independent evolution.

(*a*) The *first* of the particular arts with which, according to their fundamental principle, we have to start is architecture considered as a fine art. Its function consists in so elaborating the external material of inorganic Nature that the same becomes intimately connected with Spirit as an artistic and external environment. Its medium is matter itself as an external object, a heavy mass that is subject to mechanical laws; and its forms persist as the forms of inorganic Nature co-ordinated with the relations of the abstract understanding such as symmetry and so forth. In this material and in these forms the Ideal is incapable of realization as concrete spirituality, and the reality thus presented remains confronting the Idea as an external fabric with which it enters into no fusion, or has only entered so far as to establish an abstract relation. And it is in consequence of this that the fundamental type of the art of building is that of *symbolism.* Architecture is in fact the first pioneer on the highway toward the adequate realization of Godhead. In this service it is put to severe labour with objective nature, that it may disengage it by its effort from the confused growth of finitude and the distortions of contingency. By this means it levels a space for the God, informs His external environment, and builds Him His temple, as a fit place for the concentration of Spirit, and its direction to the absolute objects of intelligent life. It raises an enclosure for the congregation of those

assembled, as a defence against the threatening of the tempest, against rain, the hurricane, and savage animals. It in short reveals the will thus to assemble, and although under an external relation, yet in agreement with the principles of art. A significance such as this it can to a greater or less extent import into its material and its forms, in proportion as the determinate content of its fabric, which is the object of its operations and effort, is more or less significant, is more concrete or more abstract, more profound in penetrating its own essential depth, or more obscure and superficial. Indeed architecture may in this respect proceed so far in the execution of such a purpose as to create an adequate artistic existence for such an ideal content in its very forms and material. In doing so, however, it has already passed beyond its peculiar province and is diverted into the stage immediately above it of sculpture. For the boundary of sculpture lies precisely, in this that it retains the spiritual as an inward being which persists in direct contrast to the external embodiment of architecture. It can consequently merely point to that which is absorbed in soul-life as to something external to itself.

(*b*) Nevertheless, as above explained, the external and inorganic world is purified by architecture, it is co-ordinated under symmetrical laws, and made cognate with mind, and as a result the temple of God, the house of his community, stands before us. Into this temple, in the *second* place, the God himself enters in the lightning-flash of individuality which smites its way into the inert mass, permeating the same with its presence. In other words the infinite[155] and no longer purely symmetrical form belonging to intelligence brings as it were to a focus and informs the shape in which it is most at home. This is the task of *sculpture*. In so far as in it the inward life of Spirit, to which the art of architecture can merely point away to, makes its dwelling within the sensuous shape and its external material, and to the extent that these two sides come into plastic communion with one another

in such a manner that neither is predominant, sculpture receives as its fundamental type the *classical* art-form.

For this reason the sensuous element on its own account admits of no expression here which is not affected by spiritual affinities[156], just as, conversely, sculpture can reproduce with completeness no spiritual content, which does not maintain throughout adequate presentation to perception in bodily form. What sculpture, in short, has to do is to make the presence of Spirit stand before us in its bodily shape and in immediate union therewith at rest and in blessedness; and this form has to be made vital by means of the content of spiritual individuality. The external sensuous material is consequently no longer elaborated either in conformity with its mechanical quality alone, as a mass of weight, nor in shapes of the inorganic world simply, nor in entire indifference to colour, etc. It is carried into the ideal forms of the human figure, and, we may add, in the completeness of all three spatial dimensions. In other words and relatively to such a process we must maintain for sculpture that in it the inward or ideal content of Spirit are first revealed in their eternal repose and essential self-stability. To such repose and unity with itself there can only correspond that external shape which itself persists in such unity and repose. And this condition is satisfied by configuration viewed in its *abstract spatiality.*[157] The spirit which sculpture represents is that which is essentially sound, not broken up in the play of chance conceits and passions; and for this reason its external form also is not dissolved in the manifold variety of appearance, but exhibits itself under this one presentment only as the abstraction of space in the totality of its dimensions.

Assuming, then, that the art of architecture has executed its temple, and the hand of sculpture has placed therein the image of the god, we have in the *third* place to assume the *community* of the faithful as confronting the god thus presented to vision in the wide chambers of his dwelling-place.

Now this community is the spiritual reflection into its own world of that sensuous presence, the subjective and inward animating life of soul, in its union with which, both for the artistic content and the external material which manifests it, the determining principle may be identified with particularization in varied shapes and qualities, individualization and the life of soul[158] which they imply. The downright and solid fact of unity the god possesses in sculpture breaks up into the multiplicity of a world of particular souls[159], whose union is no longer sensuous but wholly ideal.

Here for the first time God Himself is revealed as veritably Spirit — viz., the Spirit revealed in His community. Here at last He is seen apprehended as this moving to-and-fro, as this alternation between His own essential unity and His realization in the knowledge of individual persons and that separation which it involves, as also in the universal spiritual, being[160] and union of the many. In such a community God is disengaged from the abstraction of His unfolded self-seclusion and self-identity, no less than from the immediate absorption in bodily shape, in which He is presented by sculpture. He is, in a word, lifted into the actual sphere of spiritual existence and knowledge, into the reflected appearance, whose manifestation is essentially inward and the life of heart and soul. Thereby the higher content is now the nature of Spirit, and that in its ultimate or absolute shape. But at the same time the separation to which we have alluded displays this as *particular* spiritual being, a specific emotional life. Moreover, for the reason that the main thing here is not the untroubled repose of the God in himself[161], but his manifestation simply, the Being which is *for another*, self-revealment in fact, it follows that, on the plane we have now reached, all the varied content of human subjectivity in its vital movement and activity, whether viewed as passion, action, or event, or more generally the wide realm of human feeling, volition and its discontinuance, become one and all for their own sake objects of artistic representation.

Agreeably with such a content the sensuous element of art has likewise to show itself potentially adapted to such particularization and the display of such an inward content of heart and mind. Media of this description are supplied by colour, musical tones, and finally in sound as mere sign for ideal perceptions and conceptions; and we further obtain the means of realizing with the use of such media a content of this kind in the arts of painting, music, and poetry. Throughout this sphere the sensuous medium is found to be essentially disparate in itself and throughout posited[162] as ideal. In this way it responds in the highest degree to the fundamentally spiritual content of art, and the coalescence of spiritual significance and sensuous material attains a more intimate union than was possible either in architecture or sculpture. At the same time such a union is necessarily more near to soul-life, leaning exclusively to the subjective side of human experience; one which, in so far as form and content are thus constrained to particularization and to posit their result as ideal, can only be actually effected at the expense of the objective universality of the content as also of the fusion with the immediately sensuous medium[163].

The arts, then, which are lifted into a higher strain of ideality, abandoning as they do the symbolism of architecture and the classical Ideal of sculpture, accept their predominant type from the *romantic* art-form; and these are the arts most fitted to express its mode of configuration. They are, however, a totality of arts, because the romantic type is itself essentially the most concrete.

(*c*) The articulation of this *third sphere* of the particular arts may be fixed as follows:

(*α*) The *first* art which comes next to sculpture is that of painting. It avails itself for a medium of its content and the plastic configuration of the same of visibility as such, to the extent that it is differentiated in its own

nature, in other words is defined in the continuity of colour. No doubt the material of architecture and sculpture is likewise both visible and coloured. It is, however, not, as in painting, visibility in its pure nature, not the essentially simple light, which by its differentiating of itself in its opposition to darkness, and in association with that darkness gives rise to colour[164]. This quality of visibility made essentially ideal[165] and treated as such no longer either requires, as in architecture, the abstractly mechanical qualities of mass as appropriate to materials of weight, nor, as is the case with sculpture, the complete dimensuration of spatial condition, even when concentrated into organic forms. The visibility and the making apparent, which belong to painting, possess differences of quality under a more ideal mode — that is, in the specific varieties of colour — which liberates art from the objective totality of spatial condition, by being limited to a plane surface.

On the other hand the content also attains the widest compass of particularity. Whatever can find a place in the human heart, as emotion, idea, and purpose, whatever it is capable of actually shaping — all such diversity may form part of the varied presentations of painting. The entire world of particular existence, from the most exalted embodiment of mind to the most insignificant natural fact, finds a place here. For it is possible even for finite Nature, in its particular scenes and phenomena, to form part of such artistic display, provided only that we have some reference to conscious life which makes it akin to human thought and emotion[166].

(β) The *second* art which continues the further realization of the romantic type and forms a distinct contrast to painting is that of *music.* Its medium, albeit still sensuous, yet proceeds into still profounder subjectivity and particularization. We have here, too, the deliberate treatment of the sensuous medium as ideal, and it consists in the negation and idealization into the isolated unity of a single point[167], the indifferent external

collocation of space[168], whose complete appearance is retained by painting and deliberately feigned in its completeness. This isolated point, viewed as this process of negation, is an essentially concrete and active process of cancellation within the determinate substance of the material medium, viewed, that is, as motion and vibration of the material object within itself and in its relation to itself. Such an inchoate ideality of matter, which no longer appears under the form of space, but as temporal ideality[169], is sound or tone. We have here the sensuous set down as negated, and its abstract visibility converted into audibility. In other words sound liberates the ideal content from its fetters in the material substance. This earliest[170] secured inwardness of matter and impregnation of it with soul-life supplies the medium for the intimacy and soul of Spirit — itself as yet indefinite — permitting, as it does, the echo and reverberation of man's emotional world through its entire range of feelings and passions. In this way music forms the centre of the romantic arts, just as sculpture represents the midway point of arrest between architecture and the arts of the romantic subjectivity. Thus, too, it forms the point of transition between the abstract, spatial sensuousness of painting and the abstract spirituality of poetry. Music carries within itself, like architecture, and in contrast to the emotional world simply and its inward self-seclusion, a relation of quantity conformable to the principles of the understanding and their modes of co-ordinated configuration[171].

(γ) We must look for our *third* and most spiritual type of artistic presentation among the romantic arts in that of *poetry.* The supreme characteristic of poetry consists in the power with which it brings into vassalage of the mind and its conceptions the sensuous element from which music and painting began to liberate art. For sound, the only remaining external material retained by poetry, is in it no longer the feeling of the sonorous itself, but is a mere sign without independent significance. And it

is, moreover, a sign of idea which has become essentially concrete, and not merely[172] of indefinite feeling and its subtle modes and gradations. And this is how sound develops into the Word, as essentially articulate voice, whose intention it is to indicate ideas and thoughts. The purely negative moment to which music advanced now asserts itself as the wholly concrete point, the point which is mind itself, the self-conscious individual, which produces from itself the infinite expansion of its ideas and unites the same with the temporal condition of sound. Yet this sensuous element, which was still in music immediately united to emotion, is in poetry separated from the content of consciousness. Mind, in short, here determines this content for its own sake and apart from all else into the content of idea; to express such idea it no doubt avails itself of sound, but employs it merely as a sign without independent worth or substance. Thus viewed, the sound here may be just as well reproduced by the mere letter, for the audible, like the visible, is here reduced to a mere indication of mind[173]. For this reason, the true medium of poetical representation is the poetical imagination and the intellectual presentation itself; and inasmuch as this element is common to all types of art it follows that poetry is a common thread through them all, and is developed independently in each. Poetry is, in short, the universal art of the mind, which has become essentially free, and which is not fettered in its realization to an externally sensuous material, but which is creatively active in the space, and time belonging to the inner world of ideas and emotion. Yet it is precisely in this its highest phase, that art terminates, by transcending itself; it is just here that it deserts the medium of a harmonious presentation of mind in sensuous shape and passes from the poetry of imaginative idea into the prose of thought.

Such we may accept as the articulate totality of the particular arts; they are the external art of architecture, the objective art of sculpture and the subjective arts of painting, music, and poetry. Many other classifications

than these have been attempted, for a work of art presents such a wealth of aspects, that it is quite possible, as has frequently been the case, to make first one and then another the basis of division. For instance, you may take the sensuous medium simply. Architecture may then be viewed as a kind of crystallization; sculpture, as the organic configuration of material in its sensuous and spatial totality; painting as the coloured surface and line, while in music, space, as such, passes over into the point or moment of time replete with content in itself, until we come finally to poetry, where the external medium is wholly suppressed into insignificance. Or, again, these differences have been viewed with reference to their purely abstract conditions of space and time. Such abstract divisions of works of art may, as their medium also may be consequentially traced in their characteristic features. They cannot, however, be worked out as the final and fundamental principle, because such aspects themselves derive their origins from a higher principle, and must therefore fall into subordination thereto.

This higher principle we have discovered in the types of art — symbolic, classical, and romantic — which are the universal stages or phases of the Idea of beauty itself.

Their relation to the individual arts in their concrete manifestation as embodiment is of a kind that these arts constitute the real and positive existence of these general art-types. For *symbolic* art attains its most adequate realization and most pertinent application in *architecture*, in which it expatiates in the full import of its notion, and is not as yet depreciated, as it were, into the merely inorganic nature dealt with by some other art. The *classical* type of art finds its unfettered realization, on the other hand, in sculpture, treating architecture merely as the enclosure which surrounds it, and being unable to elaborate painting and music into the wholly adequate[174] forms of its content. Finally, the *romantic* art-type is supreme in the products of painting and music, and likewise in poetical composition, as

their preeminent and unconditionally adequate modes of expression. Poetry is, however, conformable to all types of the beautiful, and its embrace reaches them all for the reason that the poetic imagination is its own proper medium, and imagination is essential to every creation of beauty, whatever its type may be.

To sum up, then, what the particular arts realize in particular works of art, are according to their fundamental conception, simply the universal types which constitute the self-unfolding Idea of beauty. It is as the external realization of this Idea that the wide Pantheon of art is being raised; and the architect and builder thereof is the spirit of beauty as it gradually comes to self-cognition, and to complete which the history of the world will require its evolution of centuries.

[1] The introduction begins as an introduction of lectures. But as the work is merely based to a large extent on notes for lectures, or on a manuscript which did not preserve the lectures as they were delivered, it will be found most convenient to ignore this fact, and in references to regard it simply as a written treatise.

[2] Hegel, alluding no doubt to the words of the Gospel, puts it "born and born again from mind (spirit)."

[3] It is assumed that such a fancy is seized and defined as such in separation from other experience.

[4] The sentence is slightly ironical.

[5] *Dem Scheine.*

[6] *Raisonnements*: a disparaging expression.

[7] Hegel here means the formal character, not the material on which it is imposed in the several arts.

[8] Hegel says, "as that which has no right to be," *das Nichtseyn sollende.*

[9] *Erscheine* as contrasted with *scheine.*

[10] *Das An-und-Fürsichseyende.* That which is explicitly to itself self-determinate being, no less than essentially such in its substantive right.

[11] *Besonnener Art.* Possibly Hegel means "one more compatible with common sense."

[12] I think by the words *kunst wieder hervorzurufen* Hegel rather means to call up art as it was previously cultivated than merely to "stimulate art production." The latter is, however, Professor Bosanquet's translation.

[13] *Subjective* apparently in the sense of being wholly personal to the writer or philosopher in so far as the form of his treatise deals in classification and arrangement peculiar to himself and so *external*, if not entirely arbitrary.

[14] I agree with the note of Professor Bosanquet (Trans., p. 21) that the word *element* refers here to the mental constituents of art, as contrasted with the sensuous medium.

[15] That is to say, the essential formative process involved in its necessity.

[16] There must be a misprint or oversight in Professor Bosanquet's rendering of this passage (p. 21). As the sentence now stands it does not appear to me to make sense.

[17] *Von ihm.* The pronoun, I take it, must refer here to *das Andere* rather than the subject of the verb.

[18] "Makes itself an alien to itself" perhaps expresses the German better.

[19] That is, the work of art.

[20] *Haltpunkte.* Points of arrest in essential ideas necessary which restrain this tendency to purely arbitrary caprice.

[21] I do not think the first part of this sentence ironical. Hegel admits that a general knowledge is a legitimate feature of modern culture. But he points out that people are only too ready to confuse such a general knowledge with real art scholarship. To bring out this I have translated rather freely.

[22] Detail of historical fact and artistic observation.

[23] It is historical, first, regarded as a survey of historical condition, and, secondly, because facts are collected whether in relation to ancient or modern art as a historian collects his facts.

[24] Lit., the inmost or most ideal (meaning).

[25] *Vollkommen.* Complete or rather completely articulate and rounded in itself. It is not easy to select the English word that exactly corresponds.

[26] *Bestimmte Individualität.* The definition may, as Hegel says, be more significant, but it is for all that not very clearly expressed. Professor Bosanquet translates the words "determinate individual modification."

[27] My view is that what Hegel means to say is that in caricature ugliness is emphasized and made more (*näher*) a part of the content than belongs to the true nature of the characteristic of which it is (in Hegel's opinion) no essential determinant or property. The view stated in the sentence is therefore a kind of *reductio ad absurdum.* Professor Bosanquet's translation appears to me to leave it doubtful whether the view stated is a just one or not. He translates *näher* by "closely," not the comparative. In my view Hegel agrees that caricature may be characteristic, but he does not agree that it is a genuine property of the characteristic where it is pressed to the excess of ugliness.

[28] *Bestimmung.*

[29] That is, in Hegel's view.

[30] *Das Wahre*.

[31] *Den denkenden Begriff.* It is possible that the "notion of thought" would express Hegel's meaning, as it would be a less strange expression. But I have retained the more literal translation as the reference may be to the self-evolution of Thought in its own dialectical process, thought or the Idea thinking out itself in the Hegelian sense. Professor Bosanquet seems to assume this, as he translates "the thinking Idea."

[32] *Kunstschönen.* I have translated this by the expression "fine art" because Hegel in the opening of the introduction makes the expression interchangeable with *schöne kunst.* At the same time it must be recollected that the emphasis here is even more on "beauty" than the fact that it is the beauty of human art. And it is for this reason, I presume, that Professor Bosanquet translates it here "artistic beauty." The only objection I have to make to this, apart from Hegel's words I have referred to, is that

the expression "artistic beauty" is sometimes used to signify beauty that is capable of being expressed by art. Of course that is excluded from Hegel's use of the term; he means the beauty of artistic work.

[33] *Subjektiven.*

[34] Independent, that is, of the consciousness of any particular individual. Hegel does not necessarily mean independent of consciousness altogether. He has, no doubt, generally in his mind the kind of scepticism which received its most logical exposition in Hume.

[35] This appears to me the meaning of *zufälliger Sinn.* Professor Bosanquet translates it "accidental sense." By that I presume he understands the meaning to be "a sense of beauty that is entirely personal to the recipient," it may be possessed by one man, but not by another. Hegel's illustration hardly supports this, so it seems to me.

[36] I do not know the exact translation of *lemmatisch*, and by a curious slip the sentence is omitted from Professor Bosanquet's translation. The general sense is plain enough. Every particular science accepts its subject-matter as a *datum*. It starts from the empirical fact. Whether it admits the assumption or not, it does assume such facts. It is obvious that Hegel's adoption of this standpoint is only relatively true.

[37] Hegel means, I presume, mainly in the introduction. After that he does in a qualified degree discuss the profounder import of the Idea of Fine Art. His statements are not perhaps wholly free from inconsistency, because he has previously said that apart from an encyclopaedic consideration of all the sciences, it was not possible to do so, and also some of His statements seem to imply that he does not intend to do so.

[38] That is, in the first Part of the entire treatise.

[39] What Hegel means by the *die letzte einleitende Betrachtung* I am not quite sure. I presume he means the introduction to the first Part. The whole of this paragraph is not very clear.

[40] By man's sensitive life in its widest sense is, I think, intended.

[41] The German words are *machen* and *nachmachen.* We have no exact equivalents.

[42] *Lit.*, "to fill out (*ausfüllen*) in complete equipment."

[43] *Individuelle.*

[44] The German will admit of the interpretation that the reference is merely to genius, but I think Hegel clearly means that neither one nor the other can be thus conjured up.

[45] At the end of the first main division of the work.

[46] One of Meredith's correspondents has put the question with all gravity whether he considered inspiration could be assisted by wine drinking. With equal gravity our humourist replied that though wine might be something of a restorative after mental effort it was not his experience that it contributed to first-rate artistic work. He actually mentions the case of Schiller. Though I have read somewhere that this poet used to be inspired by the smell of rotten apples I do not recollect reading that he favoured the champagne bottle. Meredith also mentions the case of Hoffmann, and adds that the type of his work does not increase our respect for the precedent.

[47] *Eine äusserliche Arbeit.* A craftsmanship which has to deal with the outside surface. We may translate "external craftsmanship"; but the translation in the text gives the meaning best, I think.

[48] *Keinen geistigen Stoff.* Professor Bosanquet translates "spiritual content." I imagine the emphasis to be mainly on the absence of positive ideas available to knowledge. In any case Hegel appears to press his point of contrast too far. Men of genius such as Mozart (who was probably in his mind) and Schubert may bear him out. But on the other hand we have a Keats, Shelley, and Raphael. Genius matures rapidly, but the greatest works of musical art no less than any other imply a real maturity of mind at least, and more than is here assumed of, I should say, a rich experience. Mozart, of course, upsets any theory, and it is questionable even whether Mozart is really an exception. It depends on the point of view from which we are estimating the intelligible content of music as an expression of soul-life.

[49] The "Iphigenie" was completed in Goethe's thirty-eighth year, fourteen years later than "Götz." The bulk of his more important works are of the same date or later. Schiller's "Wallenstein" was completed after his thirty-fifth year.

[50] This is surely not quite accurate. The medium of painting in the sense that speech or writing is the medium of poetry is not canvas or panel but oil or other colour. Canvas would correspond with the blank pages of a book.

[51] Free, that is, from accidental and irrelevant matter.

[52] Professor Bosanquet translates *sinnliche* here as "sensitive." I am inclined to think that Hegel here rather leaves out of sight the fact that in the process of Nature we have sensitive organic life no less

than unconscious inorganic. His contrast is rather between the conscious life of man and unconscious nature, the conscious life that is not self-conscious being for the object of the contrast treated as equivalent to unconscious. He would also apparently ignore the fact that man himself and the higher beauty which attaches to him is also from ope point of view a part of the natural process.

[53] That is, apart from purely personal ends in its pursuit, which are accidental to its essential notion.

[54] That is, in the medium of conscious life.

[55] *Einmal.* They are there, but they do not know they are there.

[56] *Aus geistiger Bildung, i.e.*, a high level of mental culture is necessary before the advent of civilized manners and customs in which spiritual life is reflected with real refinement and directness.

[57] *Bedürfniss zur Kunst.*

[58] *Lit.*, "In the form of the most abstract single subjectivity." That is to say, that the main fact about it is that it is felt; but, except in respect to intensity, it cannot be described as an object of thought with defining attributes, It is abstract individual sensation.

[59] By the expression *Kreis* Hegel would mean rather an indefinite sphere than a definite circle. The simile is perhaps not very apt. The idea, apparently, is of a sphere of feeling, that is, such as being self-complete, but is so abstract or indefinable that the introduction into it of positive ideas such as justice, etc., are the mere entrance of spectral forms which vanish in such an indefinable medium, without disclosing their nature. They are felt but not cognized for what they really are.

[60] *Blinder*, blind in the sense that it is not guided by deliberate and self-conscious reason, *i.e.*, mere animal instinct.

[61] A difficult sentence to translate. I have followed Professor Bosanquet in assuming that the substantive with which *mangelhaft* agrees must be borrowed from the following sentence, though it seems also to be carried on in a loose kind of way from the previous sentence (*Gesckmacksinn.*) The entire sentence is built, as we have it, on the further confusion that there are two parallels which before the sentence ends are regarded as one! That is to say, the general critical sense is contrasted with the critique of particular works of art and further the defect of that general sense in its neglect of *universal* principles is further contrasted with the way the specific critique deals with *particular* works. I hardly think, however, that my admirable predecessor is justified in ignoring the comparative degree of *bestimmteres*, or in his translation of *Zeug* as "power." I take it to mean the

material of actual works of art. The sentence is a good example of, some of the difficulties of Hegel translation.

[62] *Die Sache.* The subject-matter in its most real sense as "content."

[63] That is, the so-called "good taste."

[64] *Begriff.* Concrete notional Idea.

[65] That is, in his physical form.

[66] Hegel is here considering desire abstractedly, that is, on its own account (*als solche.*) It may of course in its turn subserve a rational purpose, such as the preservation of health or life. But the contrast here is between the relation of appetite, and that of the theoretic faculty to objects.

[67] *Sein Objekt.* The object in which he finds himself; rather this, I think, than that which he has created.

[68] *Innerlich*, *i.e.*, in the world of mind as contrasted with that of the sensuous *vorhandene.*

[69] Hegel or his editors have "in a converse way." This is obviously a mistake. In both examples the point is that the object is *preserved* as against *desire* with its destruction, and the *contemplative intelligence* with its ideal transformation.

[70] *Ein ideelles.* The meaning is, I think, that the *materia* is stamped with the hall-mark of deliberate artistic purpose. The ideality, though relatively jejune on such a work as the pyramids, in the higher reaches of art such as poetry and music affects of course the medium itself, the musical chord being pure ideality. Professor Bosanquet's translation omits this and the previous sentence, probably by an oversight. But it is also possible that this thinker conceived the statement *as here expressed* to be misleading, or at least open to misconception. In architecture and even painting it is obvious, from a certain point of view, the sensuous *materia*, if directed to an artistic end, remains none the less the material borrowed from natural fact though the fact as natural may be modified in its form. Painting may *represent* the semblance, but it employs a medium simply sensuous. Hegel has mainly before his attention here obviously the arts of painting, poetry, and music.

[71] They are *theoretical* because as applied to a work of art they imply the presence of the contemplative faculty. In a later section of the work Hegel makes a more complete analysis of what is implied in the sense of hearing as applied to musical composition and in the colour sense. In both

cases it is obvious the mind contributes to the facts cognized. Hearing is, however, from Hegel's point of view the most *ideal* of the two, and he conceives the position of the ears itself points to this distinction.

[72] It may at least be questioned whether the ground given here of this distinction, or part of it, is strictly accurate. It may be said that our sense of sight and hearing are both in contact with the waves of the medium, the vibration of which produces the impression we call sound or light. The most obvious distinction then appears to be that the natural object is left as it is by hearing and sight. This at least holds good as against taste. But at least it may be questioned, I think, whether the sense of touch may not be the source of artistic enjoyment, certainly in the case of the blind. And the sense of smell at least leaves objects as they are, and some may contend that it is a source of enjoyment of the beauty of Nature. Hegel would reply, of course, that no works of human art are enjoyed by such means. The main ground is, however, that sight and hearing are the senses closest to intelligence.

[73] By *Anschauungen* Hegel apparently has in mind all the ideas of poetry. We should certainly rather have expected the word *Vorstellungen*, the word used being rather "visible perceptions." But the three words here seem generally to denote the subject-matter of painting, music, and poetry.

[74] Lit., "Operative in the artist viewed (*i.e.*, the artist) as the personal energy (*Subjektivität*) which creates." Professor Bosanquet's translation "as a productive state of the person" would appear to make "the sensuous side" a subjective state of the artist. But apart from construction, can we speak of this as a "state"? It is modified by his energy — but it can hardly be regarded as a part of it.

[75] I find it impossible to fix any one English equivalent to Hegel's use of the words *Einbildungskraft*, *Phantasie*, or *Vorstellung*, in the sense at least that fancy, imagination, or phantasy have been used and defined by famous English writers. Generally speaking, I should say that *Phantasie*, or as it is called sometimes "artistic" or "creative" *Phantasie*, stands for the most intellectual faculty, though *Vorstellung* is also used in much the same sense. But it is impossible to arrive at any clear distinction such as was originally made so profoundly by Ruskin between fancy, the instrument of poetical talent, the surface gift, and imagination or, as he called it, *penetrative* imagination, which summarizes all the powers of a genius and personality and enters into the heart of the subject-matter by an illuminating flash which *reveals* reality rather than illustrates by means of image. The present passage appears to me even more unsatisfactory than the more carefully digested analysis at the end of Part I, when Hegel discusses the artist. It not merely ignores the indispensable presence of imagination in the pioneers of science, but appears to myself to confuse talent as the natural gift of a man with the mode in which it is exercised in presenting ideas in sensuous imagery, or at least makes the former depend on the latter. Professor Bosanquet translates *Phantasie* here by "fancy." But "fancy" is, in our way of looking at it, precisely not the faculty which *distinctively* belongs to "the great mind and the

big heart or soul," though other parts of the description are more applicable. And in short, as I say, to fix definite English equivalents to Hegel's phraseology appears to me impossible.

[76] *Die Phantasie*.

[77] This is, I presume, Hegel's way of putting the simple fact, that much of the process of artistic production is unconscious. One man instinctively draws, or picks up his notes on the piano, another cannot. I think Hegel rather refers to this *original* talent than the much more important one in which genius, right into maturity, rides over difficulties without knowing how it does so. Such happy or even miraculous effects — such as artists sometimes playfully call them — are obviously in part, if only in part, the result of profound artistic experience. He is dealing almost exclusively with the natural bias, which makes one man naturally an artist, whether creative or executant, and is absent from another. He hardly approaches the question what constitutes the artist of genius as contrasted with the man of natural talent.

[78] This confirms the conclusion above.

[79] *Für sich.* If merely admired as imitation and nothing more.

[80] *Zur Ekelhaftigkeit.* "Sickeningly like" is Professor Bosanquet's closer translation. The expression "damnably like" is not unknown.

[81] I think with Professor Bosanquet that *phantastischen* is here not "fantastic" but strictly derived from *Phantasie* in its sense of imagination. "Completely," of course, as involving no direct imitation of Nature.

[82] Formal, *i.e.*, implying no creative supplement from the artist, purely mechanical.

[83] It would be both instructive and interesting to discuss if, and how far, and by virtue of what, that distinct type of modern art known as "still life," such as a few objects of the library, or even a shell or two and so on up to more important organic life was excluded from this condemnation. It is quite clear that Ruskin would have a good deal to say that would imply important qualification.

[84] *Begeisterung.* I think this must be the meaning. Inspiration hardly makes sense. It is art that is inspired, not those who attend the celebration.

[85] *Im Innersten* is I think here obviously to be taken with the verb, not with the substantives.

[86] *Ueberhaupt.*

[87] The meaning of *in diesem Gebiete* is, I presume, the actual world. But if so it is simply otiose, and I have left it out.

[88] *Bestimmung.* The translation given appears to be the sense, though we should rather say weaken a *man* from the pursuit of a definite course. Professor Bosanquet, who translates the word "aim" a little lower down, evades the word here.

[89] *Raisonnirende* here and *raissonnement* below have a depreciatory sense — and signify ordinary reasoning in the first instance and the methods of the popular secularist in the second.

[90] A sentence omitted by Professor Bosanquet, and it seems to amount to little more than a more generalized statement of what has gone before. The end of art both directly and indirectly concerns its subject-matter, or rather, as Hegel puts it, the need of the notion or Idea of it carries us to a further end beyond the end shared in common by its particular content.

[91] I follow Professor Bosanquet in his translation of the words *als Allgemeines für sich zu zuerden*; but I am not sure that the more literal translation is not simply as the words stand, the sense being not to be self-conscious of himself (*für sich*) as the universal principle, to be aware of this property, but rather as universal principle to become *for* himself, *i.e.* "independent of desire."

[92] *Einheit* — unity to the point of fusion, identity.

[93] *Unmittelbaren Befangenheit.* "Sunkenness" is Professor Bosanquet's translation.

[94] *Theoretic* as a direct transcript of *θεώρια, θεωρειν.*

[95] *Gesichtspunkte.* The various points of view necessary to arrive at such a general conclusion.

[96] Though not entirely confident I am right in accepting the words *zu bringen* as a repetition of the *hervorzubringen* just before, the alternative of Professor Bosanquet which takes the words *wird zu bringen seyn* as equivalent to *gebracht seyn sollte* certainly appears to me no direct translation.

[97] "Poets aim at utility and entertainment alike."

[98] I think that Hegel in his use of *erste* here rather refers to the fact of past history than a fact in the individual history of nations. "Art is, in the early days of history, the instructress of nations," gives, I

think, his meaning. It is the first instructress in the history of nations.

[99] I venture to think if Professor Bosanquet's translation were the right one the German would be *ein in sich selbst gebrochenes.* I do not think *in ihm selbst* can be a German rendering of "in itself." But I admit the translation is tempting whether Hegel had in his mind the "house divided against itself" or not.

[100] Lit., "the spiritual universal," *i.e.*, the universal substance of its ideal content.

[101] Precisely as Ruskin, for example, in his "Modern Painters" condemns both Titian and Tintoret, not because they painted the *Paradise* or the *Assunta*, to produce fine paintings, or even because they did not or did themselves believe in the truth of their subject-matter, but because they did not paint *in order to make converts*, an extraordinary lapse of judgment.

[102] *Im besten Sinne des Wortes.*

[103] Professor Bosanquet points out in a note on this passage (p. 101) that *Sittlichkeit* here, which he translates, as I have done, "respectability," is the *habit* of virtue, without the reflective aspiration after goodness as an ideal. Of course there is no depreciation in the use of the term. It is simply the morality of ordinary people, who do generally what their neighbours think the right thing. The word *moralität* and *moralisch*, which I have only been able to translate by a paraphrase, is the morality of the standpoint discussed, which is very much that of Kant or "Duty for duty's sake" in Bradley's "Ethical Studies."

[104] That is the contingency of the world of Nature as contrasted with the essential stability of mind or spirit.

[105] Lit., "To satisfy itself in its *real* or independent self (*für sich*)." It cannot identify itself with either side as its wholly real self made therein explicit. It is neither fish nor fowl.

[106] *Bestimmüngen* may here be a reference to man's broadest spiritual characterizations as one of the human family, the race, the nation, and so forth, or, as I think, a reference to his vocation, future destiny, general welfare.

[107] *An und für sich Wahre.*

[108] *Unbefangenen*, *i.e.*, the naïve outlook of ordinary life.

[109] Professor Bosanquet merely translates *are not* and *are* in italic as in the text, which of course, except that he adds a comma after *are*, is a literal translation. But the sense, as I understand it, is that the writer says it is not in the sense that these two contradictories do not exist *at all* (*i.e.*, as relative reality), but rather in the sense that in *philosophical thought* which grasps their essence they are not only present but present as reconciled factors of one truth. Professor Bosanquet's translation appears to me to amount to this: that all Hegel maintains is that the sense he means is not that such contradictory elements are *not* reconciled, but in the sense that they *are* reconciled. Perhaps this is his view. But if so, I fail to see the importance of the antithesis, which appears to me between *gar nicht sind* and *in Versöhnung sind.* Hegel before had expressly said that such contradictory sides were reconciled in philosophy, so I do not see why he should so emphatically repeat himself. The comma, of course, may be a misprint.

[110] *Begriff.* Notion, or concrete Idea of it.

[111] Of that world in its opposition to reason.

[112] *Der Mensch als er geht und steht.* The man in ordinary conditions — the *average* man, however, rather than the *natural* man, which carries slightly different associations.

[113] The difference between a material instrument, which is a mere means to an end conceived by the craftsman, such as a plough for ploughing, a rake for raking, and a purpose inseparable from the organic whole as a mouth for eating, for without life the organism collapses.

[114] *Für sich.*

[115] In his history of Aesthetic in Germany Lötze disputes this. It seems to some extent a question of definition. In Hegel's view a dead body is not a human body in the full sense, but the *corpse* of a man. A hand separated from the body, whether we call it a hand or not, is no longer, whatever it may be, a living member, its essential significance as a hand has disappeared. It was only a hand in its coherence as part of a larger whole. It may still for a time preserve the semblance of its life, but it is cut off as the withered leaf. These are facts at least that are undeniable, and the objection appears to me based on a misunderstanding. A hand is only *an und für sich* human when it is part of a living man. What is the organic reality in the complete sense is the man as a *whole.* The hand is merely the extremity of one of his arms. You may call a dead hand a hand if you like. The point is what was implied in the fact that you called it a hand at all whether alive or dead.

[116] That is, by Kant, of course.

[117] By *Verwicklung* I understand the general evolution of ideal philosophy which the defects of the Kantian Critique stimulated. Professor Bosanquet apparently limits it to a perplexity personal to Schiller. I doubt whether the word will bear this.

[118] That is, the concrete idea of humanity as a collective aggregate.

[119] That is, intelligence as asserted by a society of human beings as public opinion, etc.

[120] *Die Ineinsbildung.*

[121] "Grace and Dignity."

[122] *Gesinnungen.* "Sentimental views" is probably what is implied.

[123] *Alle Sache.*

[124] Professor Bosanquet is clearly right in his view that the order of the words here should be reversed. The words *an und für sich* are obviously the wider explication of *in sick selbst*, the auxiliary, as not unfrequently in Hegel, being almost equivalent to *nämlich.* Whether a misprint or an oversight I have translated subject to this correction.

[125] I presume the revelation is not merely that of visible shape or even mainly.

[126] *Das alles aus sich setzende und auflösende Ich.* The three points emphasized by Hegel in Fichte's "Philosophy" are: (*a*) The Ego is abstract; (*b*) Everything is a *show* for it; (*c*) Its own acts are a semblance.

[127] Hegel uses the word *Eitelkeit* and *eitle* in their double sense of empty-nothingness — futility and vain or conceited. This cannot be readily reproduced in English.

[128] *Schönseligkeit.* Borrowed no doubt from Goethe's notion of a "fair soul."

[129] Like the "vaulting ambition" of Shakespeare which falls on the other side, is *über sich selbst.*

[130] *Haltung.* Professor Bosanquet translates this "conduct." I rather think it refers to "bearing, demeanour." They are, as we say, "featureless, flaccid figures."

[131] *Läppische.* I am not quite sure what is exactly meant. Professor Bosanquet translates it "grotesque." But the word is a provincial form of *Schlaff* apparently — loose, flaccid and so childish, trifling.

[132] *Moment.* A phase in an evolutionary, or, as it is here, a dialectical process. A momentary feature of it.

[133] This final section is called the Division of the Subject.

[134] *Subjektivität.* That is, the ideality of consciousness, or thought.

[135] Professor Bosanquet, in his note on this passage, expresses the opinion that Hegel when he writes thus is referring "To the self-consciousness of individual human beings as constituting, and reflecting on, an ideal unity between them." This no doubt, as he suggests, does put a somewhat unnatural meaning on the word "person" or "subjekt." No doubt there is a sense in which we can ascribe personality to a state, or nation, in the concrete unity of its life. But while admitting that unity such as this, which is not sensuous but ideal, can be "effective and actual," I find it difficult to conclude that Hegel did himself hold that the unity of the Divine Being was *merely* identical with the unity or totality of concrete human life as reflected upon by single individuals. How far is human life as a whole on this Earth a unity or totality at all? That question has been discussed by Professor Bradley and others with very different conclusions. Nay, how far does human existence itself exhaust the actually present realization or self-realization of self-conscious Spirit or Intelligence? Whatever maybe the wisest answer to such and other questions I can hardly think that Hegel would have accepted Professor Bosanquet's interpretation as completely adequate.

[136] *Fackeldistel*. "Torch thistle," a plant of the genus Cereus.

[137] Or, "as mind and in mind."

[138] That is to say, presents to itself to conscious grasp of itself as such Art-spirit (*als künstlerischer.*)

[139] The two evolutions here alluded to are (i) that of a particular way of regarding Nature, man, and God in a particular age and nation such as the Egyptian, Greek, and Christian viewed in express relation to art; (ii) The several arts — sculpture, music, poetry, etc., each on their own foundation and viewed relatively to the former evolution.

[140] The point, of course, is that the different media of the several arts are inherently, and in virtue of the fact that we have not here *mere* matter as opposed to that which is intellectual rather than

sensuous, but matter in which the notional concept is already essentially present or pregnant (sound is, for instance, more ideal than the spatial matter of architecture), adapted to the particular arts in which they serve as the medium of expression.

[141] Professor Bosanquet explains these “plastic forms” (*Gestaltungs formen*) as the various modifications of the subject-matter of art (Trans., p. 140 note). I am not quite sure of the meaning here intended. It would apparently identify the term with the *Gebilde* referred to in the third division. I should myself rather incline to think that Hegel had mainly in his mind the specific general types, that is, the three relations of the Idea itself to its external configuration, viewed as a historical evolution, which Hegel calls symbolic, classical, and romantic. Perhaps this is what Professor Bosanquet means. But in that case it does not appear to me so much the subject-matter as the generic forms in the shaping of that matter.

[142] *Das wahrhaft Innere.* That is, the inward of the truth of conscious life.

[143] Means apparently the notion in its absolute sense.

[144] Because it represents spirit as independent of an appropriate bodily form.

[145] What appears to be denoted by *Geistigkeit* is the generic term of intelligence — that activity of conscious life which does not necessarily make us think of a single individual — the common nature of all spirit.

[146] By *Innerlichkeit*, which might also be rendered as pure ideality, what is signified is that in a mental state there are no parts outside of each other.

[147] *Subjekt*, *i.e.*, the individual Ego of self-consciousness.

[148] *Das subjective Innere,* lit., the subjective inner state.

[149] *Geistigkeit.* Professor Bosanquet translates it here “intellectual being.”

[150] The distinction between a percipient and an external object falls away. The content displayed is part of the soul-life itself.

[151] Professor Bosanquet apparently assumes a negative has slipped out. But the text probably is correct in the rather awkward form in which it stands.

[152] Thus poetry is primarily a romantic art, but in the Epic it is affiliated with the objective character of classical art, or we may say that there is a romantic and classical type of architecture, though the art is primarily symbolic.

[153] *Gestalt.* Plastic power is perhaps a better translation.

[154] He means that in architecture the building is merely a shrine or environment of the image of the god.

[155] Infinite, of course, in the concrete sense of rounded in itself, as the circle, or, still more, the living organism.

[156] Lit., "which is not also that of the spiritual sphere."

[157] That is, an object limited only in space.

[158] *Subjektivität.* The particularization in romantic art implies the presence of an ideal element imported by the soul of the artist, which appeals directly to the soul in its emotional life. Compare a picture by an Italian master with a Greek statue.

[159] Lit., "A multiplicity of isolated examples of inwardness."

[160] That is, in the life shared by all as one community actuated by a common purpose.

[161] As in sculpture.

[162] Professor Bosanquet's note is here (Trans., p. 166) "Posited or laid down to be ideal. This almost is equal to made *to be* in the sense of *not being.* In other words musical sound is "ideal" as existing, *quâ* work of art, in memory only, the moment in which it is actually heard being fugitive. A picture is equally so in respect of the third dimension, which has to be read into it. Poetry is almost wholly ideal, uses hardly any sensuous element, and appeals almost wholly to what exists in the *mind.*"

[163] By particularization is meant the variety in the material of colours, musical tones, and ideas, which latter are really quite as much the medium of poetry as written language. The *sensuous* medium is here an abstract sign and, as Hegel would contend, nothing more than this.

[164] Reference, of course, to Hegel's unfortunate acceptance of Goethe's theory of colour.

[165] The colour of art is not merely ideal as applied to only two dimensions of space, but also is "subjective" in the artistic treatment of it under a definite "scheme." It is not clear whether Hegel alludes also to this; apparently not, though it is the most important feature. In fact, even assuming his theory of light to be correct, it is difficult entirely to follow his distinction between the appearance of colour on a flat or a round surface. As *natural* colour the one would be as ideal as the other. Only regarded as a composition would painting present distinction.

[166] It is obvious that the reference here is mainly to an intentional appeal to the human soul through the content of the composition. But the appeal may also be made through the technique and artistic treatment of the medium itself.

[167] The parts of a chord are not in space, but are ideally cognized. Hegel describes this by saying that music idealizes space and concentrates it to a point. It would perhaps be more intelligible to say that it transmutes the positive effects of a material substance in motion into the positive and more ideal condition of time. The point which is continually negated is at least *quâ* music the point, or rather, moment, of a temporal process.

[168] By the indifferent externality of space is signified the fact that the parts of space, though external to each other, are not qualitatively distinguishable.

[169] Succession in time is "more ideal" than coexistence in space because it exists only as continuity in a conscious subject.

[170] Painting no doubt introduces ideal elements into the artistic composition of colour, but the colour still remains the appearance of a material thing or superficies.

[171] That is to say, music or harmony is based on a solid conformity to law on the part of its tones in their conjunction and succession, their structure and resolution.

[172] As in painting.

[173] The views here propounded suggest considerable criticism. It appears to me that the stress here laid upon the intelligible content of poetry as contrasted with the sensuous qualities of its form as modulated speech is certainly untenable. What we call the music of verse may unquestionably be most intimately associated with the ideal content expressed; but apart from the artistic collocation of language as sound no less than symbol we certainly do not get the art of poetry. Even where Hegel deals directly with rhythm and rhyme in the body of the treatise I think it is clear he underrates all that is implied in the difference between the musical expression of poetry as contrasted even with the

sonorous language of mere prose. A further question upon which more doubt is permissible is how far the actual script in written or printed letters is not entitled to be regarded as at least in part the sensuous medium. No doubt the poem is not dependent upon it as a painting is upon colour, or the canvas which supports it, for it may be recited. But at least it is practically dependent upon it for its preservation. The point may very possibly appear, however, as nugatory or entirely unimportant, beside the question whether the medium of the art is not really imaginative idea rather than articulate speech.

[174] *Absolute Formen.* Adequate in the sense of being unconditionally so.

FIRST PART

THE IDEA OF FINE ART, OR THE IDEAL

I. THE POSITION OF ART RELATIVELY TO FINITE REALITY, RELIGION, AND PHILOSOPHY

The conclusion of the introduction brings within sight the more methodical exposition of our subject. It will in the first place be useful as a point of departure for a true philosophy of the beautiful to sum up shortly the position of Fine Art in its general relation to the Real, no less than to emphasize the salient features which distinguish the philosophy of Fine Art from other philosophical inquiries.

(*a*) With this object in view we will first enumerate the diverse attempts which have been made to apprehend the beautiful in thought, placing each in the order which will best assist a critical verdict. We have already contributed something to this in our introduction. And, moreover, we may add that the mere inquiry what others have contributed either rightly or wrongly to our subject, at least with the hope of ascertaining something really instructive to an exposition which claims to be wholly scientific, will not assist us much. So far from this being so we must preface our remarks with the admission that, in the opinion of many, the beautiful, for the very reason that it is the beautiful, does not admit of such intellectual apprehension, is, in short, no object intelligible to human thought. To such a thesis we must for the present — in our response to those who at this time of day contend that all Truth is ultimately incomprehensible, and only the finiteness of the phenomenal and the contingent matters of temporal existence is within our mental grasp — reply that it is precisely Truth, and

Truth alone, which is to be thus *comprehended*, and for this reason that it possesses the absolute *notion*, or, more succinctly, the Idea for its basic support. Now beauty is no other than a particular determination under which the True is expressed and revealed to us; and it lies open to the fullest comprehension of thought in so far as such can equip it with the armoury of the concrete notion. It is quite true that no idea has suffered more severely in our own time from misconceptions than this which we call the notion in its fullest explication. One is only too often misunderstood to mean a determination which is abstract and one sided, or at least a conception of the analytical understanding. As thus understood neither the totality of Truth nor the idea of beauty as a concrete whole can be brought home to a thinking consciousness. But the idea of beauty, as we have already observed, and shall seek to make more intelligible as we proceed, is no such abstraction of the mind: rather it may be defined as the absolute notion in its self-evolved concreteness, or still more specifically defined, the absolute Idea.

(*b*) And, further, we cannot more succinctly define the *absolute Idea*, in the above use of the expression, than by saying it is mind (Spirit): and we may add that the mind thus referred to is not mind regarded as finite, that is, subject to the conditions and limitations of sense-perception, but the universal and *absolute* Intelligence[175], which, out of its own free activity, determines Truth in the profoundest signification of the term. To the ordinary consciousness of everyday life the object of perception, no doubt, breaks away from mind, as though our thought stood in opposition to Nature, which receives from us a validity equal at least to the consciousness which perceives it. But in this way of looking at Nature and the conscious subject as two neighbours set over against one another in territories equally self-subsistent it is only the finite and limited mind, not that which it is as an infinite substance and in its notional truth, which is apprehended. Nature

is not thus to be set over against absolute Mind, either as conjoint with a sphere of the Real of equal worth, or as an independent boundary thereto. Rather the aspect which Nature appears to hold in this respect is that which mind or spirit itself sets up, and of which it becomes the product as a Nature in which limit and boundary are themselves determining constituents. In fact, Mind in its absolute or infinite substance can only be apprehended as this free activity, which is manifested in self-development through differentiation. This object, this *other*, through which such differentiation proceeds, is regarded in such opposition as Nature, but as the object of intelligence it is quite as much indebted to Mind for the free gift and fulness of its own essential substance. We must therefore conceive Nature as herself containing in potency the absolute Idea. She is that Idea in *apparent shape*, which mind, in its synthetic power, posits as the object opposed to itself. She is so far a product, a creation. The truth of Nature therefore is simply the determination by mind of its own substance, its ideality and power of determination, through a process which no doubt begins with a separation of itself into two factors which apparently negate each other, but which, by the very activity of such negation and separation, passes beyond the contradiction it implies to a unity which heals the fracture. Instead of finding our-elves opposed to a limit and a barrier we have a totality in which the parts which opposed each other are fused together by the free universality of mind. This ideality, in other words this infinite power of determination[176], is that which constitutes the profound notion of Mind's *subjectivity.* As subjectivity mind is, in the first instance, merely Nature, Mind, or Spirit that is *not explicitly* unfolded, mind which has not arrived at the grasp of its true notion. Nature is here set up in opposition to Mind, not as an object which itself has created, but as one whose limits it fails to overcome, an object, moreover, which, as assumed to be already subsisting in independence, Mind remains alongside of in the internal seclusion of

knowledge and volition, and is only able to constitute the other side of Nature. The finiteness of scientific theory, no less than that of practical life, is to be, found in this limited mode of consciousness, where intelligence is restricted to the use of finite categories and the formal "ought" in the realization of ethical perfection[177]. We find here, as we have pointed out was the case with Nature, that the phenomenal is not adequate to the essential truth of that which appears; what we receive is still the confusing medley of abilities, passions, intentions, opinions, and talents, which no sooner make themselves felt than they are displaced, working at cross purposes as often against as on the side of each other, in a strife between volition, opinion, and reflection, which brings to the surface every phase of fortuitous experience in all its confusing variety. It is the standpoint of the entirely finite, temporal, contradictory, and for that reason transitory, unsatisfied, and unreconciled spirit. For the satisfactions which obtain in such a consciousness, through the finiteness which inseparably clings to its entire outlook, itself so limited and confused, are of a purely relative and isolated validity. It is inevitable that consciousness, volition, and thought should make an effort to rise above this condition and seek for the universality, unity, and satisfaction which it eventually finds in the infinite substance of Spirit and its Truth. This unity and satisfaction, to which mind is carried forward by the impulse of its own ideal activity, transmuting the raw material of its finite conditions, constitutes the first revelation of that which the world of appearances is under a more notional grasp of it. Mind grasps its finiteness as the negation of its own essential substance, and is aware of its infinity. And this essential truth of the finite mind is the absolute Mind or Spirit. In this form of self-consciousness mind is merely actualized as absolute negativity. The element of finitude which it confronts is apprehended as such and annulled. In this, the highest sphere of its activity, mind becomes the object of volition. The Absolute itself becomes the *object*

of mind. Spirit, as self-consciousness, differentiates itself as the *knowing subject* from the absolute Spirit as the *object* of knowledge. Mind in this latter sense, in contradistinction from mind which has not overcome the conditions of finite perception, may therefore be defined as a finite mind in possession of the principle of differentiation from its true object. In the higher and more speculative consideration of truth, however, it is the *absolute mind itself*, which, in order to unfold explicitly the knowledge of itself, essentially becomes a principle of differentiation to itself, and thereby posits the finitude of mind, within which it becomes for itself absolute object of the knowledge of itself. It is now absolute mind within the ideal community[178] which belongs to it, the actual Absolute of itself in the form of Mind and knowledge[179].

This is, in fact, the starting-point of the Philosophy of Fine Art. For the idea of Fine Art is neither the *logical Idea*, absolute Thought, that is, which develops itself in the medium of its freest activity, nor is it the Idea of *Nature* apprehended under more finite categories. Its province is rather that of Mind untrammelled by either the judgments or the actions of the *finite* spirit.

(*c*) The realm of Fine Art is the realm of *absolute Spirit.* We can but briefly indicate the reason why this is so. A fully philosophical proof belongs rather to treatises which immediately deal with those questions of philosophy we have noticed already, by which we mean those which treat of Logic, whose content, as above explained, is that of the absolute Idea, or the philosophy of Nature, or lastly, the philosophy of Mind in its determinate spheres of finitude. For in these sciences the object is to show not merely how the logical Idea presupposes the objective particularity of Nature as a vehicle to its determinate existence, but also how it is capable of passing from such externality to mind, and, finally, of freeing itself from all the

finitude that clings to it and of attaining to Spirit in its eternal concreteness and truth.

From such a point of view, which is also applicable to art when regarded in all the fulness of worth it in truth implies, we are justified in associating it with the self-same province which belongs to religion and speculative philosophy. In every direction in which Mind or Spirit becomes identical with the absolute Mind it frees itself from the restricting limits of its positive existence, and, while liberating itself from the contingent relations, which pertain to it in its temporal existence, and the finite content of its objects and interests, is made aware of and discloses the entire wealth of reality it contains.

It may be of service here to expand more completely the position which Art thus occupies in its relation respectively to the life of Nature and Spirit.

A survey of the entire field of human existence presents to the ordinary consciousness of mankind the widest variety of interests and means of satisfaction. There is, in the first instance, the complex system of purely physical necessities, to the satisfaction of which the whole economy of industrial enterprise, through all its complicated tissue of commerce, merchandize, and technical crafts, is actively pursued. If we raise the level of our review to a more spiritual range, we are confronted with the world where rights are established and enforced, the world of legislative enactment, family life, division of social classes, in a word, the concrete living organism of the State. And more than this, there is the religious want, which asserts itself in the hearts of particular men and women, and finds its satisfaction in the life of a church. Finally, there is the many-sided and intricately specialized activity of scientific research, the organized effort to integrate all knowledge, and the comprehension which that knowledge implies, in one all-embracing system. Within this latter are comprised the activities of the fine arts, the interest, that is to say, in beauty, and which

derives its spiritual nutriment in the realization of that beauty in plastic shapes.

(*d*) The question becomes inevitable how far a spiritual want of this kind is bound up as a necessary element in the life of man and his world-history. In the first instance these two spheres[180] appear simply as immediate factors of our entire survey. It is, however, the requirement of philosophy to probe more deeply into that which binds them as essential and necessarily interacting constituents of one organic whole. For on closer inspection it will be found that they do not stand in relation to one another on the mere basis of utility; rather we shall discover that only through the one we shall fully comprehend the other. In other words, the one circle overlaps the other, in the sense that the higher forms of its activity are found to be a part of the other; and that which is of less value in its own province is lifted into a finer atmosphere; and what had failed to free itself from its original bounds is now enlarged to liberty through the profounder satisfaction it receives in the widening of the range of its interests[181]. And it is this which makes clear the necessity of the ideal bond.

We will recall now for a moment the analysis we established of the notion of the beautiful and that of art generally. Two opposed aspects come under notice. In the first place we have a content, an end, a significance; and in addition to that we get the artistic expression of the same, the appearance and realization of such content; and, thirdly, these two aspects of the artistic product so pass into each other that the rationality or particularity is nothing short of the expression of the artistic purpose, nothing more or less is given us than the essential expression of the entire content. What we designate as content, "significance," is just this simplicity of idea, the work of art resolved into its simplest yet most comprehensive determinants, as it exists for mind in contrast with the actual work executed. As an example we may summarize the content of a book from a few words

or sentences the book contains, and nothing may be necessary to expound the content of that book sufficiently in its general import. This simple idea, the thesis or main problem of our book, which forms the fundamental basis on which the entire structure is built, is the abstract significance. It is only the detailed exposition which gives us the concrete totality.

Both sides, however, of this opposition do not stand in an indifferent or purely external relation one to the other, as, for instance, is the case when we contrast with it the particular content of an abstract mathematical figure, such as a triangle or an ellipse, to which the external particularity of its size or figure is related without affecting its significance. Rather in the former case we shall find that the content of its form, taken in abstraction in itself, possesses a determinate impulse in the direction of realization and thereby concreteness. There is in it essentially the "*should*" of purpose. However strongly form is here posited in independence, we are unable to rest satisfied with such abstraction, and ask for something more. This is at first apprehended merely as an unsatisfied want, a desire in the conscious subject, which strives to annul itself and secure satisfaction. From such a standpoint all we can say is that the content is purely self-contained, or *subjective*, over against which the objective other-than-itself is placed in opposition in such a way as to emphasize the desire to make the subjective content *objective.* Such a conflict between the subjective content and the objective, reality which confronts it, no less than the mere impulse to transcend the opposition, is a universal characteristic of the determination of all self-conscious life[182]. Even that aspect of human life which we call physical, and still more that world of man's spiritual aims and interests depends on this necessity to carry forward that which is at first purely subjective and ideal into the objective world, that a fuller satisfaction in its essential substance may be realized. But so long as the content of aims and interests is merely and at first apprehended in the one-sided form of

subjective consciousness, and that one-sidedness is apprehended as a mere limit, this loss makes itself simply felt as unrest or pain. It is a negative something which is bound to resolve itself as such negativity, and, in order to remove the sense of defect, exerts an impulse to transcend the barrier itself, already an object of consciousness and thought. And, moreover, this transcendency does not merely amount to this, that the objective "other" ceases to be an opposed factor to the general subjective consciousness: rather in the more determinate connection, this defect of *subjective* thought is itself and *within* itself a defect and *negation* which involves an impulse to negate and pass beyond. In other words the conscious subject is implicitly and according to its essential notion the *complete whole*[183], that is, not merely what is inward, but the realization no less of that which is inward or ideal in and through what is without. If we assume that it exists only abstractly in one form we have to face the contradiction that whereas it is, according to its concrete notion the whole, yet according to its mode of existence it remains merely one side of that totality. It is only through the entire resolution of such a contradiction that life becomes affirmative. To pass through each phase of this opposition, contradiction and its final abrogation is the higher and legitimate demand of conscious life. That which remains always affirmative, is, and remains, without life. Life is built upon negation and pain. It is only by crushing out such contradictions in the crucible of fuller life and knowledge that it remains in its affirmative substance. If it anchor wholly on contradiction without such a possibility of resolution it must be infallibly wrecked thereon.

Such, then, is the nature of these determinations of thought regarded in their abstraction to which it was necessary to draw attention at the present stage.

The most exalted content which lies within the grasp of self-conscious life may be concisely called *freedom.* Freedom is the highest determination

of Spirit. In its formal aspect freedom, in its first instance, consists in this, that the subject thereof ceases to find a limit or barrier in the material which is set over against it; this is no longer an element foreign to it, but one in which it finds itself again. Even under this formal definition of it all necessity and misfortune disappears; the individual consciousness is reconciled with the world, finds satisfaction in such reconciliation, and all opposition and contradiction is thereby dissolved.

But over and above this, on closer inspection, we find that it is universally the rational — that is to say ethical relations in practical life, truth in thought — which constitutes the content of freedom. But, furthermore, inasmuch as freedom itself is in the first instance only subjective, not wholly carried into effect, there must remain for the individual an element of unfreedom, a somewhat purely objective opposed to it as a necessity of Nature; and it is accompanied likewise with the demand to secure a reconciliation of this opposition. From the reverse point of view a similar contradiction is apparent in the internal domain of the subjective consciousness itself. We have, on the one hand, that which is universal and self-subsistent in its own right, in other words the universal dictates or principles of justice, goodness, and truth. On the other there are the various impulses of mankind, all the emotions, preferences, and passions which exercise their power over the heart of each man and woman individually. This opposition no less than the other excites conflict and contradiction, and in this strife man becomes subject to every conceivable longing, the profoundest grief, and, in a word, to every kind of worry and discontent. It is the prerogative of the spiritual life of mankind to be a veil severed and broken asunder, tossed as it must be on the waves of contradiction. The animal creation lives at peace with itself and its environment. Man is unable to find a complete refuge in that which is exclusively inward, the soul as such, pure thought, in the world of legal

obligation and its *universality.* He is dependent also upon his sensuous existence, his emotions, and all that appeals to his heart and soul. It is the part of philosophy to give expression to this contradiction in thought, as it extends throughout its all-embracing compass, and to overcome the same with a reconciliation equally comprehensive.

In the immediacy of everyday life, however, man seeks to secure an *immediate* satisfaction. Perhaps the most obvious example of such a resolution is to be found in the domain of animal wants and their satisfaction.

The states of hunger, thirst, fatigue on the one hand, and feeding, drinking, sleep on the other, with all such similar states, illustrate the contradictions and resolutions to which we here refer.

In this sphere of human existence, which is fundamentally the same as purely animal life, the content of such satisfaction is, however, of a finite and limited range. Such satiety carries with it no permanence, but moves forward without rest to a renewed sense of want. Men eat, drink, and sleep, and on the morrow are as hungry and weary as before. Man is compelled, therefore, to strive for a freedom more lasting in that element of the spiritual life which he appropriates in knowledge and volition, the sciences and his social activities. The ignorant man is unfree because he faces a world which is foreign to himself, a world which tosses hither and thither aimlessly, to which he is joined as an appendage, unable to unite that foreign world to itself, and to feel itself at home there as in its own demesne. The merest impulse of curiosity, the awakening of the love of knowledge, the lowest phase of animate unrest, and the highest grasp of philosophical insight are ultimately derived from the same source, namely, the desire to overcome every condition that is unfavourable to freedom, and to bring the world of everyday life, and that of the subject which reflects upon it, into one harmonious unity. If we consider the world of *action* the result is the same;

freedom in human action is the attempt to make positive or real the reason of the Will. Reason is realized by voluntary action through the life of the State. In a State that is differentiated through itself on any rational principle, all the laws and social institutions which belong to it are simply a realization of freedom according to their own essential determinants. This being so, the reason that belongs to any citizen discovers in such institutions its own essential life: and, so long as such is not in revolt from those laws, proceeds with them as with its own kith and kin rather than a foreign adversary. We not infrequently find licence identified with freedom. But the freedom of licence is irrational; it depends upon a choice and self-determination which has nothing to do with a rational will, but is rather the product of accidental impulses and their dependence on the world of sense and physical Nature.

We may conclude, then, that the physical needs of man, no less than his knowledge and power of volition, receive in fact, each in its own sphere, a satisfaction in the world, and deliberately break up the contradiction between the subjective and objective, that is to say, between the freedom of consciousness and the external necessity of things with which it is confronted. The content, however, of such a freedom and the satisfaction which is therein experienced is still subject to *limitations*, and for this reason both still retain an element of *finitude.* And wherever we find such an element supervening it is inevitable that the original contradiction should again reassert itself, and the self-satisfaction only maintain a relative significance. For example, in the sphere of jurisprudence and its realization in the State it is true enough that the rationality of each citizen, his will and his freedom are recognized; he is a person and as such is respected; he is the owner of property, and if that property is in danger the courts of law reassert his rights in their integrity. This recognition, however, and the freedom it establishes are confined to single relations and isolated objects, such as a

particular house, a sum of money, some particular right or law, in fine some particular transaction in the practical world. What the consciousness has at any one time before it are particular things, which no doubt are related to one another, and in fact form a nucleus of such relations; but, on the other hand, they are appropriate to categories of purely relative validity, are subject to various conditions of tenure, which make the satisfaction only immediately experienced when their predominance is reasserted, or at any rate fail to establish any degree of permanence. And further than this the life of the State in its organic entirety, as a related whole of monarch, government, courts of justice, military control, and general grouping of all the various societies which compose it, no less than the obligations and duties which such arrangements presuppose, the aims and satisfaction to which they are directed, the entire scope of its civic and commercial activities already referred to, in one word the complete organism of a nation's life, is indeed in a genuine State complete in itself, and in a sense rounded off as a real totality. At the same time we must observe that the fundamental *principle*, for the realization of which the State exists, and wherein the individual man finds his satisfaction as a citizen, is, despite all the variety of that life, all the manifold differentiation of class within itself and as related to the world without, still a whole that is *one-sided* and in a real sense abstract. It is only the rational freedom of the *will* made explicit in a particular totality. It is, in short, only the national life, and further the life of a *particular* nation; a life, moreover, in which freedom is realized in a *particular* sphere of existence as individualized reality. And on this account it is that we are necessarily conscious, that rights and obligations in the mere bounds of civic existence, on the plane, that is to say, of merely this world's or temporal existence, do not discover the absolute satisfaction we are seeking. We require as rational beings a higher realization of their objective truth as private individuals, a fuller sanction of their imperative

validity than they themselves, in such a sphere, can offer us. What mankind, pressed on all sides by the boundaries of his purely terrestrial life, in fact requires is that region of more essential reality, in which every opposition and contradiction is overcome, and freedom can finally claim to be wholly at peace with itself. And this is, of course, nothing other than absolute Truth itself, no merely relative truth. In the Truth, according to its highest notion, all must be brought home to one unity. In it there can be no more opposition between freedom and necessity, Spirit and Nature, knowledge and the object of knowledge, law and impulse, between whatever form, in fact, the opposition of these contradictory phenomena of human experience may assume.

It is in virtue of such truth that proof is possible that neither a freedom which is essentially subjective and disparate from every element of necessity is true in the absolute sense; nor, on the other hand, is it admissible to predicate truth of a necessity conceived in absolute isolation from consciousness. Our ordinary conscious life fails to overcome this contradiction, and either plunges desperately into the same, or thrusts it on one side and makes its escape from it in some other way. Philosophy will, however, so address itself to the two determinating factors of the contradiction as to show that they are apprehended as isolate from each other in abstraction, not according to their concrete notion; and by the grasp of this latter it will demonstrate the one-sidedness in its relative character, placing these opposing aspects in the fuller union and harmony which is truth. It is the function of philosophy to grasp and formulate this notion of truth. Unquestionably philosophy recognizes the concrete notion throughout; and it is in virtue of this that it is Thought with full grasp of truth. But what we call the notion is something other than this, truth, that is, in its essential verity together with the existence which is either adequate to it or is not so. In all finite reality the determinations, which are essential to

ideal truth, appear separable from each other, dividing the veil of that which in its absolute Truth is a complete totality. Take the case of a living being. Under such finite categories we are forced to regard it as a subject in opposition to the inorganic Nature which environs it. Both the points of view are no doubt present in the notion, but they are there reconciled. Finite existence, however, thrusts them apart. It is, in short, an existence or reality which is unequal to the unity of the notion. We may therefore say that the notion is valid in every sphere of actuality. At the same time the main point to be determined is whether the notion in its ideal concreteness is actually completed in the particular unity presented, wherein the two aspects posited in opposition persist in no ultimate self-subsistence and coherence over against each other, but are rather ideal phases which tend to pass into a higher unity which cancels such opposition. And the reality of this highest mode of union is only reached when we enter the sphere of truth, freedom, and the satisfaction which they create. The higher life which belongs to this sphere, this supreme enjoyment of truth, which as feeling is called "blessedness," and as conscious thought "contemplation," we may describe generically as the life known to religion. For religion is just this universal domain[184], in virtue of which the *one* concrete totality of the World comes to each man in union with himself, as his essential substance, while it remains no less for consciousness the essential truth of Nature. And it is this profounder truth of the Real which alone proves itself invincible over all that is merely particular and finite, being as it is the one absolute harmony wherein all that is otherwise discordant and opposed is finally resolved. Now it is through its direct concern in the true, regarded as the absolute object of consciousness, that Art belongs to the supreme sphere of Spirit, and it is to be placed, in respect to its content, if in a more specific sense, on the same basis as religion and philosophy. I connect these two last for the reason that philosophy has no other object than God. In its substance it is in

fact rational theology, and in its service of the truth a continual service of God.

(*e*) Accepting, then, this fundamental similarity of content these three spheres of absolute Spirit only differ in the *forms* under which they present their object, that is, the Absolute, to human consciousness. The differences which are perceptible in these modes of presentment are due to the notion of the absolute Spirit (Mind) itself. Spirit, in its truth, is essential substance brought home to itself. It is, therefore, no essence which lies outside and in abstract relation to objectivity, but rather is, within the compass of that objectivity, the re-collected presence[185] of the substance of all objects within finite spirit. It is the finite which grasps its own essential universality, and, in doing so, grasps essential Being in the absolute sense. The *first* mode of this comprehension is an *immediate* one, that is to say, it is a sensuous cognition, a cognition in the form and semblance of the object of sense-perception, in which the Absolute is presented directly to the understanding[186] and feeling. The *second* form is that of the *conceptive* or imaginative consciousness. *Last* of all, we have the *free thought* of absolute Spirit. The form of *sensuous perception* is appropriate to art in the sense that it is art which presents truth to consciousness in its sensuous semblance; but it is a semblance which, under the mode of its appearance, possesses a higher and profounder meaning and significance, although it is not its function to render the universality of the notion wholly intelligible through the medium of sense. It is indeed rather the *unity* to which art attains with that of the particular appearance which constitutes the essence of the beautiful, the essence of the artistic product. This union is perfected in art not *entirely* through sensuous objectification, but also through the medium of *imaginative conception.* This is exceptionally so in the art of poetry. At the same time, even in this, the most intellectual or ideal art, the union between significance and the individual mode of its presentation is

present with the same, although it is displayed to the imaginative consciousness, and every part of its content is conceived in its immediacy and visualized for the imagination[187]. And generally we must accept the fact that art, possessing as it does truth or Spirit for its object, is unable to reproduce the same by merely copying particular objects of Nature, such as the sun, moon, earth, and stars. Such are, no doubt, objects of sensuous perception; but, simply as such, they are isolated and can offer no reflection of what is spiritual. In thus attributing to art this absolute significance as a manifestation of Spirit we have expressly set on one side the conception of art which finds its content of too various a nature, or too much occupied with interests foreign to it, to merit such a view. And at the other extreme religion, no doubt, frequently summons art to her service, in order to bring the truths of religion more near to the emotion, or to clothe the same in imaginative form. In both cases unquestionably art is rendering a service to a province not, in strictness, its own. At the same time where art is found in most exalted perfection, in that case no doubt it unfolds in plastic guise the mode of exposition most adequate and essentially necessary to the content of the truth accepted. Among the Greeks, for example, Art was the highest medium under which the community conceived its gods, and became conscious of truth. For this reason we may justly say that the poets and artists of Greece created the gods of their people. In other words, they defined for the imagination of their people the active life and energy of the Divine Presence, giving Them the definite content of a religion. And this statement must not merely be taken to imply that all Greek artists did was to clothe in imagery or embellish with the beauty of poesy vague conceptions and hearsays which, as general religious maxims or isolated determinations of conscious life, were already present before the era of such poetic creations. The truth of this artistic production is rather to be found in this, that art and poetry were the exclusive forms in which these creative artists

could bring to life and expression the ideas which fermented in themselves. In other phases of that consciousness, where we find the content less completely represented by the plastic imagery of art, the scope of Art as the handmaid of religion is of less importance.

We have thus indicated what was, at any rate, once the true position of Art in its relation to the highest interests of man's spiritual life.

But inasmuch as art is preceded in Nature and the finite processes of life by a kind of antenatal history, so too there is a history that follows its culmination, which in other terms passes over and beyond its purely conceptive or plastic grasp of the Infinite. For art carries in the notion that gives it life a limit; and it is from this boundary that the human consciousness passes beyond into forms more adequate to its spiritual import. It is this inherent *shortness of the mark* that fixes the subordinate position we are only too ready to assign to art in our daily life nowadays. For us European art is no longer the highest means in which the actuality of truth is possessed. Speaking generally, thought has long ago pronounced a verdict upon art when it defined it as the portrayal of the Divine by concepts which appeal to sense-perception. This was the judgment passed on it by the Jews and the followers of Mohammed. Nay, we find it present among the Greeks themselves, as the strong opposition of Plato and Homer and Hesiod to the popular conception of the gods proves clearly. There is a period in the education of every civilized nation, when art becomes a sign-post, as it were, to that which stands beyond her border. The evolution of Christendom is itself an illustration. The historical features of that religion, the resurrection of Christ, His life and death, have doubtless offered to the art of painting a mighty field on which to exercise its imaginative bounty; and the Church has either surrounded such art with its magnificent protection, or suffered it simply to work on unheeded. But as the love of knowledge and scientific research, and yet more the felt want of a more

intimate and personal spirituality necessitated the Reformation, the religious imagination was called away from the sensuous medium which enwrapped it, and centred once for all upon the inward spirituality of emotional life and conscious thought. In this way there grew up, so to speak, that posterior twilight of Art's history I referred to, where the want has found a dwelling in man to rest satisfied alone with the pure medium of the soul as the ultimate form of truth. In the earliest beginnings of art we shall find mystery still present, a secret strain and longing which persists because Art's imaginative powers are unable to envisage to sense the complete truth of its content. When once, however, the mind of man has succeeded in endowing such content with perfect outward shape in art, it is driven inevitably away from this objective realization to its own free spiritual activity as from something repellent to it. A period such as this is our own. We may, indeed, express the hope that art will rise to yet higher grades of technical perfection; but in any case Art in its specific form has ceased to meet the highest requirements of spiritual life. We may still wonder at the unrivalled excellence of the statues of the gods of Hellas, and imagine that God the Father, Christ, and the Virgin Mary have received ideal representation at the hands of more recent painters. But it is of no use. Our knees no longer bow to them.

The sphere of conscious life nearest to that of art is that of religion. The form which belongs to the religious consciousness is that of the *imaginative concept.* The Absolute is here removed from the externality of artistic production, and received in a more spiritual way by the imagination, so that the heart and emotions, the inner life of the individual that is to say, become its vehicle. This progress in spiritual insight from art to religion may be further defined by the statement that art is only one aspect of the religious consciousness. In other words, when a work of art objectifies the truth or mind for sense-perception, and apprehends this form of the Absolute as the

one appropriate to its vision, religion blends with the same the devotional attitude that flows from the inner life confronted with the absolute reality as thus presented. Devotion is a type of emotional existence which is, strictly speaking, outside the province of art. It originates in the fact that the individual suffers that object which art has rendered visible to sense to penetrate the arcana of his emotional life, and so completely identifies himself with it that this inward presence, which the imagination and the inherent might of feeling has rendered possible, becomes an essential phase in the manifestation of absolute reality. Devotion is this cultus of the community in its purest, most intimate, and subjective form; a culture, in which the principle of objectivity is at the same time consumed and absorbed, and the content thereof is transmuted without such objectivity into the possession of heart and soul.

The *third* and last form or phase in the evolution of absolute mind (spirit) is *philosophy.* In the boundaries of the religious sphere, where God is apprehended in the first instance perforce as an external object, and men are taught that there is a God, and how He has revealed Himself and still is revealed to mankind, the subjective consciousness is indeed made the vehicle of such knowledge, and the religious sense imparted stirs and fills the heart of the community; but the inwardness of devotion which is born of the emotions and the imagination is not the highest form of inwardness. We are bound to recognize that the purest form of knowledge is conscious *thought* in its freest activity. In this alone the content of knowledge is, adequate to the demands of that which is consciously apprehended: here alone we are in the presence of that most intelligent form of cultus, which seeks wholly to appropriate to itself, and to grasp in concrete thought what is otherwise only the evanescent content of feeling or the imagination. In the purview of such a philosophy art and religion, as two aspects of one truth, become related under a unifying conception. On the one hand, though

philosophy, by its surrender of all sensuous externality, has lost the *objective* presentation of art, yet it has exchanged it for the highest form under which concrete reality is objectively apprehended and redeemed, in other words, that of *speculative reason.* It has, on the other, lost the emotional subjectivity of the religious consciousness in the same pure medium. For while human thought is the most inward and appropriate vehicle of subjective life, such thought, in its fullest grasp of truth, the Idea, is actuality in the most objective and universal sense of the term, and is only to be apprehended by pure thought in the medium native to itself.

With this adumbration of the difference between the spheres of art, religion, and philosophy we must on the present occasion rest content.

The sensuous mode of consciousness is that which first appears in the history of mankind. The earliest stages of religion are for this reason indistinguishable from a religion of art and its sensuous manner of presentation. In the religion of Spirit for the first time is God as Spirit cognized also on a higher plane, and one more adequate to thought, wherein it likewise follows as a corollary, that the presentation of truth in sensuous shape is not truly adequate to Spirit.

Now that we know something of the position which art occupies in the field of spiritual activity, and that which belongs to the philosophy of art among the several philosophical sciences, we will proceed in this introductory portion of our work in the first place to investigate the general idea of the beauty of art.

[175] The German word here is *Geist.* I have translated it as best seems to suit the particular context in which the German word occurs.

[176] *Unendliche Negativität.*

[177] This is the “Ought” of practical feeling. As such just as in the case of the analytical sciences, what it lacks is objective determination (see “Phil. of Mind,” trans. of W. Wallace, p. 94).

[178] *In seiner Gemeinde.* We should rather expect *in seiner Gebiete.*

[179] The reference here appears to be to the three attitudes of thought to the objective world which may be generally indicated as that of ordinary consciousness, that of empiricism and that of speculative Philosophy. In the paragraph which follows, however, Hegel mainly refers to the logical process of dialectic and the Idea of Nature (*die natürliche Idee.*) The latter may, however, refer to both the previous divisions, *i.e.*, the commonsense point of view and the scientific.

[180] The spheres of art and social life are first perceived as merely independent circles of activity.

[181] That is to say, nations have not only found in Art the best means of expressing their religious consciousness, but, even where religion has been raised to a higher power, have found in it the most adequate form in which to express the ideality of their general spiritual life.

[182] *Welche sick durch alles hindurchzieht*, *i.e.*, which permeates all experience.

[183] In this metaphysical passage Hegel appears to be contrasting his own philosophical standpoint, absolute idealism, with that of critical or empirical philosophy, those at least who conceive reality either as a thing-in-itself, or the *materia* supplied to sense-perception from a world outside the human consciousness. The entire content of the Real is, on the contrary, all included under the form of self-conscious thought.

[184] He means, I think, province of the universal, rather than “universal expansion of horizon.”

[185] The words of Hegel are “*innerhalb derselben im endlichen Geiste die Erinnerung des Wesens aller Dinge*.” He no doubt has in his mind the derivation of the word *Erinnerung.* It is the *inwardization* or idealization of such substance.

[186] *Anschauung*, that is to say, it is the object of man’s receptive senses.

[187] The punctuation is clearly wrong. It is also very possible that *derselben* is a misprint for *dieselbe.* But in any case there should be comma rather than semicolon.

SUBDIVISION OF SUBJECT

IDEA OF THE BEAUTY OF ART, OTHERWISE, FINE ART

TO ARRIVE AT the Idea of Fine Art in all its concreteness it will be necessary for us to consider it under three phases.

1. The *first* is concerned with the *notion* of the beautiful generally.

2. The *second* is that of *natural* beauty, the defects of which will demonstrate the necessity of the *Ideal* as *Fine Art.*

3. In the *third* of these aspects the subject of our investigation will be the *Ideal* in its *positive realization*, in other words as the artistic display of this Ideal in particular *works of art.*

CHAPTER I

THE NOTION OF THE BEAUTIFUL IN ITS GENERAL SIGNIFICANCE

WE HAVE DEFINED beauty to be the Idea of the beautiful.

1. The Idea. By this definition is implied that we have to conceive the beautiful as Idea, and, moreover, as Idea in a determinate shape, as *Ideal.* Idea, as thus posited, is just this, the conceptive notion, the realization of the same, and the unity of both. The notion, as such, is not yet the Idea, although the terms notion and idea are often loosely interchanged. Idea is the notion only as presented in, and brought into coalescence with, its objective reality. This unity, however, is by no means to be regarded as the mere *neutralization* of notion and reality, so that the individual character and quality of either is absorbed; as, for example, where we find that in a chemical compound salt-potash and acid tend to neutralize each other in so far as they have weakened their opposition. In this unity, on the contrary, the notion is retained as the commanding factor. It is already implicitly, in virtue of its own nature, this very identity. Out of its own wealth it evolves the reality as part of itself, by means of a process which, being no other than that of development, surrenders nothing of its own nature, but brings into more concrete actuality the riches of the notion, and for this reason continues in unity with itself and its objective realization. Such a unity of the notional concept and its realization is the Idea defined in abstract terms. The word idea is, of course, frequently used by authors of works dealing with the theory of art. It must, however, be admitted that many connoisseurs of high standing are particularly severe upon its employment. The latest and

most interesting example of this polemical attitude is to be found in Herr von Rumohr's "Italian investigations." This work is based on the practical interest that the arts excite, and is wholly unconcerned with that which for brevity we may call the Idea. The truth is that this writer, who appears to have no knowledge of the development of philosophy in modern times, freely confuses the expression as above defined with the undetermined conceptions of the phantasy, or the abstract and characterless Ideal of well-known art theories or schools of art, ideas which present a lean contrast to the clearly defined and richly caparisoned objects of Nature in their truth, and which this writer opposes to the idea and empty Ideal, which the artist himself evolves from his own consciousness. We have, of course, no more right to suppose that creative work can be the result of such poverty, than we can with justice assume that a thinker can think with conceptions wholly indeterminate, and persist in his thought with a content destitute of all defined relation. Such an objection, however, does not apply in any respect to the Idea in the sense we use the expression. This Idea is through and through concrete; a whole which consists of relations and is simply beautiful from being in direct union with the objective form adequate to its expression.

Herr von Rumohr has placed on record in this very book (Book I, pp. 145-46) the following assertion, that "beauty in the most comprehensive meaning of the term, and as it is understood by intelligent people of our day, includes every quality of an object, which may either stir the sense of sight with satisfaction, or through that sense attune the soul and delight the mind."

These qualities are then further subdivided into three classes as follows: "First, there is all that is perceptible through the eye; secondly, that which is apprehended by means of the peculiar, presumably innate sense of mankind for spatial relations; and thirdly, all that in the first instance works upon the

understanding, and only indirectly through cognition on the emotions." This third and most important determination rests apparently on forms "which quite independently of all pleasure to the sense and the beauty of extended shape arouse in us a specific delight which is ethical or spiritual in its quality, which in part to all appearance proceeds from the enjoyment we derive from the images excited (I presume he means ethical or spiritual ones)[188], and in part from the pleasure which the mere activity of an intelligent appreciation infallibly brings with it."

Such are the principal factors according to which this undoubted connoisseur of art defines his subject relatively to the beautiful. It may very possibly pass muster with a certain type of uncritical reader. It is, however, very unsatisfactory regarded from the philosophical standpoint. For what does it at bottom amount to but this, namely, that the sense of vision or spiritual sense, we may add the understanding itself, are moved pleasurably, or excite a feeling which results in awakened pleasure. The entire argument hinges on this one aspect of awakened gratification. This reduction, however, of the activity of the beautiful to terms of feeling — that which pleases and charms us — has been disposed of once for all by Kant. His exposition has already left far behind the feeling for the beautiful.

We will direct our attention now from this polemical tractate to a further consideration of the Idea its hostility has failed to weaken. In this, as already stated, is comprehended the concrete *unity* of the *notion* and its objective realization.

(*a*) Now, first, we will observe, in directing our attention more closely to the essential nature of the notion, that it is no purely *abstract unity* opposed to the *differences* of *phenomenal reality*; rather, as the notion, it is already the unity that integrates those relations, and by doing so is concrete totality. The abstract conceptions such as man, the quality blueness, and their like, are not notions as such at all, but rather should be called abstract general

concepts, which are only raised to the dignity of the notion, when we have demonstrated that they contain opposing factors in unity, and, in such a way, that this self-related nexus of unity constitutes their notional truth. For instance, the concept "blueness" as a colour receives such a notional value when it is grasped as the unity, and, indeed, the specific unity of light and darkness[189]. In the same way the concept "man" contains within it the opposing factors of sense, life, and reason, body and mind (spirit); but a particular man is not to be regarded as a whole consisting in some way of these two aspects of his personality placed in a relation of indifference side by side as constituents of the same. Rather, in virtue of the notion, such a whole contains these constituents in concrete and mediated[190] union. Add to this that the notion is so completely the absolute bond and unity of its differences, that independently they cease to exist, they are unable to assert the particularity, in virtue of which they might escape from such a union. For this reason the notion includes all its determining constituents in the form of its own *ideal unity* and universality, which constitute its *subjective* character in contradistinction from the real as the object of sense-perception. For example, gold is, as a particular object, of specific weight, definite colour, and placed in a certain relation to specific acids. Such are varied characteristics of gold, and yet are invariably found in a unified whole. The smallest speck contains them all in inseparable union. By analysis or abstraction we indeed separate them, but in their notion they are inseparably one. The inability of the differences, which the notion in its truth essentially possesses, to stand alone in their isolated self-identity is of a similar nature. A still more apposite illustration is presented by the unique concept of the self-conscious Ego in its universality. For that which we call soul, or more appositely the Ego, is the notion itself in its free existence. The Ego contains a congeries of most distinct concepts and thoughts in itself; it is a world of ideas; yet none the less this infinitely complex

content, in so far as it lies within the Ego, remains without a vestige of substantiality or materiality packed within this ideal unity, as the pure and throughout fluid transparency of the Ego itself reflected to itself. And this is precisely the way in which the notion retains its varied determinations in ideal unity.

The determinants of the notion which are most cognate to the notion as such are the *universal*, the *particular*, and the *single*. Every one of these determinate qualities taken by itself is a mere abstraction. As thus regarded, however, abstract, that is to say, from one another, they are not present in the notion: that is rather their ideal *unity.* The notion is therefore the universal, which, on the one hand, negates itself to a condition of relativity and *particularization*, but, on the other, this riving asunder, in so far as it is negation of the universal, is itself again *annulled.* For the universal as present in the particular, which itself is only the particular aspects of the *universal* itself is present in no particular absolutely, but rather in that very particular reaffirms once more its essential unity as universal. In this return upon itself the notion is infinite negation; negation, I mean, not as against another, but self-determination, in which alone it subsists in its positive and correlative unity. In this way it is *singularity* in its truth; it is the universal nexus which shuts itself up with itself in its particulars. As the highest example of this property of the notion we would refer back to what we have already, if in a summary way, said about the essential activity of Spirit.

Through this infinite capacity of return upon itself the notion is already, by virtue of its intrinsic wealth, totality. It finds the unity of itself in the being of another, and for this reason possesses a free activity, being, however, negation as self-determination, not as the alien limitation of its own substance through something other than itself. But regarded as such totality the notion is already in potential possession of all phenomenal reality, and is that which mediates and restores the unity of the Idea. And

whoever ventures to think that in the Idea we have presented to us something totally different and apart from the notion, has as little knowledge of the nature of the Idea as he has of the notion. At the same time there is, no doubt, a difference between the notion and the Idea, and it is this: in the former the particularization is only an abstract particularization, for this reason that in the notion the determinate relations are alone coherent in its transparent medium, that is to say, in its unity and ideal universality. The notion, therefore, itself remains subject to the one-sidedness of its particular material, and is hampered with the defect that although in its own nature it is a totality, yet it is only in the aspect of it as unity and universality that it is entitled to free self-development. But inasmuch as this defect in its completeness is foreign to its own essential form, the process of its activity is to remove it. It negates itself as this very ideal unity and universality and allows that which is enclosed in the barren chamber of ideal subjectivity to flow forth freely into real and substantive *objectivity.* In other words, the notion through its own activity posits itself as objective reality.

(*b*) Objectivity is therefore, truly apprehended, the *real existence* of the *notion.* It is, however, the notion under the mode of self-substantive particularization and of a differentiation of all *antithetical* phases[191] of reality, whose ideal unity the notion in its subjective capacity constituted.

But inasmuch as it is the *notion*, and only the notion, whose function it is to endow objectivity with its determinate existence and reality, so too it is only through objectivity that the *notion* is unveiled in its actuality. The notion is, however, the mediating and *ideal unity* of all its particular antitheses. Within its differentiated reality this ideal unity, effective throughout particularity in modes adequate to the notion, has to establish itself in them, precisely in a way similar to that in which the realized particularity of their unity, as thus mediated to the point of ideality, has also

to exist in them[192]. This is the might of the notion, which refuses to surrender or forfeit its universality among the *disjecta membra* of the objective world, but rather reveals its essential unity through such reality and within it. For it is nothing less than the very life of the notion to preserve its unity in the material which is offered it. Only by so doing is it real and veritable totality.

(*c*) This totality is the *Idea.* The Idea is not simply the ideal unity and subjectivity of the notion. It is quite as much its true and objective reality; it is, however, an objectivity which does not confront the notion as an opposing factor, but is rather that in which the notion itself is self-determined. In whichever aspect we contemplate the notion, whether as subjective to our apprehension, or as objectively real, the Idea it manifests is a totality. But it is more than this. It is the unity which for ever is mediating between and bringing into more perfected harmony the two totalities. Only as thus apprehended is the Idea truth and indeed all truth.

2. All that exists, then, has only truth in so far as it is a definite existence of the Idea. For the Idea is alone the truly real. The truth of the phenomenal is not derived from the fact that its particular existence is of an inward or external character, and as such is in a general sense reality; it is so wholly in virtue of the fact that such reality is adequate to the notion. Then alone is determinate existence real and true. And the truth, to which we here refer, is not a *subjective* interpretation of it, namely, that a particular existence is accordant with my own conception of it. It is truth in the objective sense that the reality of the Ego, or of any external object, action, or circumstance actually contributes to the realization of the notion. If this identity is not established the existence remains purely phenomenal. Instead of the objectification of the notion in its completeness what obtains is purely a detached aspect of it; and with regard to this, whatever self-subsistence it may appear to have in opposition to the unity and universality of the notion,

such can only work to its final confusion by setting it in hostility to the true notion itself. Our conclusion, therefore, is that only the reality which adequately expresses the notion is truly reality, and the reason it is so is that therein the Idea manifests itself as existence.

3. We have maintained that beauty is *Idea*. It follows that *beauty* and *truth* are, in one aspect of them, *identical*. In other words, beauty must itself in its intrinsic being be true. A closer investigation will further show to us that truth must be *distinguished* from beauty.

The idea is true in the sense that it is so by virtue of its essential being and according to its fundamental principle[193], and as such truth it is thought[194]. It is not its sensuous and external existence, but the *universal* Idea of thought as present in this. At the same time the Idea is driven to seek its realization in external and objectively determined existence, both in the sphere of Nature and that of Mind. The true, in the absolute sense, also exists. And in so far as, in this its external existence, it is immediately apprehended by consciousness, and the notion rests in immediate unity with its external appearance, the Idea is not only true, but is also *beautiful.* The *beautiful* may therefore be defined as the *sensuous semblance*[195] of the Idea. For the sensuous condition and the objective world generally maintain no real self-subsistence in beauty, but have merely to surrender the immediacy of their *being.* In beauty such are posited simply as the determinate existence and externality of the notion, and as a form of reality, which itself manifests the *notion* in unity with its external appearance in this its particular objective existence. For this reason it can only pass as the semblance of the notion.

(*a*) Accordantly with this it is impossible for the understanding[196] alone to grasp the significance of beauty. For inasmuch as objective reality is apprehended by this faculty as something at least quite other than ideality, sensuous perception, as something very different from the notion, the

external object as something that is anywhere rather than within world of the conscious self, to that extent it cannot fail to emphasize the contradictions implied in such separation, rather than penetrate to the ideal unity we have above described. The understanding remains rooted in the finite, the incomplete and untrue abstraction. The beautiful is on the contrary itself essentially *infinite* and free.

For although the content of beauty is stamped with particularity and to that extent limited, such content is essentially in its mode of environment a totality that is infinite[197] and a free existence; and it is both for the reason that it is the notion, which does not pass beyond this its objective semblance, and so fall into finite and one sided abstraction with it, but rather is immersed as a blossom with this its objectification and through the imminent unity and perfection of such inclusion is revealed as essentially infinite. With equal truth we may affirm that the notion in sealing, as it were, with a soul the real existence, in which it is part of the objective world, is itself by itself freely manifest in that world. For the notion will not suffer that external existence in the sphere of beauty to follow, as it would otherwise, the laws that therein are paramount: rather it determines out of its own riches the articulation and form of its appearance therein; and it is precisely this harmony of the notion with the mode of its external existence which constitutes the essential life of beauty. And the bond which braces all together, no less than the power behind it, is self-conscious life, unity, soul, and artistic personality.

(*b*) We conclude, then, that if we consider beauty in its relation to conscious life, on the *subjective* side that is, it is neither to be adequately apprehended by an intelligence that persists in the unfree medium of purely finite existence, nor is it the object of the finite Will. We will enlarge a little on both points.

As finite intelligence we are aware in feeling of the inner no less than the outer objects of consciousness; we observe them, perceive them to be true to our senses, allow them to form part of the content of our perceptions, concepts, and finally, no doubt, to become the abstractions which our understanding presents to us, reflecting on their appearance, and endowing them with the abstract form of universality.

Now the finiteness and absence of freedom inseparable from this mental attitude consists in the assumption that the things perceived are self-subsistent. We direct our attention to these objects, suffer them to impress us, form our ideas of them, possessed with the faith in their material existence as objects, and convinced that all we have to do is to perceive them as they appear to our passive reception, to preserve, in short, the formal side of our attention intact, holding such unfettered by our fancies, opinions, and prejudices. In thus accepting this one-sided freedom of objects we posit at the same time the want of freedom in their mental apprehension. To such the content is one wholly *given* from outside; and instead of a true self-determination through difference we have nothing but the reception and acceptance of what is presented as a part of the objective thing. We would arrive at truth by the suppression of all that belongs to ourselves[198].

A criticism of like nature, though the defect is here just at the other extreme, may be applied to the finite *Will*. In this theory interests, objects, intentions, and conclusions are all relegated to the subject, whose will it is to enforce them as against the existence and properties of the material thing. This it can only do by the annihilation of the object itself, or at least, in so far as it can modify or change its form and energies, by transmuting its qualities, or permitting them to exercise such a change on each other, as water may exercise on fire, fire on iron, iron on wood, and so forth. We now find that it is the particular things, which the subject has enrolled in its

service, as things to be regarded and treated as *useful*, which in their turn have been deprived of their self-subsistence. In other words, they have come to be regarded as objects, whose notion and meaning is not their own, but derived from the reflecting consciousness, so that what is most essential to them is precisely this relation of service in which they stand to the subjective purpose, that is, our own intelligence. The values of either side of the relation are thus completely reversed. The objective thing has lost freedom and the conscious subject secured it. As a matter of fact, the freedom on *both* aspects of the relation is, owing to the finitude and abstraction it implies under such a view, a purely supposititious one.

In the sphere of *theory* here it is the assumed independence of the objective world which creates the finitude and bondage of the conscious Ego. In that of the practical world this dependence is due to its one-sidedness, the conflict and contradiction of its aims within and the impulses and passions which press from without, no less than to the unreconciled opposition of a world of objects. For the separation and opposition of these two aspects of one whole, that is, objects and relating self-conscious life, is presupposed in, and indeed is an accurate definition of, this point of view.

And, similarly, with reference to the lack of freedom in the object. Here, too, in the sphere of intelligible conception, the independence of the object is assumed, but the freedom assumed is only apparent. For it is only posited as bare objectivity without securing the presence of its notion, as the unity and universality of the conscious subject, within such objectivity. It still remains outside it. Every object thus placed external to the notion merely exists as particularity, which comes back to us in external guise together with its manifold, and is, in all the unlimited scope of its relations, through its contact with other objects, subject to the conditions of its origin, change, opposing force and final overthrow. In the *practical* world the dependence

of the object is expressly, in this view, assumed, and the opposition of the thing is posited in definite relation to volition without possessing in itself the power of ultimate self-subsistency permitted to the latter.

(*c*) The apprehension of the object as *beautiful* unites these two abstract points of view. It in fact annuls the one-sidedness of both whether relatively to the subject of consciousness or its object, and by doing so cancels the finitude and lack of freedom which characterize them.

Philosophically regarded[199], the reason is this, that the object is not apprehended in its existence as an isolated thing whose notion as the object of human thought is removed from the objectivity which belongs to it as something outside it, and which in its particular reality extends and is dissipated in every conceivable direction as a manifold content of intelligible relations. An object which is beautiful suffers its own notion to appear as realized in its objective presence, and reveals in that appearance the unity and life inseparable from the conscious subject. For this reason the object may be conceived as sweeping back into the curve of its unity that impulse of continuous externality, cancelling its dependence on other objects, and transmuting to our vision its unfree finitude into free infinity.

Furthermore, the Ego in its relation to the object of beauty ceases to be merely the abstract attention or sensuous perception, and the floating away of such perceptions into equally abstract reflections. Rather, it is itself concretely realized in this object, being at once the unity and reality of its notional idea, and uniting for itself in its rounded concreteness that which has hitherto remained, as abstractly perceived, apart in the Ego of the subject of perception and the thing perceived.

Coming now to the practical import of this relation as it applies to the object of beauty, we have already drawn attention to the fact at some length, that in the contemplation of it the element of sensuous passion drops away. All personal impulse that the individual may feel toward the object is done

away with through that very aesthetic contemplation, which regards it as self-subsistent in itself, in other words, its own object. For this reason, the purely finite relation of the object also disappears, the relation, that is, in which it subserved, as a means for their realization, aims which were foreign to it, and towards the fulfilment of which it was either presented as unfree or was compelled to take up, however strange, into its own existence. At the same time that relation of the Ego in the practical world which we found to be unfree disappears, inasmuch as it differentiates itself no longer in subjective motives and their means or material, remaining fixed in the finite relation of the formal "ought" for the carrying out of its subjective ends in the object, but is here confronted with the notion and its aim completely realized.

We may say, then, that the aesthetic contemplation of the beautiful is a liberal education, a portrayal of the object in its free and infinite being, with no detracting consideration of its use or employment for finite wants and purposes. Further, the *object* as a *thing of beauty* is neither under force or compulsion at our hands, nor is it in conflict with and overcome by other things outside it. It is of the essence of beauty that the notion, end and soul thereof, no less than its existent form, and variety generally, manifest themselves out of their own intrinsic wealth rather than through the energy of something outside them. The reason of this lies in the fact, already insisted upon, that their truth consists solely in the unity and harmony of their notion with their objective existence. And inasmuch as the notion is itself concrete totality, its objective reality also appears as a manifestation of the same, homogeneous in all its parts, which, as thus imbedded in the notion, appear to fall into such ideal unity and animation. For this harmony of the notion and its envisagement is nothing less than perfected suffusion[200]. Accordingly the exterior form and shape is manifested, not as such by its separation from other material, or as an impression mechanically

related to aims which are foreign to it, but as the form of reality wherein the notion accommodates itself out of its own stuff and substance. Finally, however much the particular aspects, parts or articulations of the beautiful object are presented in the ideal unity of the notion and its unified envisagement, that harmony must be so rendered visible to sense, that in relation to one another they preserve the semblance of self-subsistent freedom; in other words they must not only possess the ideal unity of the *notion as such*, but must reflect back the side of a reality which is substantially objective also. Both aspects, in short, must be present in beautiful objects; for these are, on the one hand, the *necessity* posited through the notion and discovered in the harmonious conclusion of these particular aspects, and on the other, the envisagement of their freedom as essentially one with the whole, and *not merely* that of the *unity* which exists between the parts. Necessity in its full definition means the just relation of the two aspects, which coalesce so completely that to posit one is to posit the other. Such a necessity must unquestionably be present in beautiful objects. It is not, however, under the mode of necessity that it appears; rather it should conceal itself beneath the semblance of unintentional accident. Otherwise the particular parts of such a real presence lose the position they should occupy according to their own real existence, and only appear in the service of their ideal unity, to which they therefore remain in abstract subordination.

In virtue of the freedom and infinitude above analysed, which is inherent in the notion of beauty, whether we view it in its objective presence as a thing of beauty, or under its aesthetic contemplation, we disengage the province of the beautiful from the relations of finite condition, to exalt it into that of the Idea and its truth.

[188] This is, of course, a note of Hegel himself.

[189] This, of course, has reference to Hegel's unfortunate belief in Goethe's theory of colour.

[190] Mediated (*vermittelt*), because the concrete is first apprehended through its differences, and only after reflection do we arrive at the notional unity which transcends and unites them.

[191] *Momente.* Phases asserted and reconciled in the evolved notional unity, organic or otherwise. The notion is subjective because it is an ideal unity.

[192] The text is clearly corrupt. The full-stop after *herzustellen* should be a comma, and *auch* would be preferably changed to *als die.*

[193] As essentially reason.

[194] Not the substantive, but past participle.

[195] *Das sinnliche Scheinen.*

[196] *Verstand* in the technical sense of Kant's philosophy; that is, the faculty of scientific observation or ordinary perception — analytical, in contrast to reason (*Vernunft*), the synthetic faculty.

[197] Infinite, that is to say, as human freedom is infinite, as mind is infinite, an ideal totality, a whole complete in itself, not an endless progress, which is a contradiction.

[198] Or, as Hegel says, "by suppressing the subjective principle altogether."

[199] *Theoretischen* here used in sense of true philosophical theory, not one-sided views as above.

[200] *Vollendete Durchdringung*, *i.e.*, a penetration through all parts.

CHAPTER II

THE BEAUTY OF NATURE

BEAUTY IS THE Idea as the immediate unity of the notion and its objective reality, yet is only the Idea in so far as its unity is immediately present in shape apprehensible to the senses and as semblance of the real. The most elementary form of existence, which the Idea take to itself is *Nature*, and the first form of beauty is that of *Nature.*

A. THE BEAUTY OF NATURE AS SUCH

1. In the world of Nature we must distinguish between the modes according to which the notion becomes existent reality in order to be part of the Idea.

(*a*) In the *first* place the notion is absorbed so immediately in pure objectivity, that, in its character of subjective and ideal unity, it wholly fails to assert itself, and passes over instead as a thing without a soul into the raw *materia* presented to sense. The purely mechanical or physical bodies in their isolated singularity are of this order. A particular metal is, for example, essentially no doubt a manifold of mechanical and physical qualities; every part of it, however, has such qualities equally in itself. Such a body not merely fails to possess any entire articulation of its parts in the sense that every one of its different parts receives for itself a particular material existence, but even the negative ideal unity of such differentiation is absent, which might assert itself as animating principle[201]. The difference here is a purely abstract multiplicity, and the unity posited the indifferent equilibrium of identical qualities.

This is the first mode of the existence of the notion. The differences here receive no independent existence, and the ideal unity is not found as ideality. For this reason such isolated bodies are essentially defective and abstract existences.

(*b*) Natural objects of a higher order suffer the differences asserted by the notion to appear as free, so that each one as external to another is itself independently existent. Here we have for the first time the true character of objectivity. Objectivity is just this independent assertion of the segregated differences determined by the notion. On this plane of existence the notion asserts itself in such a way that it is at least a totality of its differences, which is truly realized, in so far as the particular bodies, while they each severally possess independent existence for themselves, are at the same time members of *one inclusive system.* Of such a character is the solar system. In one aspect of them the sun, comets, moon, and planets appear as independent heavenly bodies apart from one another; in another, however, they derive their definite character from being parts of one system of such material bodies. Not only their specific modes of motion, but also their physical qualities, are only to be deduced from their relation to this system. This nexus which binds them together constitutes that inward unity which relates these particular existences together in one whole.

But further than this, in this conception of system the operation of the notion is not exhausted in the *existent unity* of independent bodies as essential parts of it. For just as the differences are real the unity which relates them to the totality has to assert itself as real. This unity, in other words, differentiates itself from the multifold particularity of those objective bodies of which it is the integrating principle. And on this plane of existence it is differentiated therefore itself against such a particularity as real, independent and objective existence. In the solar system the sun exists

over against all particularity related to that system, as such a unity of the system.

Such a material existence of the ideal unity of the notion is still very defective; for whereas on the one hand we have this unity posited in its reality only as the relation or material connection between the severally independent bodies, on the other we have it posited as a body which belongs to that system, whose unity, in opposition to its real differences, it essentially represents. The sun, in short, which we take to be[202] the soul of the system, has itself an independent entity apart from the members which form the explicit content of this soul. It is itself only *one* particular mode or phase of the notion, that, namely, of unity in its *difference* from the actual separation of the several parts, a unity which remains outside itself, and is consequently abstract. For however much the sun by virtue of its physical quality is plainly a principle of unity, the illuminating body as such, this is after all merely an abstract identity. For light is simple, undifferentiated appearance and nothing more. We find therefore in the solar system the unity of the notion indeed objective, and the totality of its differences explicitly realized, each body making visible *one* particular phase[203] of the notion; but here, too, it lies absorbed in its objective reality, and it fails to assert itself in such material as is truly inherent and explicit ideality. The form of its existence which here prevails remains the independent segregation of its particular phasal units[204].

It is, however, essential to the true existence of the notion, that the *differences* of the objectively real, the reality, that is to say, of the separate independent parts and the equally independent unity that is therein objectively realized, should as such be together brought back into unity. Only thus such a totality of innate differences can make wholly explicit either the notion as the realized differentiation of its characteristics, or at the same time release each particular that belongs to it from the element of

isolated independence which it cancels by enabling the ideality, in which these differences recover their subjective unity, to assert itself fully as the universal principle of their animated being. In that case they become no longer *parts* hanging loosely to one another by a bond that still leaves their particularity unaffected, but genuine *members* of one body. They no longer possess an existence in their isolated singularity, but retain such truly in the ideal unity which binds them together. Only in such an organic articulation the ideal unity of the notion is present to the parts thus integrated. It is at once their support and immanent soul; here for the first time the notion is not overwhelmed in objective reality, but passes over into actual existence as the inward identity and universality, which it essentially is.

(*c*) But this *third* mode of Nature's manifestation is a determinate existence of the *Idea*, and the Idea as thus manifested in Nature is *Life.* Dead or inorganic nature is not adequate to express the Idea; only the organic life of Nature unfolds its reality. For in life we shall find, *first*, that the objective reality of the notion as differentiated is presented as such reality; *secondly*, however, that the negation of such differences is entirely one of distinction in that reality[205], the ideal subjectivity of the notion overcoming to itself this very reality; *thirdly*, the unifying principle of animation is now the positive appearance of the notion in the form of its bodily substance, that is to say, the form of infinity, which is sufficiently powerful to assert itself thus formally in its content.

(*α*) If we ask ordinary consciousness[206] for a definition of Life, we have two determinations presented, either the imaginative conception of it as bodily life, or as soul-life. In the same view we distinguish these two determinations with qualities peculiarly belonging to each. This *contrast* we set up between soul and body is also of great importance in the more philosophical consideration of our subject. And it is no less part of our inquiry to investigate it. At the same time we would point out that the

philosophical interest concentrates itself quite as much on the *unity* which exists between soul and body, a part of this inquiry which a really adequate survey of the subject has at all times found beset with the greatest difficulties. It is, however, precisely in virtue of this unity that Life is the first genuine appearance of the Idea in Nature. We must consequently apprehend the identity of soul and body as no fortuitous connection[207], but a union of profounder significance. In other words, we must recognize the body and its members as the objective existence of the notion itself in systematic articulation, which in the members of the living organism, secures an objective existence for its determinate features, analogously no doubt, if on a higher plane, to the facts presented by the solar system. Within this real existence the notion asserts itself in like manner as the ideal unity of all these determinate parts. This ideal unity is the soul. The soul is the substantive unity and interfused universality which is no less a simple relation of self-determining than it is ideal Being-for-itself or self-coherent totality. This is the higher view of the union between soul and body. To put it in other words both are not merely distinct aspects set side by side; they are one and the same totality of identical determinants. Just as the Idea generally can only be grasped in its explicit reality as the notion evolving itself as such[208], in which conception the differentiation and unity of both sides, that is both the notion and its objective reality, are inseparably present, in the same way Life must be conceived as the unity of both soul and body.

And further, the subjective no less than substantive unity of soul within the body is presented us and exemplified in Feeling. The feeling of a living organism is, that is to say, not merely an independent product of a particular member, but it is also this ideal and simple unity of the entire organism. It is carried through every member of the body is felt throughout in more than a hundred places at once; and indeed, to put it shortly, rather than saying there

are many thousand sensitive points[209] in a single organism we should more justly say there is but one, namely, the subject of consciousness. And inasmuch as the animating principle of organic Nature includes in itself this distinction between the real existence of the organic members, and the abstract or simple self-coherence within such parts, which we call the growing soul, mediating between them both by virtue of its inherent unity, such a principle of Life stands on a higher plane than that of inorganic Nature. Only with Life is the Idea existent, and only thus is the Idea truth. No doubt even in the organic world this truth can be extinguished. We find the body unable to perfect its essential ideality and animating energy. Such is the case in disease. Here we find the notion deprived of its controlling sovereignty, and other powers are potent with it. Such a life is, however, defective and crippled: it merely continues, because the inadequacy of reality to the notion has not reached the point of absolute contradiction; it is still only relatively valid. Once assume that all harmony between the two sides is broken, that all genuine articulation of the members of the body and their true identity has dropped away, and life is dissolved in death. The several members are now mere appendages to each other, with no principle of Life to hold them in unsevered unity.

(*β*) We must add that when we stated the soul is the totality of the notion regarded as the subjective and ideal unity, the body on the other hand, as distinguished by its members, is the same totality but rather in its material aspect as the juxtaposition and sensuous accretion of all the several parts, affirming at the same time that both soul and body are posited as *one* in the living organism, there is no doubt something contradictory in the statement. For the ideal unity, so far from being this material juxtaposition of parts, in which each particularity possesses its independent consistency and exclusive character, is rather in direct antithesis to such external reality. That what is diametrically opposed should nevertheless be identical is

obviously a contradiction in terms. The man, however, who declares the non-existence of anything from the fact that it carries in our notion of it a contradiction which implies the identity of opposed antitheses, simply excludes Life itself from the idea of existence. For the force of Life and still more the power of Spirit (mind) consists in this very movement, namely, to assert the law of contradiction inherent within them, to bear the burden thereof and to overcome it. This affirmation and resolution of the contradiction which obtains between the ideal unity and material juxtaposition of the members, constitutes the appointed *process* of life itself. And Life is simply *process.* And this process of life includes an activity which has two distinct functions. On the one hand it has continually to affirm the material existence of the physical distinctions[210] among the members of the organism thus determined; on the other, just in proportion as such distinctions grow obdurate in their independent particularity, and tend to remain fixed in absolute separation from each other, it has to make good once more that universal ideality, which is the principle of their life. This is the idealism of Life's process. Philosophy is not the only idealism; far from it. Nature herself in her domain of actuality creates in the life-process just that which the philosophy of idealism completes in the world of contemplative thought. Only where we have these two aspects of one activity, that is, the constant realization of the corporeal definition of the organism no less than the synthetic affirmation of such material presentment in the ideal unity, which it is as one with the notion[211], then and only then we have the completed process of Life, whose more primitive forms[212], however, this is not the place to discuss. Through this unity of Life's energy in both its branches all the members of the organism are up held in their integrity, and continually flushed anew with the ideality of their life. This ideality is furthermore declared by the organic parts in the fundamental law of their being, that this unity of Life is not so much an

accidental quality as, on the contrary, the substance of it. In this alone they are able to preserve their specific character. This it is which precisely constitutes the difference between the part of a mere conglomerate and the member of an organism. The particular parts of a house, for example, the stones, windows, and so forth, remain just what they are, whether they form part of the structure of a house, or whether they do not. Their relationship to one another is quite indifferent, and the conceptual notion remains in their case a purely external form, which possesses no life in these parts raising them to the ideality of a subjective unity.

The members of an organism have, it is true, an external reality, but for all that it is the notion of Life which constitutes the inward, nay, the characteristic being of such reality, a reality which is not expressed through one external form uniting them, but in the ideal coherence of their parts in one living whole. For this reason the limbs have no such reality as belongs to the stones of a building, or the planets, moon, and comets in the solar system. Their reality is one wholly within the content of the organism, and all appearance to the contrary is, as such, ideally imposed on them. Dissever the hand from the body and it loses its independent existence as a member of the organism which made it what it was. Its activity, form, and colour, all that constitutes it, is at once changed; it enters the process of corruption, and ultimately ceases to exist[213]. Consistent character it only possesses as a limb of organic life, reality only in constant reunion with that ideal unity which sustains it. And that is just the superior mode of reality which the living organism possesses in itself. The real or positive is for ever being set up as both the negation of itself and withal the ideal resumption of itself, such ideality constituting, in fact, both the maintenance and specific character of the mode under which each of the separate parts of the bodily presence are associated together.

(*γ*) The reality, then, which the Idea wins for itself in the life of Nature is reality as a phenomenal process. Such an *appearance* stated in its simplest terms is this, that a reality exists, but its potential being[214] is not immediately in its possession, rather it is at the same time negatively affirmed[215] in the particular form that belongs to it. The negation of the immediately external and particular members of a body is not only a negative relative relation as the activity of the inherent idealization[216], but is as such a positive realization[217].

Hitherto we have considered the particular objects of the real as positive in their self-exclusive particularity. This independence, however, is negated in the living object, and the ideal unity asserted within the bodily organism is alone found to assert over itself the full force of positive determination. Such a positive ideality in the principle of negation it asserts is the soul. On the appearance of the soul in the body we have at once such an affirmative presence as the one indicated. The soul not merely asserts itself as a power against the subdivision of the bodily members, it is their plastic creator[218], which preserves as inward and ideal that which is externally minted in the shape of physical members. And consequently it is this very positive and ideal inward[219] which appears in the outer structure; in other words, the external, so far as it is a mere external, is a mere abstraction, a mere aspect that is untrue for the whole. In organic life the external we are confronted with is an externality through which the inward is made visible. The outward, that is to say, declares itself in its potential nature as that inward, which is its notion. Further to this notion appertains the reality in which it as notion is made visible. Inasmuch, however, as in the objective world the notion, strictly as such, is the principle of subjective life and self-determined life becoming *explicit* in its own objective reality[220], life exists only as a *living thing*, an individual subject. It is only with life thus concentrated to a point that we find this negating *centrum* of unity. And it is

negative in this sense that the ideal explicitly self-unified totality[221] can only now stand forth in its reality by virtue of this principle of ideality being asserted through the differentiation of its positive presence, together with which the ideal unity of such totality is at the same time incorporated. It is of the greatest importance to make clear this aspect of the principle of subjectivity. It is only as the single living thing thus unified by such a principle that life is actually present.

If we inquire further in what manner the Idea is manifested within the actual life of such living individuals our survey will be as follows: *first*, this principle of Life will be realized as the totality of an organism possessing bodily shape; *secondly*, this physical shape is not presented as a rigid product[222], but as a continous process of ideal generation, in which a living soul asserts itself. *Thirdly*, the changes and determinations through which this totality passes are not imposed externally to it, but are changes of form which are evolved from its inherent nature, imposed on itself and for itself, in a process wherein it stands self-determined as the subjective unity no less than the ultimate end of its being.

This free self-subsistence of the subjective principle of life is especially exemplified in the spontaneous motion of a living organism. The inanimate bodies of inorganic Nature are fettered to the conditions of Space, which limits them to one place, or they are only moved from it by external forces. The motion, in short, does not originate in themselves; and, when it is visible upon them, it appears as an energy which is foreign to them, to remove which the only force they exert is that of reaction. And if the motion of the planets with similar phenomena appear to be otherwise produced, such are at least wholly fettered by natural laws and their abstract necessity. The living animal, on the contrary, in its freedom of motion, negatives this enforced limitation to one spot by virtue of its own activity. It is through such self-determination the continuous liberation of itself from

the material isolation. And for the same reason it is in this freedom of motion, if only in a subordinate degree, the release of itself from the former abstractness referable to the particular modes of motion, their direction and their speed. Under a yet closer view, moreover, the animal, regarded by itself in its organism, presents the same sensuous matter that is moved; and here, too, life is as before a freedom of motion within this organic reality, evidenced in the flow of blood and the movement of the limbs.

Motion, however, is not the only expression of animated life. The free tones of the voice of animals, which are unknown in the inorganic world, where bodies merely roar and clatter through the blow of objects external to them, these already present to us the higher expression of animated subjectivity. The most intimate and vital expression of such ideal activity is, however, brought before us when we find the living individual able to concentrate itself as individuality over against the objective world, while at the same time it appropriates and transfigures that world *for its own.* And this is accomplished in part through observation by means of vision, and partly for practical purposes, in so far as such an individual brings the outer world into subjection to himself, utilizes the same, assimilates it as a means of nourishment, and in this manner continually reproduces his individuality in that objective *alterum.* Such a process, of course, as it ascends through stronger organisms, assumes more and more emphatic degrees of unsatisfied desire, assimilation, satisfaction, or satiety.

Such, then, are the activities, in which the notion of animated life makes itself apparent. Moreover, the principle of Ideality thus rendered visible is not merely the result of *our* reflection; it is *objectively* real itself in the living subject, whose existence consequently we may go so far as to call an objective idealism. And it is the soul, as before stated, which, as this ideal energy, brings about its own manifestation[223], always reducing the *purely*

external reality of the body to an appearance, and thereby affirming itself as objective totality in that very bodily shape.

2. Now it is as the Idea made objectively visible to the senses that the animated life of Nature is *beautiful*; in so far, that is to say, as the truth or the Idea, presented in the form of Nature, where under it first appears, in other words life, is immediately given in the particular shape of reality adequate to it. Owing, however, to its sensuous immediacy the living beauty of Nature is neither beautiful *for itself* nor is the beauty strictly that which is *the outcome* of itself, a product, that is, of its purely objective appearance. The beauty of Nature is only beautiful for another, that is *for us*, the consciousness that apprehends its beauty. The question therefore arises in what way and by virtue of what characteristics the principle of life appears to us beautiful in its *immediate* existence.

(*a*) If we look at the practical way in which a living object becomes visible and preserves itself, the first thing which rivets our attention is *spontaneous motion.* This motion, regarded simply as motion, is nothing more than the entirely abstract freedom of motion from place to place and from time to time, which we find exemplified in the spontaneous, but entirely haphazard movements of animal life. In music and the dance we have, it is true, motion in its generic significance; but here motion is not merely a matter of chance and impulse, but it exhibits the laws which regulate it; it is defined, complete in itself and subject to measure; and it is all this, though we still abstract from it the significance whereof it is the beautiful expression. If we again interpret the motion of animals as the realization of an aim originating within themselves, this excited impulse is still entirely accidental, an end of most restricted import. If we further extend our survey and conceive such motion as the activity and working together of all parts of the animal organism towards a definite purpose, we shall merely find that such a conception is rendered possible by our own

effort of imagination[224]. The case is just the same if we reflect upon the way in which an animal gratifies its physical wants, obtains nourishment through the organs which grasp it, consume it, digest it, and generally is a subject of the process which preserves its life. For in this case also we have either only before us single desires and their spontaneous and haphazard gratification, in which the inward activity[225] of the organism is not present at all, or at least all these activities and their means of expression have become the subject of our imaginative reflection, which is at pains to understand such a process by relating it to definite ends, and to establish a harmony between aims assumed to belong to the animal itself and the organs which fulfill them.

We shall rather find that neither the sensuous perception of single haphazard appetites, arbitrary movements and efforts towards self-satisfaction, nor the fanciful consideration of the animal organism as one directed by purpose will present to us purely animal life as a part of the beauty of Nature. The beauty consists in the appearance of individual form, both in repose and motion, quite apart from the relation of its self-gratification to any purpose thus subserved, as it is apart from the entirely isolated contingency of self-imposed movement[226]. Such beauty is related to the *form* alone, because it is only as such that it is the external appearance, in which the objective idealism of the principle of life makes itself known to us as a thing perceived and contemplated upon through the senses. Thought apprehends this "objective idealism" in the medium of its notion, appropriating the same in the element of *universality* which belongs to it, albeit the contemplation of its beauty is inseparably bound with its *phenomenal reality.* And this reality is the external form of the articulated organism, which is, in our view of it, quite as much determinate particularity as it is a semblance, namely, that of the physical manifold of

the separate members, which can only form part of the concrete totality of the *living form* under the guise of phenomenal appearance.

(*b*) From the explanation of the notion of life already given we may deduce more narrowly the form of this appearance as follows. The form is one of spatial extension, limitation, and configuration, distinguished through its various shape, colour, and motion, being, in fact, a manifold of such distinctions. If, however, the organism which manifests these differences is a living organism, it will inevitably appear that the organism does not derive its true existence from such a *manifold* and its physical configurations. This is brought about by the fact that the different parts, which are apprehended by us through the senses, are at the same time conjoined together in one totality; they appear consequently as the *members* of one individual existence, which is a unity of such differences, and which not merely possesses them in their difference, but as parts of one homogeneous whole.

(*α*) In the first place, however, this unity will assert itself as the *purposeless* identity of such differences, that is to say with no abstract relation to any causal end whatever. The parts in such a case are not rendered visible to sense merely as a means to or in the service of some defined purpose, nor are they able to fix the determinate relation of form and structure which they occupy one over against the other.

(*β*) Rather the contrary is the case, for, in the *second* place, the bodily members have for our sense-perception the appearance of being quite *accidental* in their form; in other words the determination of one appears to be quite indifferent to that of another. In other words, we can never conclude because one has a certain form another will have the same, as would be the case if a material uniformity was clear between them. Where uniformity is the rule an abstract determination of some kind of form, size, or whatever it may be, is the property of all parts. The windows of a

building, for example, are all of one size, or at least are placed together in one row. Or we may illustrate the same similarity with the uniform worn by all soldiers belonging to one regiment. We have various parts of such clothing differing in colour, texture and the rest, but their formal opposition is no matter of chance; each has its causal connection with some other; it is there because the other is there. Neither is there here any complete distinction of form, nor any unique independence wholly asserted. With the individual organism of life the case is entirely otherwise. Here every part is absolutely distinguished; the nose from the forehead, the mouth from the cheek, the breast from the neck, the arms from the legs, and so on. Inasmuch as for our sense-perception every member possesses its unique form rather than one which belongs to another, or one which is determined by that of another, the members appear as self-subsistent parts, and for this reason free and spontaneous[227]. For the material juxtaposition of the parts alone throws no light upon their particular form.

(*γ*) *Thirdly*, it is obvious there must be for our imaginative perception a more inward bond of connection present in the self-subsistence of the organism, if the unity is not offered us in its rational, spatial, temporal, or quantitative relations such as are presented in the examples of uniformity referred to, which, as we have seen, the unique particularity of the parts can extinguish. This identity is not sensuous and immediately present to perception in the way the distinction between the members is presented; it is rather a secret and *inward* bond of necessity and harmonious relation between the members and their form. If it were only inward, quite out of reach of our vision, such a necessary unity would be apprehended only in thought, removed from our sense-perception altogether. In such a case, however, it would fail to enter into the beautiful object of our vision, and what we found as such in the living, object would cease to be the Idea in its own objective and phenomenal reality. Such a unity must consequently

enter into what is externally perceived, although it is, as the ideal principle of life within it, not entirely apparent to sense or confined in spatial dimensions. It appears in fact in the individual totality as the universal ideality of its members, constituting thus the fundamental basis which supports and holds them together, the subject of the living subject. And this subjective unity in organic life finds its first direct expression in feeling. In the emotional life the Soul finds its true expression as *Soul.* For soul the mere juxtaposition of limbs have no real truth, and in the presence of its subjective ideality the purely spatial multiplicity of external configuration ceases to exist. Such a manifold, with its unique differentiations, its organic articulation of parts[228] is no doubt presupposed; but when and in so far as the soul expresses itself through such in feeling the more inward unity ever-present to life asserts itself equally as the dissolution of all absolute independence between the physical parts, which reveal now not merely their *materia*, but also that wave of animation which fuses all in their soul.

(*c*) To start with, however, we must observe that the emotional expression of soul-life neither offers us the visual impression of any necessary inter-dependence between the separate members, nor indeed the perception of an identity which is necessary between such *physical* articulation and the *subjective* unity conferred on it by simple feeling. We will investigate this more narrowly.

(α) If indeed the form and only the form renders in some way visible this inward harmony and its necessity, it may be because we look upon this juxtaposition as the *habitual* relation of such members, a connection which brings to our view some specific type and the oft-repeated formal exemplifications of such a type. But the necessity of custom is after all only a *subjective necessity.*[229] According to such a principle we may find certain animals ugly for no other reason than that we find in them an organism which differs from our ordinary experience, or runs contrary to it. For this

reason we call the organisms of certain animals bizarre in so far as the way in which their organs are related together is foreign to what is more common to our experience or entirely contradicts it. Fishes whose bodies are in size out of all proportion to their length of tail, or those in which we find eyes together on one side of the head only, are an example. In the world of plants we are already prepared to find many such strange departures from type, although the cactus with its spines, and the more rectilinear shaping of its angular junctures[230] may still arouse our wonder. The more a man is educated, however, in all branches of natural history, the more able he will be to recognize in their truth the subordination of all parts of organic life, and carry in the memory the greatest variety of types in their proper classification, and the less anything he may observe will surprise him.

(β) A profounder penetration into this correlation of the parts will, however, in the *second* place, tend to give us that truer insight competent to determine from one of the parts the entire form to which it must belong. Cuvier is a famous example of such aptitude: a man of science, who by the examination of a single bone, whether fossil or otherwise, was able to specify at once by its characteristics the kind of animal to which it belonged. An excellent illustration this of *ex ungue leonem.* So from a claw or a thigh bone we may discover the conformation of the teeth, or *vice versa* from the teeth that of the hip-bone, or that of the vertebral column. Such a profound synthesis of the type and the knowledge it implies carries us, however, beyond habitual experience only. We must assume, to render it possible, previous thought and the systematic arrangement of the isolated facts of science. Our example Cuvier had no doubt secured from previous experience a determinate content and some specific quality which prevailed in each generic conception, and asserted itself as a unity of principle in all particulars however distinct, and so enabled him to recognize their affinity.

Such a specific quality is that of flesh-eating, which is then the determinating principle of the form of the other members of the organism to which it belongs. A flesh-eating animal requires teeth and jaws of exceptional vigour; when hunting it will require claws to seize its prey, mere hoofs are insufficient. Here in short is a quality which necessarily determines for us the form and principle of affinity among all the organic members. A conception of such a typical character is the ordinary one we form of the strength of an eagle or a lion. We may no doubt find something both beautiful and instructive[231] in this way of regarding the animal world, in so far as we derive from it some unified idea of its configuration, which is not a mere repetition of that unity in all the parts, but gives full value to the distinctions they possess. For all that it must be remembered the dominant factor of this survey is not the *perception of our senses*, but the generic *thought* of our minds with which it is made to conform. Reviewed in this light we ought not to say that we find the object as such *beautiful*, but rather attribute that beauty to the *reflection* of our own minds upon it. And if we examine these reflections more closely we shall find they are after all a deduction of our principle of unity from a limited aspect of the organic whole. We concentrate our attention, for example, on the mode in which it is nourished, *i.e.*, whether such an animal is carnivorous or herbivorous. Through such a limited determination we are still removed from a vision of the coalescent unity of the whole we identified with the notion, the soul itself.

(*γ*) The truth is we can only, in this sphere, bring before our consciousness the entire unity of life by means of our thought and grasp of reason. In the natural world the *soul*, in its full activity, is not found; that is to say, the subjective unity, in its pure ideality, does not exist there for a self-consciousness.

If, however, by means of thought, we endeavour to grasp the nature of soul-life according to its essential notion we shall find two aspects under which we may regard it; first, as the form subject to such a principle of animation; secondly, as the notion of soul for thought in all that the conception implies. Such a complete grasp of its true nature is not possible in the sensuous perception of the objects of beauty. Such must neither pass before us as thought, nor must we allow the interest of Thought as such to form a barrier of difference or opposition between itself and the vision revealed to us. We are left, then, with no alternative but to consider, under this point of view, the object as wholly presented to sense; we must assume that in the sphere of Nature a *sensuous* perception of the natural form is our genuine mode of contemplating the beautiful. "Sense," that is the master-key[232] to the position; a word which in itself is interpreted in two opposed senses. In the first place we may indicate thereby the organs of immediate[233] perception, secondly, by the "sense of a thing" we may refer to the significance, or the element of thought and the universal within it. In this way "Sense" is related on one side to the immediate externality of existence, and on the other to its inward or essential nature. A sensuous perception of that existence in fact preserves both sides in unity, or rather in one direction so presents the aspect that is opposed to it in the immediate sense vision as to include therein both the essence and notion of the object. But for the reason that it combines these opposed determinations in unfractured unity, the notion is not presented as such to consciousness, but is rather to be dimly foreshadowed there[234]. We accept, for example, as a determinate fact the existence of three realms of Nature, which we define as that of the mineral world, that of plants, and finally that of animals; we can conclude from this, as already foreshadowed by its truth regarded as a process rising from plane to plane, that there is an inward necessity inherent in the notional articulation of its divisions, and do not confine ourselves

only to the purely imaginative conception of it as a world conforming on its exterior side only to a final end. In the same way when confronted with the variety of the external presentment in each of these realms, the sense-perception surmises a controlling unity intelligible to mind, a progress subject to laws of thought, visible no less in the formation of mountain ranges than in the orderly succession of plant-life and of the animal races. The same tendency is presupposed when, after an examination of the form of any particular animal organism, an insect's, for example, as subdivided into head, body, abdomen, and extremities, we conclude the correlation of such parts to be based on a rational principle, and are confident that though, at first blush, it may appear quite accidental that we are in possession of five senses, we shall discover a true bond of relation between that number and the notion therein asserted. Of just this type is Goethe's method of observing and accounting for the innate reason of Nature and her phenomena. With an extraordinary intuitive sense he directed his attention directly to[235] the objects of experience, entirely convinced of the ideal bond of unity which explained their interconnection. History may be written with a like object. The narration of facts and individual lives is given in such a way as indirectly to throw a light on the essential significance which such events or persons contributed to the period in which they are necessarily bound together in one organic whole.

3. Consequently we may affirm that Nature generally, regarded as the sensuous manifestation of the concrete notion and the Idea, is to be considered an object of beauty in so far as by such a sensuous perception of natural forms some kind of foreshadowing of the notional unity consonant to them is surmised, and we are able through the channels of sense to discover not merely their form, but somewhat of the inner necessity which binds together all their parts. Further than this incomplete surmise of the notion the sensuous contemplation of Nature as beautiful is not carried. This

way of comprehending things, for which the separate parts, despite their appearance of independent freedom among themselves, nevertheless reveal to the sight the harmony that exists there either in the characteristics of *their form*, or detached portions of it or their motion and so forth, remains for all that *indefinite* and *abstract.* The inward unity is not open to external sense, nor can it appear in its ideal and concrete form to such perception[236], whether imaginative or no; such at most acquiesces generally in the universality of a law of connection inherent in every living thing.

(*a*) It is, then, in the first instance only in this bond of union which reveals itself as a necessary adjunct of vitality from the objectivity of Nature, in so far as the same is presented in forms adequate to the notion, that we have before us the beauty of Nature. With this coalescence the *materia* is wholly identical; the form is immediately at home in the matter, as its true essence and its conforming energy[237]. This description may in fact stand for us, so far as beauty at this stage is concerned, as a general definition of it. We admire, for example, the natural form of a crystal on account of the law of uniformity it manifests, a law which through no mere action of forces external to it, but by virtue of its own specific definition and free activity, free in all its aspects as itself an object, is manifested there. For although an activity external to it could as such equally be free, yet in crystals the conformative activity is not extraneous to the object; rather it is a form operative as belonging to the mineral's innate character. We may define it as the free force of its substance, which out of its own resources informs itself and is not merely passively receptive of its environment. Consequently we find here the constituent material in its realized form as a free and independent creation. In still higher and more concrete mode the immanent form projects itself through the living organism and all its parts, in the articulate form and, above all, in its motion

and its vital expression as feeling. For in this last case we have the inward vitality pregnant itself as living.

(*b*) It is moreover through this indeterminacy of the beauty of Nature, originating in its inward principle of animation that (*α*) both in virtue of the conception of life and the intuition of its true notion no less than of the habitual types conformable to its adequate presentment, we are able to distinguish between animals which are beautiful and those which are ugly. Animals incapable of vitality, such as the sloth, which creeps about with difficulty, and whose entire mode of life is suggestive of incapacity for motion or activity, offend our aesthetic sense for this very reason[238]. Activity and mobility are precisely the qualities which assert the higher ideality of life. For the same reason we condemn forms of amphibious life, certain species of fishes, crocodiles, toads, and many kinds of insects; an additional reason will influence our similar attitude to hybrid species, where confusion of form marks the passage from one determinate type to another; the ornithorhyncus is an example[239], an animal which with its mixture of bird and four-footed beast may indeed astonish us, but at the same time is repulsive to our sense of beauty. Such feelings of repulsion can no doubt be traced entirely to our habitual prepossessions which have moulded for the imagination a fixed type of animal species consonant to experience. But even so there is already actively present the intuitive surmise that the configuration of a bird, for example, is related in its parts by a necessary principle of unity, and cannot as such graft upon itself forms which belong to other species without being thereby transformed into a hybrid variety. Such abnormal deviations from type appear to us both strange and contradictory. Neither the one sided narrowness of organization, which is so defective and mean in its manifestation, that it exercises no activity over the straitened conditions of its environment, nor confusions and passages of type, which, albeit they are not so enclosed within themselves, are unable to

hold fast the distinctive features of their type, belong strictly to the sphere of natural beauty.

(*β*) There is another sense in which we attribute beauty to Nature, namely, when we have the collective picture of a landscape before us rather than observe the living form of a simple object. Here we have no organic articulation of parts such as is derived from their notion and is presented to us as such ideal unity in spontaneous life. We have instead a rich variety of objects both organic and inorganic, which are united together on one or more planes of vision in their distinctive features, contour of mountains, winding outlines of rivers, groups of trees, huts, dwellings, palaces, and cities of mankind, ships, roadways, heaven and sea, valley and rock-cleft. We find, in addition to this variety and proceeding therefrom, a delightful or imposing harmony which appeals to our sense and interests us.

It is lastly a peculiar characteristic of the beauty of Nature that it should excite or exercise a harmonious influence over our emotional life. A mood of this kind is aroused by the stillness of moonlight, the peace of a valley, through which some brook or other meanders, the sublimity of the immeasurable storm-tossed sea, the tranquil depth of the star-strewn heavens. But the significant factor in this case is not so much to be found in the objects as in the peculiar moods they arouse in our feelings and affections. On analogous grounds we attribute beauty to animals, when the expression of their life directly suggests human qualities, such as courage, strength, cunning, good nature, and the rest. Such, no doubt, in one aspect of it, truly expresses the nature of the animals themselves; but there is also our own conception of its affinity to ourselves, and the mood in which we receive it.

(*c*) However much animal life, as the culminating point of natural beauty, unfolds its freest expression as a living principle, it is comparatively narrow in its range and subject to very limited qualities. The circle of such

existence is a strait one; and in this the predominant interests are those of the satisfaction of natural instincts such as hunger and sex-attraction. Soul-life, regarded as the inward principle expressed through external figure, is poor, abstract, and empty of content. Add to this the consideration that this inward is not manifested at all as *inward.* The soul in its essential substance is not revealed by the life of Nature; it is, in fact, the determining characteristic of Nature that its soul remains shut in itself, does not, in other words, proclaim itself in its ideality. As already pointed out, the soul of an animal is not this ideal unity *self-acknowledged.* If it were otherwise we should have the manifestation of such personality brought home to others. Only in the self-conscious Ego do we find the ideal in its simplest terms, which is itself an ideal medium to itself, knows itself as this simple unity, and thereby endows itself with a reality, which is not limited to bodily and sensuous form, but is itself of an ideal character. Here, for the first time, reality is in possession of a form adequate to the notion; or rather the notion sets itself up as its own opposite, makes itself objectively real and finds its own realization in that objectivity. The animal life, on the contrary, is only *potentially* such a unity as that in which reality as bodily form is other than the ideal unity of soul. In self-consciousness we have this unity realized, whose opposing factors are constituent elements of one transparent ideality. And it is as this concrete totality of self-consciousness that the Ego is manifested to others. The forms of animal life merely enable us through imaginative perception to divine the soul's existence. Such only possess the troubled semblance of a soul, betrayed to us through the breath or exhalement which permeates the whole, gives some unity to all the members, and reveals in the entire instinctive life the first germs of an independent character. Herein lies the primary defect of the beauty of Nature, even when taken at its point of culminating form: and it is precisely this defect which will introduce us to the necessity of *the Ideal* as the beauty

of art. But before we consider at length the nature of this Ideal, there are two determinations involved as the most immediate result of this inherent defect in natural beauty, which invite our attention.

We have stated that in the animal form the soul appears as the bond of connection within the organism and the unified point of animation only under a cloud[240] and destitute of any fully realized content. We only find there a quite indeterminate and restricted mode of soul-life. We will now consider the abstract limitations of this mode more closely.

B. THE EXTERNAL BEAUTY OF ABSTRACT FORM REGARDED AS UNIFORMITY, SYMMETRY, CONFORMITY TO RULE AND HARMONY AND REALITY IN THE SENSE OF ABSTRACT UNITY OF THE PHYSICAL MATERIAL.

There is in Nature an external reality which is, of course, visible and definitely objective, but the inward unity of which, instead of presenting itself in the concrete inwardness referable to the unity of soul-life, only goes to the point of indeterminacy and abstraction. In other words, it stops short of the inwardness self-actualized in an ideal form and as the particular existence conformable to its ideal content. Its appearance is that of the defining principle on the face of external reality. Now the specific characteristics of inwardness in all its concreteness should be these. First, the principle of soul-life is asserted for itself no less than is potentially replete with content. Secondly, external reality interpenetrates this ideal arcanum, and by so doing fully reveals its true form as such external reality. A concrete unity of this nature is not reached by mere natural beauty: it lies beyond as the Ideal. On this plane of existence we cannot say that such a concrete unity enters into the manifestation of form. We have to deduce it through analysis, examining in their separation and singularity the

distinguishing features which the unity supports. The form that informs here and the sensuous external reality *fall apart* from one another; or rather we have *two* distinct aspects which we are compelled to consider separately. By virtue of this fact, which we may either regard as a division of the material of sense or as a review of certain facts taken in abstraction, the inward unity, which is one aspect of the external reality, itself falls outside it; that is to say, it is not itself asserted in that rational reality as the wholly immanent form of the entire notion which constitutes it, but rather as an Ideality and determinacy imposed externally.

Such are the points of view thus presented us which we will now consider more closely.

First, then, we have to discuss

1. THE BEAUTY OF ABSTRACT FORM

The form of natural beauty in its abstraction is a form which is determinate and thus of limited range; in a further aspect of it it is focussed in a unity of abstract relation to itself[241]. On closer inspection we shall, however, find that the external manifold controls this form of abstract beauty by reason of its own determinacy and unity. We must not, however, imply in these latter any immanent inwardness or form of vital ideality, but regard them as purely material definitions and unity of the external medium. Forms of such a character are uniformity, symmetry, or conformity to rule, and finally harmony.

(a) Uniformity

Uniformity is, speaking generally, equality in external presentment, or, more specifically, the unbroken repetition of one and the same definite form, supplied by the determining unity to the form of objects. Such a unity, in virtue of its initial abstraction, is at the furthest extreme removed from the rational totality of the concrete notion. Its beauty is therefore a beauty which is referable to the faculty of the analytical understanding. The

fundamental process of that faculty is to perceive objects in their abstraction, not in their self-determined completeness and identity. For example, among all lines the straight line is that which is most uniform, because it alone manifests one abstract and undeviating direction. For the same reason the cube is a figure dominated by regularity of content. All its sides are of the same size, the same length of line and the same angles, which, on account of their being rectangular, however much their size is changed, manifest no change in the form of their angles as is the case with angles which are obtuse or acute.

With this characteristic of uniformity we must closely connect that of *symmetry.* Form is unable long to rest in that barest abstraction of its determination, namely, undifferentiated equality. A diverse relation is sure to assert itself, breaking into the empty form of identity. In this way we obtain *symmetry*, which consists in no mere identical repetition of one form, but in a combination with some such form analogous to it, identical, that is to say, in its self-determination, and yet manifesting a distinct contrast with it. Through such a combination we obtain another kind of equality and unity, whose determination is more extensive and more varied. If, for example, on one side of a house we meet with three windows of the same size separated at equal intervals of distance, then three or four more of loftier size than the first-mentioned standing at more extended or closer intervals in relation to them, and again three more precisely similar in size and distance to our original ones, we have then before us a symmetrical arrangement. Mere uniformity and repetition of the same distinctions will never produce this result. We may find such distinguishing features in size, position, form, colour, tones, and many others like them, which, however, to produce symmetry must be harmoniously related to similar forms of construction. When we find a combination which presents to us an

arrangement of such distinguishing characteristics according to some clearly uniform principle that then is symmetry.

Both these attributes, uniformity and symmetry, being the determinations of the form and unity of external appearance, are mainly applicable to *distinctions in size.* For it stands to reason that what is expressly posited as external rather than truly immanent determination is generally a quantitative[242] determination, whereas the qualitative fixes the inherent character of anything. Consequently that which is assumed only to affect the external appearance cannot be concerned with the changes which are found in the qualitative aspect. Size, on the other hand, and its alteration regarded merely as size, is for the qualitative determination, when it is unable to assert itself in terms of measure, an indifferent determination. That is to say, measure is quantity, precisely in so far as it can give to itself an aspect which qualifies it, and thereby a qualitative determination is united to the purely quantitative one. As thus explained[243] uniformity and symmetry are merely restricted to the determinations of size and their uniform appearance or arrangement of differences in symmetrical order. Further inquiry will show us that this due co-ordination of size is as applicable to the forms of organic life as it is to those of inorganic Nature. The human organism is, for example, at least in a certain degree both uniform and symmetrical. We have two eyes, two arms, two legs, similar hip-joints, shoulder-blades, and so on. Of other portions of the body the reverse is the case. We find no conspicuous uniformity in the heart, lungs, bowels, or liver. The question arises what precisely constitutes the difference here. The side on which uniformity, whether of size, form, or position mainly asserts itself, is obviously the aspect of the organism viewed from the outside. The uniform and symmetrical determination, in complete conformity with what we should expect, is most apparent where the fact as objectively determined is itself the external envisagement itself,

and carries with it the least impression of inherent life. The reality, which is most constant to this pure externality, rests satisfied with the abstract unity congenial to it. Within the organism, on the contrary, where we find the heart of the life-process, and still more openly in the medium of untrammelled reason uniformity gives way before the subjective unity of life. Nature is, no doubt, in its opposition to mind, a determinate existence external and independent; but even in her we find that uniformity only pre-eminently asserts itself where externality is the predominant principle.

(*α*) Reviewing, then, shortly the *prominent classifications* of natural objects, we observe, in the first place, that minerals, taking the crystal for an example, as structures destitute of the principle of life, are characterized in their fundamental form by uniformity and symmetry. As already remarked, their form, it is true, is one appropriate to themselves, is not merely the determination of external forces. Through an unseen energy the form that makes them what they are as products of Nature creates their configuration both within and without. This activity, however, is not yet the completed energy of the concrete notion as an ideal principle, which directs the independent consistency of the positive reality, subsuming them under an ideal totality such as is present in animal life. The unity and definition of their form persists in purely abstract one-sidedness, and we have as the characteristics of a unity which is wholly on the outside the bare forms of uniformity and symmetry, the determinating factor in each case being an abstraction.

(β) Plant life is, of course, many degrees above the order of crystals. From the very commencement its evolution is marked by a harmonious articulation, and consumes material in a constantly active process of self-nourishment. But plant-life also is not yet really the living whole[244]. Although organically divided into parts, its activity is still one that consists wholly in assimilation[245]. It is rooted in the earth with no independent power

of motion from place to place; its growth is continuous, and such energy of assimilation and self-nourishment as it possesses is not the tranquil self-subsistence of a completely individualized organic existence, but rather a continuous extension of its growth as an external object. An animal grows just as a plant grows, but at a determinate point that growth in its external size ceases, and that which reproduces itself in self-subsistence is one and the same individual. Plant-life, however, enlarges without intermission, and only its decease renders the further increase of its boughs and leaves impossible. And, moreover, all that it separately produces in this process is for ever the repeated pattern of the same organism in its entirety. For every bough is a new plant, and not, as in the case with the animal organism, only an isolated member. On account of this persistent enlargement of itself through all the separate plant formations whereof it consists plant-life is without the subjective animation peculiar to sensation and the ideal unity which belongs to it. And, generally speaking, we may say that plant-life, however much the digestive process is an inward one, in which we find nourishment is assimilated and the organism determines the form which is impressed on its substance out of itself by virtue of the increasing freedom of the notional type working through that substance, nevertheless substantially, through the entire process of its life, it remains rooted to externality without either a true independence or unity, and such self-subsistence as it possesses is continuous without a break. And it is on account of this characteristic of plant-growth, namely, that it is for ever asserted on the side of externality, that we find uniformity and symmetry to be the fundamental unity of its self-expression as it is a predominant principle of its structure. No doubt uniformity is not so regnant here as we observed it to be in the formation of minerals, and it is not expressed in the same extreme degree through the abstract straight line and right angle: but it prevails here notwithstanding. The stem for the most part runs on a straight

line; the rings of plants of higher type form themselves in circles; leaves closely approach the configuration of crystals; and, at least as the basis of their type, we find that the blossoms themselves in the number of their leaves, their position and form are determined with uniformity and symmetry.

(*γ*) Finally, in the living organism of *animals* a difference is asserted in the reduplicated structure of the members. In the bodies of animals, more particularly if we examine the higher species, the organism is a more inward, self-contained and self-determined totality; like a sphere, it returns, so to speak, on itself, while still remaining an external organism. It is an external process, and yet, as a process, asserted against externality. The more important organs are those within, such as heart, lungs, and liver, and in these the life is bound up. Such are not determined under the simple characteristics of uniformity. In those members, however, even of the animal organism, which are fixed in direct relation to the outside world, symmetrical arrangement prevails. Among such must be reckoned the members and organs which assert the subjective principle externally no less than those which are the instruments of the active life. The sense-organs, such as sight and hearing, belong to the former; all that we see and hear is left as we found it. The organs of smell and taste already mark the point of union with an activity exercised externally. We only smell that which is already assimilated[246] by the organ of sense, and we only exercise our taste through an act of destruction. We have, it is true, but one nose, but it is subdivided into two sections, each of which is uniform in structure. The same description is applicable to the lips and teeth and other organs like them. Further than this the eyes and ears, and the limbs employed in motion from place to place, or for direct control over external objects, in other words, legs and arms, are entirely uniform in position, form, and other qualities. We find, therefore, that in the organic world no less than in the

inorganic uniformity asserts a very real predominance, qualified, however, by the fact that its presence is limited to those members which are the instruments of the organism in its direct relation to the external world. On those through which the life-process returns on itself by virtue of its own subjective principle there is no such impression of uniformity.

Such, then, are the leading characteristics of the forms of uniformity and symmetry, and the manner in which they are asserted in the configuration of natural phenomena.

(b) Conformity to Rule

We now propose to distinguish the more generic conception of conformity to law[247], so far as it appears on a higher plane of organic evolution than that already adverted to, and marks the passage of the same to the freedom of natural no less than spiritual life, from the more abstract forms discussed above. Taken by itself, no doubt, conformity to rule is not alone sufficient to give us the subjective unity and freedom of *totality*; but we do find in the configuration to which it corresponds a totality of essentially *distinguished characteristics*, such as do not merely emerge in *difference* and opposition, but betray both *unity* and determinate connection in such totality. A unity thus controlled, albeit still only positively asserted in quantitative substance, is no longer referable to essentially exterior distinctions of mere size numerically ascertainable, but already introduces to our notice a qualitative relation of consistency between these contrasted determinations. In other words we have here neither the abstract repetition of one and the same determinant[248], nor a uniform interchange of similarity and dissimilarity[249], but the contemporaneous association of aspects essentially distinct from one another. We find, in fact, our sense of sight gratified by the association of these distinguishing features in their completeness. And it is the principle of reason which affords us such satisfaction, gratifying our sense only through the totality, or rather through

the very totality of differences the nature of the fact requires. Such a connection, however, still remains an unexplained nexus, which sense-perception arrives at partly on account of its persistent repetition, and in part through an intuition of deeper source.

A few examples will make clear the process of definition from uniformity to conformity with law. Parallel lines of equal length are abstractly uniform. A further step is taken when we compare geometrical figures of the same form, triangles, for example, but assume their size to be unequal. Here the angles subtended by the corners of each and the relation of line to line is the same, but we find such similarity in different *quanta.* Take again the circle, it does not possess the uniformity of the straight line, but at the same time the determination of abstract equality strictly applies to it, for all its radii are of equal length. The circle is consequently still but a curved line that awakes no particular interest[250].

On the other hand, there is still less uniformity in the *ellipse* and the *parabola*, and they are only understood through the law of their form. In other words the *radii vectores* of the ellipse are both unequal and in conformity with rule, and the same qualification applies to the greater and lesser axis of their lines of differentiation[251]; moreover, their foci are not central as is the case with the circle. We find in these examples, therefore, a qualitative relation of difference assert itself in the law applicable to such lines and constructive of their interconnection. If, however, we divide the ellipse by means of its greater and lesser axes we obtain four equal sections; regarded as a whole, therefore, we still find the principle of uniformity paramount in this figure. Of a higher degree of freedom in its conformity to law is the *oval.* We know there is such a law, though mathematicians have been unable to express its formula. This figure is not an ellipse, but the higher curve differs from that below it. Still we find that even in this example of freer eccentricity in Nature, if we divide it through its greater

axis, we have still two equal halves. The final expression of mere uniformity in conformity to law is shown in lines, which, as in the example of the oval, when divided through the smaller[252] axis, give us unequal sections, neither section being a mere repetition of the other. The so-called undulatory line is an example of this, in the sense Hogarth describes it as the line of beauty. Thus the inclination of the arms as they fall on either side of the human body is opposed. Here we have conformity to rule without uniformity pure and simple. Such a kind of conformity especially characterises with its variety the conformation of the nobler living organisms.

Conformity to law is, then, an attribute of substantiality, binding together both its differences and its unity; but it remains still abstract on the side of its controlling form, unable to supply individuality with the freedom of motion, or rather by virtue of that form is entirely without the higher freedom of subjectivity, and quite incapable of revealing the vitality and ideality proper to it.

(c) Harmony

On a higher plane in the sphere of abstract beauty must be placed *harmony.* In harmony we find qualitative distinctions are held together, and further held together in a totality of differentiation, such as is based on the essential nature of the fact itself. This consistency of support is derived from conformity to law, in so far as that form unfolds what is essentially uniformity, and thereby passes beyond the mere characteristics of equality and repetition. But in doing this the distinctions of quality assert themselves not only in their difference of opposition and contradiction, but in aspects of a unity that rivets them together, a unity in which all distinguishing features, it is true, are maintained in their proper place, but still only as belonging to one single whole. This unity of accordance is what constitutes harmony. We may either regard it as a totality of aspects essentially distinct, or as the

resolution of the element of mere contradiction asserted by them, revealing their more vital interconnection and ideal solidarity. In this sense we refer to the harmony of form, or colour, or musical tone. As an example, we have blue, yellow, green, and red as the fundamentally necessary differentiation of colour[253].

In these irresolvable data of the spectrum we have not merely the inequality we found in symmetry, but contradictory opposites, such as yellow and blue, their neutralization and withal concrete identity. The beauty of their harmony is revealed in the avoidance of their crude opposition, which is softened thereby in such a way as to put before us the concordance hidden beneath their difference. They do, in fact, emanate from one source, namely colour, which is not an abstract conception[254], but an essential totality. So far, indeed, can the compulsive force of such totality carry us, that we can, as Goethe has pointed out, when we have but one colour presented to us, still subjectively recognize another at the same time. In the same way the tonic, mediant, and dominant are essential distinctions among musical tones, which the unity of harmony associates through their difference in one whole. We may submit the harmony of form, which is differentiated through the varied aspects of position, repose, and motion to a similar analysis. If we suffer any one of the subordinate distinctions to assume an exclusive predominance the unity which relates them will be destroyed.

Harmony, however, is not to be confused with free ideal subjectivity and soul-life. In the latter the unity manifested is not merely an interconnection and concordance, but a positive negation of difference, which, for the first time, reveals their concrete and ideal unity. A concrete unity such as this is not the result of harmony. Such concrete unity is, for example, that which we find in the actually melodious thing[255], which no doubt possesses harmony as its fundamental form, but at the same time possesses the higher

characteristic of free subjectivity, and by means of song gives expression to that. Harmony alone has nothing to do with the appearance of subjective life, as such, nor of that of mind, although it is the highest manifestation of abstract form, and stands in close affinity to free subjectivity. Such, then, is our determination of abstract unity as we find it brought before us in the specific modes of abstract form.

2. BEAUTY AS ABSTRACT UNITY OF THE MATERIAL MEDIUM

The side of abstract unity which we have now to consider is not that directly related to form, but to the sensuous material simply in which it is asserted. The unity is manifested on this side as the entirely undifferentiated concordance of the particular sensuous material. It is the one form of unity, which the material of sense, in its purely objective aspect, is capable of receiving. On this plane and under the above noted relation[256] the abstract *purity* of the *materia* in its form, colour, or tone constitutes what is most essential to it. Entirely straight drawn lines, which run without a shadow of difference in their straightness or strength, bare superficies and similar examples please us by virtue of their persistent regularity and their uniform homogeneousness. The purity of the heavens, the translucence of the atmosphere, a mirror-like lake the smoothness of the ocean's face, all give pleasure by virtue of this unity. We find the same truth brought home to us by purity of tone. The voice when purely produced, though taken quite by itself, possesses an attraction for us inexpressibly delightful; vocal notes which are not thus pure on the contrary, by permitting us to hear the organ of production along with them, disturb or weaken the pure resonance and definition of their music. In much the same way human speech possesses pure tones in its vowels, a, e, i, o, u, and its compound vowels, ae, ü, and ö. Popular dialects are particularly characterized by impurity of vocalization and mediate tones such as oa. Purity of tones consists further in this that the vowels are associated with consonants, whose sound does not tend to blurr

the sonority of the vowel tones, as is too frequently the case with our northern languages, when contrasted with the way in which their purity is preserved by the Italian, a characteristic which makes that language so adaptable to singing. We experience an enjoyment of similar nature through the sight of colour in its simplest purity of tint, an absolutely pure red or blue for example, not by any means a common occurrence, such pristine colours being often weakened through the addition to them of yellow or tints of each other[257]. Violet can no doubt appear to us as a pure colour, but only in an external object, not, that is to say, as a compounded colour[258], for it is not itself an elementary colour belonging to colour's essential differentiation. It is these elementary or cardinal colours, easily recognized by sense in their purity, which, on account of their crude opposition, are most difficult to unite together in harmony. Colours, on the contrary, which are blurred in their transparency by many other tints, although not so antagonistic to general harmony, fail to give us such direct enjoyment from the very fact that the energy of opposition in them is weakened. Green, for instance, is a compound of blue and yellow, but it is the neutralization of these cardinal colours, and for that reason less attractive to us in its own purity than blue and yellow in their secure[259] opposition. Such are the points of most importance we have to remark upon in dealing with the abstract unity of form no less than the simplicity and purity of the sensuous material. In whichever aspect we regard our subject-matter we have to review that which is by virtue of its abstract character destitute of life, and a unity with no true actuality. Ideal subjectivity is inseparable from this, and such is entirely absent from the beauty of Nature even at the highest potency of its manifestation. This essential defect points us imperatively forward to the Ideal, which Nature is unable to reveal to us, and in contrast with which the beauty of Nature appears as a subordinate mode.

C. DEFECTIVE ASPECTS OF THE BEAUTY OF NATURE

The true object of our inquiry is the beauty of art viewed as the only reality adequate to the Idea of beauty. We have hitherto treated the beauty of Nature as the first mode of the existence of the beautiful. We have now to inquire more closely into that which distinguishes natural beauty from that of art.

As an abstract proposition we may affirm that the Ideal is beauty in its rounded completeness. Nature, on the contrary, brings before us beauty in its incompleteness. Such abstract predicates do not, however, help us much, for our real problem is rather to explain exactly what it is which makes the difference between the completeness of the one from the incompleteness of the other. Our inquiry therefore hinges on the question how it comes about that Nature is necessarily incomplete as a mode of beauty and how this incompleteness is asserted. When we have answered that we shall be in a better position to deduce both the necessity and essential significance of the Ideal.

We have already in following the process of Nature up to its culminating manifestation in animal life drawn attention to the modes of beauty revealed in that process. It is now of the first importance that we fix our attention more definitely on the culminating phase of that evolution where we find subjectivity and individuality presented to us in the living organism.

We have already referred to the beautiful as the Idea in a manner identical to that we employ when we speak of the good and true as the Idea, in the sense, that is to say, where we characterize the Idea as the wholly substantial and universal, the absolute substance — with no sensuous material therewith — of reality, in short, the consistency of the world. Determined more strictly, however, as already pointed out, the Idea is not merely substantiality and *universality*, but the unity of the *notion* and its *reality*, just that, the notion revealed to us as notion in its coincident objectivity. It was Plato who, as we have remarked in our introduction,

posited the Idea as that which was alone true and universal, and, indeed, as the one *concrete* Universal. The Platonic *Idea* is, however, not itself as yet the concrete *real*, for apprehended under the *notion* and its *universality* it is already coincident with the real. Apprehended, however, only in its *universality*[260], it is not *realized*, realized, that is to say, as Truth in its self-determinate realization. It is still only the *potency* of such self-realization. But just as the notion is not the notion of real existence without its full objectivity, in the same way the Idea without its realization in the objective world is not the Idea in its Truth as existent reality. The Idea must proceed to such realization, which is only present itself for the first time in a really existent subjectivity adequate to the notion, and its ideal unity and self-determination. In the generic species we find its reality first manifested as free and concrete individuality. Life only exists as a *living thing*; goodness is only realized in *particular* men; and all truth is simply the consciousness of *knowledge* — Spirit which has come to its own vital inheritance. Only the concrete singularity is both true and really existent, mere abstract universality and particularity is not so. This self-subsistent actuality, this subjectivity is the point on which everything turns, and which we must fully grasp in its significance. Subjectivity may be defined as ideal determination by virtue of a principle of ideal unity which asserts itself through *negation* of the differences presented to it as consistent parts of one objective reality[261]. The unity of the Idea and its realization is the *negative* unity of the *Idea* as such and its *reality*; it is at once and at the same time the *subsumption* and *deposition* in a unified content of the difference asserted on either side. Only in this active process is the unity of the Idea affirmatively determined in its full activity, a unity and subjectivity whose process of self-determination is infinite. We have consequently to apprehend the Idea of the beautiful in its realized mode of existence as essentially concrete subjectivity and, moreover, as individual substantiality,

by virtue of which it is the Idea really existent, possessing the form of its reality in concrete and individual singularity.

But here we must distinguish between *two* distinct modes of singularity or individuality, namely, that which is immediately presented us by *Nature* and that which is predicated of *mind* (spirit). In both forms it is given determinate existence, and consequently is in both substantive content, the Idea in short, and in the particular sphere of our inquiry for both forms the Idea as beauty. Viewed in this way we may affirm if we please that the beautiful of Nature has a *similar* content with that of the Ideal. In contradistinction, however, to such a point of view we must not fail to observe that the difference of form, in which the Idea herein attains reality, that is to say the difference between the individuality which prevails in the spheres of Nature and Spirit, the difference asserted in its respective appearance, this it is which constitutes an *essential distinction.* As we shall see, the real point of our inquiry is this, namely, which of these two forms is really the one most adequate to the Idea, for it is obvious that it is only in the entirely adequate form that the totality of the Idea is *in its full content* explicitly realized. This is the more immediate point we have now to examine in so far as the difference between natural beauty and the Ideal falls into line with the formal differentiation of singularity.

Immediate singularity is no doubt primarily found in the domain of Spirit no less than in Nature as such. For, in the first place, Spirit is possessed of an external existence in bodily form; secondly, even in spiritual relations, Spirit, in the first instance, only exists in its union with immediate reality. Subdividing our inquiry in conformity with such facts, we will consider the nature of immediate singularity from *three* different points of view.

1. (*a*) We have already seen that the animal organism preserves its determinate existence through a persistent evolutionary process of its own

in opposition to an environing inorganic Nature, which it assimilates by means of consumption and digestion, compelling thereby what is external to submit to that process, and asserting its own independent existence by so doing. We found at the same time that this living process is a system of activities, which is realized in a system of organs, whose functional action consists in those very activities. The one and single aim of this homogeneous system is the self-preservation of the living totality thereof through such a process. The animal life consists, therefore, in a life of sensuous impulses, whose general course and satisfaction is realized in the above-mentioned organic system. The living organism is for this reason articulated in its parts under a *teleological principle*, and the principle or end subserved is self-preservation. Life is immanent in every member; they are united to life, and life is one with them. And the net result of this animate process is that the animal is maintained as a thing conscious of itself as an individual subject of feeling, life and the self-enjoyment its singularity procures for it. We have only to compare animal life with plant life to see the difference implied in the absence of such a sense-consciousness. The plant simply brings to the birth new specimens of its species, without even being able to concentrate any single one on that point of negation, which constitutes self-singularity. We must, however, add that even in the animal organism and its life we never have actually before our eyes the true manifestation of this *centre of unity*, but rather simply the *manifold* of its members. Life is still too deficient on the side of freedom and in opposition to the mere caprice of sense-life to manifest such a subjective individuality as is capable of breaking through the external envisagement of its organic parts. The vital centre of such activities in the animal organism still remains veiled from vision, and all that we see are the mere outlines of the figure, and this for the most part concealed from our view by feathers, scales, hair, fur, or spines. There can be no question that

coverings of this nature, though characteristic of the animal world, are coverings which partake of the form of the vegetable world. And it is precisely at this point that the beauty of animal life declares its essential insufficiency. That which the organism makes most visible to us is not the soul-principle. That which is directed outward and throughout appears is not the life within, but rather formations accepted from a lower plane of existence than the essential embodiment of life. The animal is *only* fully alive beneath that outer crust, and consequently for this very reason that its *inwardness*[262] is not wholly made real in a form adequate to reveal it, we are unable to see the principle of Life everywhere shine freely through it; it remains *only* an *inwardness*, and the shell is *external only* unpermeated by the vital principle.

(*b*) The *human* body, in virtue of its more exalted station, presents us with a striking contrast. In this we are everywhere reminded that man is in possession of a unity of feeling, a soul. The human skin is not covered over plant-like with an apparently lifeless sheath; the pulsation of the blood is visible throughout the entire surface; the beating heart of life is everywhere at the same time apparent; and we have in this outward manifestation, as it were, the real fount Of life made visible, the *turgor vitae* as it streams from its centre. In the same way the human skin, sensitive throughout in its minutest parts, reveals to us the *morbidezza* of its colouring, those tints of flesh-colour and vein-colour which are the despair of an artist. On the other hand, however much the human body presents, as the apparent mirror of Life, a contrast with that of animals, it undoubtedly expresses also the natural process of self-preservation in the subdivision of the skin, and the indentations, wrinkles, pores, small hairs and veins which we find attach thereto. In fact the skin itself, though permitting the inner life to shine through it, is none the less an external protection of that life, a means obviously intended for such self-preservation. The supreme significance,

however, of the contrast here presented is traceable in this extraordinary sensitiveness of the human cuticle, which, although not absolutely the seat of feeling itself, alone renders such feeling possible. But at the same time even in this direction we are made conscious of the defect, that this sensitiveness does not penetrate as a vital impulse of concentrated emphasis equally through all the members. We find in the human body itself certain organs whose form is entirely appropriate to mere animal functions, while others give a more adequate expression to the entire soul-life, its feelings and passions. Regarded in this way it is obvious that even in the human body the inner life of soul has not found its complete reflection in all parts of its external realization.

(*c*) The same defect is apparent on the higher plane of the *spiritual* world and its organizations, if we consider such under the aspect of life as immediately presented. The more extensive and the richer their configurations are, the more we shall find that the fundamental object of the inner life of such totalities requires other means co-operative with such externality for its adequate expression. Such organizations no doubt appear in immediate reality as organic wholes in which definite purpose is realized, and the realization of such purpose is manifested by the mediation of voluntary effort. Every centre of such a spiritual organism, such as the State or the family, that is to say each individual organic totality, is in possession of a *will* capable of such exercise, and appears in unity with the other members of the same organism; but the *one* inner soul of this nexus, the freedom and reason of the aim of all is not visible in external reality as such in the absolute freedom of its subjective and universal principle of life, nor is it thus manifested in every part.

The same thing may be observed in particular actions and events, where we find a similar organic totality present. The inner motive from which they proceed is not wholly made visible upon the external surface of their actual

presence. What we do find is a total presentment of *fact*, whose most fundamental ground of unity and vitality still remains *hidden from sight.*

Finally, when we consider from the same point of view any single individual we are confronted with the same truth. Every human person is a self-rounded totality, held together by the central unity of life. In the immediate envisagement of reality, that is in his life, action, avoidance of action, desires and impulses, he only appears in a fragmentary way; none the less it is only from a general survey of all his actions or sufferings that we are able to form an estimate of character. The centre of unity which thus concentrates to a point the entire subject-matter of our extended survey is not as such either visible or directly apprehended.

2. The second point of importance to which we would draw attention is this. With the immediate appearance of individuality the Idea, as we have already indicated, receives determinate existence. Through this very immediacy however it becomes interwoven with the complexity of the external world, is conditioned by the limitations of external circumstance and the relative character of means and ends which are found there, in one word is carried into the finitude of external Nature. For though immediate singularity is in the first place a fully rounded off unity, it is for the same reason only self-exclusive as a centre of negation opposed to *others*, and is, by virtue of its immediate singularity, influenced by, no less than related to, a totality of real existence other than its own, upon which it is dependent in a thousand different ways. The Idea, in short, is in this very immediacy realized in every direction as *individual distinction.* It is consequently now merely a reflex of the inherent energy of the notion which binds all individual existence, that of Nature no less than mind in reciprocal correlation[263]. Such a relation to the existences themselves is a purely external one, and appears also to them as a single *external necessity* uniting each part of the manifold in one shifting complexus of interrelated

reciprocity. The immediacy of determinate existence is therefore, as thus regarded, a system of necessary relations between apparently self-subsistent individual things and forces, in which each singular entity is committed as a means to the service of ends foreign to it, or itself is compelled to utilize that which is external to itself as such a means. And inasmuch as the Idea is under this aspect wholly realized on the ground of externality, there appears at the same time the unrestrained play of every caprice and accident, no less than the uncontrolled discharge of the burden of indigence. Singularity as immediate appearance lives and moves in the realm of unfreedom.

(*a*) The individual *animal* is, for example, fettered wholly within the bounds of its natural environment of air, water and land. Its entire way of living, the mode of its self-nourishment, everything that concerns it, is thereby determined. It is this which differentiates with such variety the species of animal life. We find, moreover, intermediate strains, such as swimming birds and suckling animals, which live in the water, amphibious species and others which still further mediate between the more obviously generic. These are, however, mere confusions of race, and indicate no higher mediation of considerable range. Throughout we find the animal subject in its self-preservation to the absolute necessities of external nature, cold, drought, or insufficient supply of the means of nourishment. Under this despotic dominion it is liable through the parsimony of circumstance to lose the fulness of external form, the blossom of its beauty, in short to become as it were the reflex of starving Nature herself. External conditions fix imperatively the measure of beauty it either preserves or forfeits.

(*b*) The human organism, in its particular bodily existence is subject, if not in the same measure, to external forces of Nature, and is compelled to face the same contingencies, deficient livelihoods, and every kind of harassing disease and misery.

(*c*) If we carry investigation further to that still higher plane of immediate reality where *spiritual* interests are predominant we shall find this dependence on external condition for the first time emphasized in its full relativity. Here we are face to face with the prose of human existence in its entire length and breadth. The contrast already noticed between ends subservient to purely physical wants, and those profounder aims of spiritual life, and the conflict which tends to inflict a loss on one side or the other, already opens our view of it. Add to this every individual man, in order to preserve himself as such, is compelled to make himself in many ways subservient to others, and the limited aims of others, and on the other hand, in order to satisfy his own narrow interests, to accept the service of others as a mere means for their fulfilment. The individual, then, as he appears in the prose-life of everyday existence, is not therefore active out of his own particular totality, nor is he intelligible so much in virtue of himself as in virtue of that which he is not[264]. For individual man stands in a relation of dependence to the influences, laws, organizations and other social relations of civic life which he finds already existing around him, and to which he must submit whether he forfeit his own independent soul-life thereby or not. And more than this, each separate individual is not presented to others as such totality, but is only reflected in whatever isolated interest they may happen at the time to possess in his actions, desires, and opinions. And what interests mankind mainly is some relation to their own particular thoughts and aims. Even historically important actions and events, with which the community is expressly associated, appear in this field of relative appearances merely as a manifold of isolated efforts. It is a varied collection to which each contributes as he may, with aims by no means identical, some of which meet with success while others miscarry, and indeed, be they ever so fortunate, are significant in a very subordinate degree if we consider them as contributions to the wellbeing of all. What the majority may carry

through, in contrast with the entire aggregate of events and the end applicable to all[265], to which it furnishes its quota, is after all a mere patch; nay, even men of eminent standing, who feel and are fully conscious of the universal passage of events[266], as their own world, are for all that clearly immeshed in the same net of particular circumstances, conditions, and a thousand other hindrances involved in their relative position. On all these grounds it is plain that in this sphere of exterior life the individual world is unable to offer us the vision of that independent and complete freedom of the living principle, such as is essential to the true notion of beauty. It is, of course, true that the immediate appearance of human reality and its events and organizations is not without system, and as such is a totality of activities; but this whole is rather in its appearance a mere mass of isolated fragments. Moreover the practical concerns of such activities are divided and subdivided into countless parts, and in such a way that each single part is in touch with the merest fraction of all; and, in short, however much individuals may remain steadfast to their own purposes, and only bring forth to the light that which their own interest has employed as a means, the self-subsistence and freedom of their will remains more or less of a formal character, determined by external circumstance or accident, and constantly thwarted by natural causes[267].

This is the prose of the world, as presented to our own consciousness no less than to that of others; a world of finitude and change, a world immeshed in relation and submerged beneath the pressure of necessity, a world from which no individual can extricate himself. The central paradox of life confronts every unit of the living whole. On the one hand there is the impulse of individuality to perfect its isolated unity in self-exclusion; on the other there is the necessary condition of dependence on others from which none may claim immunity. However prolonged the struggle to overcome

this contradiction may be the effort of that interminable battle only terminates with life itself.

3. Thirdly, the immediate singularity of the worlds of Nature and Mind is not merely conditioned by dependence on others, but is deficient in any complete self-subsistency owing to its *confined* nature, or with more accuracy, because it is particularized in its own specific mode of manifestation.

(*a*) We will explain our meaning further. Every single specimen of life in the animal world is from the first fettered by a definite, that is to say, a restricted and constant species, beyond the limits of which it cannot pass. There is in the spiritual world, no doubt, a general picture of life and its organization, which floats vaguely before our vision; but in the real world, which is one with Nature, this universal organism breaks up into a multitude of particulars, each of which possesses the determinate type of form and grade of cultivation in which it is related to a definite portion of the social organism. In addition to this and within these insuperable limits, we find the pressure of that element of contingency, as regards general condition or external environment, predominantly asserted both uniquely and in haphazard fashion throughout every one of those individual units. Such a state of things disturbs our vision of the self-subsistency and freedom, which the idea of true beauty imperatively requires.

(*b*) As already observed, it is unquestionably true that Spirit discovers in its own bodily organism the notion of life completely realized. This is so much the case that, in contrast with it, the forms of the animal world appear not only as incomplete, but in inferior species as even pitiable objects. The human organism is also, however, broken up, if to a less, degree, in racial subdivisions and the ascending grades of beauty which distinguish such races. Moreover, in addition to this obviously very general line of demarcation, we have presented to us all the accidental variety of qualities,

peculiar to distinct families and their interfusion with one another, such as modes of life, facial expression, and general demeanour. We must further associate with such characteristic traits, which all of them emphasize a condition of essentially unfree particularity, those peculiarities which are inseparable from activity employed in the endless round of commercial life or professional career; qualities which find their ultimate expression in the specific habits or idiosyncracies of any exceptionally marked character or temperament, or, as the reverse side of the picture, in the various confusions of arrested development. Poverty, care, anger, coldness, and indifference, the rage of passion, the obstinate retention of narrow purposes, indications of change and division in the spiritual world, entire dependence on that of Nature — in one word all that is implied in the transitory condition of human life — leaves its indelible, if quite incalculable, expression on the varied surface of the faces of mankind. Who has not crossed weather-beaten types of such, on which the storm of all the passions has imprinted its disturbing wave; or others, where the coldness and superficiality of the soul within is all the impression we receive; or, lastly, as the final verdict of self-absorbed particularity[268], cases in which the general type seems almost totally to have disappeared. There is no end to the caprice of the human features. Speaking generally, we would associate with this ground the fact that the beauty of children most arrests us. In their faces we find all pronounced idiosyncracies slumber as it were beneath a quiet veil; no dominating passion as yet ravages their soul; not one of the thousand interests of the grown man has engraved for ever the expression of its necessity on these mobile features. This envisaged innocence of the child, however, though we may discover in its flexible animation the possibility of Life's completed fulness, obviously fails to reveal those profounder indications of a spirit which has been carried forward to explore the range of its own recesses and to make its life one with rational purpose.

We may regard, then, immediate existence, both in the purely physical and spiritual sense of the term, as a *finitude*, or more justly as a finitude which does not satisfy its notion and for this very reason declares its finitude. For the notion, and more concretely still, the Idea, is essentially *independent* and *free.* Purely animal life, although as Life it is the Idea, is no manifestation of infinity as such or freedom. This is alone possible under conditions, where we find the notion penetrate so completely the reality which is adequate to it, that it finds itself entirely at home therein, with no extraneous matter, to disturb its possession. Then alone do we find it a really free and concrete individuality. The natural life, on the contrary, is unable to overcome the element of feeling to which it is attached, and which renders it incapable of penetrating the entire reality which enrings it. It finds itself, moreover, immediately conditioned in itself, restricted in its range and dependent, a result which is due to the fact that its freedom is not truly self-determinate, but conditioned by the external: object. And the same thing is true of the immediate and finite reality of the spirit world in its knowledge, volitional action, and fateful history. For although in this latter case we find centres of unity expressed which have a real significance, neither these any more than the particularities they unite have truth as they stand by themselves; but only that truth which, in their reciprocal relation to each other, they manifest as constituent parts of a whole. And this whole, albeit in a sense adequate to its notion, does not correspond to it in such a way as to manifest itself in its full totality[269], which consequently still remains aloof from such envisagement, or rather, is only apprehended in the ideal world of thought. In other words, the notion finds no fully adequate presentation in external reality, such as is powerful enough to marshal homogeneously all the numberless fragments of particularity, and to concentrate them into *one* expression and *one* single form.

(*c*) This, then, is the fundamental reason which prevents Spirit itself, on the finite planes of determinate existence, and under the restricting conditions of its externality and necessity, from rediscovering the immediate vision and enjoyment of its freedom. It is consequently driven by its absence to seek that vision in a higher sphere. That sphere is art, and its realization is the Ideal.

We have thus seen that it is the defects of immediate reality which drive us forward inevitably to the idea of the beauty of art. We are further under an obligation to prove that its fundamental object[270] is to manifest here on this very plane of rational reality and in its freedom the envisagement of life, and, most important of all, the life of Spirit. Here, then, we have at last the external revealed to us in a form adequate to the notion. Here, for the first time, truth is lifted up from its environment of temporal conditions, from its running to and fro among the whirl of finite particularity, and attains repose; nay, more than this, discovers an external form, from which the hunger of Nature and the prose of life no longer stare at us. Here at last we have a form worthy of substantial truth, which is wholly self-contained and self-dependent, determining with freedom its own content, and not driven from such self-assertion by the weight of that of others.

[201] *Als Beseelung sich kund gäbe.* The reference is to the second class which follows rather than truly animates life. The sun is such an animating principle. How far modern physics with its investigations of the laws of motion that obtain among the chemical atoms of any specific form of matter and its denial of all dead matter would have modified Hegel's view is an interesting question.

[202] *Wir wollen betrachten.* Hegel seems to be conscious himself that there is something fanciful in this interpretation of the significance of what is simply an arbitrary, if systematic, arrangement of bodies according to natural laws.

[203] *Ein besonderes Moment.* I think what Hegel means here is that every body as a vehicle of light reflects the mode in which the identity of the notion as system in the different parts asserts itself.

[204] In other words what should be phasal elements (*Momente*) of a whole integrated within that unity remain independent units. They are not Momente in the full sense.

[205] *Als bloss real unterschiedener.* The meaning is that the distinction is only in the totality, not as in the former case in a body which though part of a system, could be viewed as an independent body like the sun.

[206] *Gewöhnliches Bewustseyn*, *i.e.*, the ordinary view of understanding (*Verstand*) and sense-perception.

[207] *Blosser Zusammenhang.* Fortuitous is rather too strong. He means a bond of union cemented by one principle without which either side fails to possess its specific character, *e.g.*, the human body apart from the human soul its animate individuality, ceases to be human.

[208] *Als Begriff seyende Begriff.* The reference I take to be to the logical or dialectical movement of the Idea.

[209] *Viele tausend empfindende*, or centres of feeling.

[210] *Die realen Unterschiede*, *i. e.*, the distinctions of the body viewed as part of the physical process of Nature.

[211] *Zu ihrer subjektiven Einheit*, that is to say, their unity with the notion of Life as objectively realized in Nature, subjective only in the sense that it is ideal, not apprehended by sense-perception as such.

[212] *Nähere.* I think Hegel uses *nähe* in the idiomatic sense in which he uses it in the phrase (p. 150) when he speaks of Nature as *das nächst Daseyn der Idee*, *i.e.*, most elementary, more near to it when the notion first presses out of abstraction into totality.

[213] Lötze apparently disputes this distinction, but it appears to me very clear.

[214] *Seyn.* The logical terms are here employed in their technical Hegelian sense. *Seyn* is “being” as part of a process, it is rather a tendency to become than a particular or determinate being (*daseyn.*)

[215] *Das Negiren*, the negation of them as entirely independent structures.

[216] *Des Idealisirens*, *e.g.*, the principle of ideality which is in one aspect of it negation.

[217] *Affirmatives Fürsichseyn*, *e.g.*, the explicit ideal totality of Life apart from the process.

[218] *Bilderin.*

[219] *Das Innere*, otherwise called subjective (see note above) and meaning what is not externally visible as *materia*, though it may be visible indirectly as explained further on.

[220] The rather difficult German here is: *Da nun aber in der Objektivität der Begriff als Begriff die sich auf sich beziehende in ihrer Realität für sich seyende Subjektivität ist.* The comma after *Begriff* is clearly a misprint.

[221] The words here are *das subjektive Fürsichseyn*, *i.e.*, the self-conclusion of an explicit whole in virtue of a principle of ideal unity (*i.e.*, life) asserted, throughout.

[222] *Ein Beharrendes*,> one that persists in an inert form.

[223] Hegel uses the word *scheinen* both for the ideal manifestation of the Idea in the object and the appearance of material reality reduced by it to mere "show" (*herabgesetzt zum scheinen*), *i.e.*, deprived of its independent reality. This introduces a slight confusion I have endeavoured to avoid by using different terms.

[224] *Unseres Verstandes.* We supply the notion of intelligent purpose.

[225] That is, the assumed subordination of all organs to one definite end.

[226] *Sichbewegens.* The emphasis is of course on the self. But even then the statement is rather an excess. For it seems difficult to attribute all the beauty visible in the spontaneous movements of so many living creatures, notably that of birds, to their purely formal character. At least there is something given by such motion analogous to the impression we receive from music and the dance; they are *gesetzmässig* in short.

[227] *Zufällig* — capricious as opposed to a uniform principle. There is, however, one apparent bond of external similarity, between the majority of such members, namely, their covering of skin; this not merely relates the cheek to the neck, for example, but to some extent destroys the distinction.

[228] Physical parts, that is to say.

[229] That is to say, it is based on a purely limited experience which does not necessarily concern the true nature of the objects perceived.

[230] *Stangen.* The word may express the branches on which the flowers are carried or the stamens they carry at their apex.

[231] *Geistreich*, "intelligent," *i.e.*, an ingenious way of regarding such facts.

[232] *Dies wunderbare Wort.*

[233] The use of the word *Sinn* to which Hegel here alludes is not quite identical with our word *Sense.* In the English use of the term there is more stress on the *materia* presented to sense-perception and perhaps less reference to intellect when the word is employed in such an expression as "That man has sense." However, Milton has "What surmounts the reach of human sense," and no doubt both are employed very similarly in many writers.

[234] *Bleibt bei der Ahnung.*

[235] *Naiver Weise*, a common epithet of Hegel to denote freedom from all philosophical prepossessions, a frank and simple attitude of reception.

[236] *Betrachtung* appears to imply in its contrast with *Anschauung* the presence of that intuitive sense or imaginative co-ordination above discussed.

[237] *Gestaltende Macht*, *i.e.*, plastic force.

[238] This account of the criterium to be adopted in determining beauty in the animal creation is open to some criticism. Mobility is no doubt one element of beauty, but it is only one. Professor Bosanquet points out in his criticism of the passage ("Hist, of Aesthetik," p. 338) that it amounts to the assertion that ugliness is purely relative. The defect is not only due, it seems to me, to Hegel's insufficient regard for Nature as a modern painter would so regard it, but it may be traced also to his manifest preference for motion in all the manifestations of Nature.

[239] *Schnabelthier*, otherwise called the *duck-billed platyptis*, a mammal found in Australia, much the size of an otter, with the horny beak of a duck and paws formed for swimming.

[240] *Getrübt*, we have the word *trüben* above, translated there "troubled," life merely seen through the thick veil of instinctive sense.

[241] That is, the unity manifested is as abstract from all concrete totality as the form itself.

[242] This shows clearly that symmetry is only in an analogous way applicable to musical tones.

[243] In other words, uniformity is outside the purely qualitative relation, whereas symmetry is not so.

[244] *Beseelte Lebendigkeit*, lit., the insouled life-principle.

[245] Lit., “Is continually thrust out into the external.” Its activity as life is directed outward.

[246] *Was schon im Sichverzehren begriffen ist.* I think the distinction implied is that in smell we are in actual contact with a part of the object. The same thing would, however, be true of sight according to former theory exploded by Newton’s hypothesis.

[247] *Gesetzmässigkeit.* I cannot think of an English word that quite reproduces it. I am not sure that either conformity to rule or law singly quite expresses it. It implies both.

[248] As in uniformity.

[249] As in symmetry.

[250] That is to say, apart from symbolical meaning, it possesses no hidden law to be discovered in the relation of part to part.

[251] The words are *die grosse und kleine Axe von wesentlichem Unterschiede.* These refer primarily, it appears, to the axes of an ellipse, but the expression may possibly include the axes of a parabola parallel to the sides of a cone. However I admit frankly I find the words *von wesentlichem Unterschiede* difficult to interpret closely.

[252] In the text *grossen*, obviously a misprint.

[253] The incorrectness of this statement according to more recent analysis does not, of course, affect the argument.

[254] *Nicht einseitig.* I think the meaning here is that colour is not an abstract idea for independent qualities, but is the generic notion of a really existing totality.

[255] *Alles melodische*, primarily, organic, of course.

[256] Namely, that of abstract unity.

[257] Hegel expresses this rather differently by saying that they tend to pass over into pink (*röthliche*) or orange (*gelbliche*) and green. I have put the same statement rather more directly.

[258] I think this is the meaning of the words *aber nur äusserlich, d.h.*, *nicht beschmützt.* Violet, however, is now regarded as a cardinal colour. It may also be doubted whether the difficulty of harmonizing pure colour is as Hegel states it.

[259] This of course is a very questionable position from the point of view of aesthetic taste no less than the conformity of our sight to natural objects. The obvious retort is, it all depends what the nature of the green is. Why is there such a preponderance of green in Nature as we find it?

[260] That is to say, under the Platonic view of universal.

[261] So I have interpreted the words, *Die Subjectivität nun aber liegt in der Negativen Einheit als Ideellsetzen der Unterschiede und ihres realen Bestehens.*

[262] *Das Insichseyn*, *i.e.*, the incipient singularity of a feeling subject.

[263] I have translated the words *bleibt nur die innre Macht* "merely a *reflex* of the inherent energy," etc. I do not pretend thereby to clear up all the difficulties of this paragraph. I would rather remind the general reader that in this entire discussion of the principle of individuality and its modes of real existence we are face to face with one the fundamental difficulties of the Hegelian philosophy, the passage of the Idea to Nature. Readers who wish to see difficulties more fully developed on this aspect of Hegel's thought should read Professor Seth's interesting and on the whole moderately worded criticism contained in his little book "Hegelianism and Personality" (Blackwood and Sons; see particularly Lecture IV, Thought and Reality).

[264] *Aus Anderem*, *e.g.*, the not-self of experience.

[265] *Des totalen Zwecks*.

[266] I think the expression *das Ganze der Sache* means this rather than the entire "organic whole of living reality."

[267] It is well for the general reader to remember that we have here no full account of what constitutes the *content* of a free will. The emphasis throughout is on human activity as exercised in a world

conditioned in its external aspect by necessary laws of Nature.

[268] The reference here must I think he mainly, perhaps wholly, to the distorted face of the criminal, outcast, or insane classes. But it is just possible that a certain type of aggressive genius may also be denoted.

[269] The totality of the notion.

[270] *Beruf*, *i.e.*, that which it professes to do.

CHAPTER III

THE BEAUTY OF ART, OR THE IDEAL

IN OUR CONSIDERATION of the beauty of art we will confine our attention to three fundamental points of view:

First, the Ideal in its essential import.

Secondly, the determination of the Ideal in a particular work of art.

Thirdly, the creative subjectivity of the artist.

A. THE IDEAL SIMPLY, OR AS SUCH

1. The most general conclusion which may be gathered from the examination we have already made in a merely formal way of the Ideal of art may be thus summarized. Truth, in its unravelment as external reality, is only fully in possession of a true and determinate existence, however much it may combine and retain in embracing unity a manifold content, in so far as every portion of the content thus unfolded permits this unity, which may be called either the animating soul or the unified totality, freely to appear. To take the human form once more under review as the most direct illustration of this, we have already remarked that it is a totality of organic members each of which is penetrated by the notion, differentiated thus in every particular organ by some particular mode of activity and the specific motion congenial to it. If we ask ourselves now in which particular organ the soul appears as such in its entirety we shall at once point to the eye. For in the eye the soul concentrates itself; it not merely uses the eye as its instrument, but is itself therein manifest. We have, however, already stated, when referring to the external covering of the human body, that in contrast

with the bodies of animals, the heart of life pulses through and throughout it. And in much the same sense it can be asserted of art that it has to convert every point of the external appearance into the direct testimony of the human eye, which is the source of soul-life, and reveals Spirit. Take the famous adjuration of Plato to the stars in the lines:

When thou gazest forth at the stars, my star,
Would that I were the heavens and thence on thee
Could gaze forth out of a thousand eyes.

Conversely we may exclaim that art gives to her forms the dilation of a thousand-eyed Argus, through which the inward life of Spirit at every point breaks into view. And not merely is it the bodily form, the expression of countenance, the attitude and demeanour which thus avails; the same appearance is everywhere visible in actions and events, speech and voice-modulation, in short, under every condition of life through which it passes, and under which it is possible for soul to make itself recognized in its freedom and ideal infinity.

(*a*) And, in close connection with this inquiry into the interpenetration through all parts of the animating soul, we may justly ask ourselves, what precisely we understand under this conception of a soul which is throughout visible: or to restrict attention to definite limits we may inquire what are the specific characteristics of the soul whereof art reveals to us the truest manifestation. For in ordinary parlance one refers to the animating principle[271] peculiar to metals, stones, wild animals, to say nothing of that belonging to every kind of human character and its expressions. To natural objects, however, such as stones and plants, the expression "soul" in the complete acceptation of the term above mentioned is not strictly applicable. Such soul as purely natural objects possess is entirely finite, transitory, and rather a specific nature than a soul. The determinate individuality of such

existences is consequently completely exposed in their finite existence; and, inasmuch as all that is present there is a positive limit of restriction, such appearance as there may be of a further claim to independence and freedom is only an appearance; ideal characteristics which may indeed be imported into them from without by means of art, but are not in the nature of the objects by themselves. In the same way the soul of sense-feeling, through which Nature manifests first the Life-principle only betrays a subjective individuality, which still remains shut within itself, unable to assert its reality in the further sense of a return upon itself in a consciousness which shall attach to it the form of infinity. Its content is, therefore, of a restricted nature, and its manifestation in part the unrest, power of motion, sexual impulse, anxiety or fear of the dependent life; and, in part, it is the mere expression of an *inwardness* capable of overcoming its finitude. The animating life of Spirit (mind) brings us first into contact with the free infinity capable within its own external and determinate existence of remaining constant to the inner principle of unity, and, in the act of expression, still reflected back upon its ideal substance. To Spirit consequently is it alone permitted to impress the hall-mark of its infinity and free self-recurrence on its external expression, even though by such expression it enters the realm of narrow boundaries. At the same time we may observe that Spirit, too, is only free and infinite in so far as it truly apprehends its universality, and deliberately posits for itself and accepts those ends which are adequate to its own notion. Consequently, in so far as it fails to grasp its own freedom it can only exist in a restricted content, a character that is stunted, a temperament at once crippled and superficial. In combination with nullity of this kind the manifestation of Spirit must perforce remain wholly formal. We shall only find here the abstract crust of self-conscious Spirit, whereof the content contradicts the infinity of its freedom. Only by virtue of a genuine and essentially substantive content

through which the restricted and mutable particularity derives its essential self-subsistency — so that definite structure and intrinsic worth, determined limit and substantial content, are realized in one totality — is such existence thereby able, through the very mode of expression which confines it, to proclaim itself also in its universal substance of self-contained soul-life. It is, in short, the province of art to comprehend and enunciate determinate and rational existence in its *truth*, that is to say, in the form adequate to its substance, the truly explicit content. And, consequently, the truth of art cannot consist in a mere conformity such as that to which we restrict the so-called imitation of Nature; external form must express harmoniously an internal content which is in itself harmonious throughout, and consequently can express itself as such.

(*b*) Art then, by comparing what is otherwise stained and rent through the contingent elements of external existence with the harmony that is essential to its notional truth, rejects that in the world of appearance which it is unable to combine in such a unity, and for the first time through this *purification* reveals the Ideal. It is possible to regard such a result as the flattery of art, as we sometimes hear it said, for example, that portrait-painters flatter. But even the portrait-painter, a type of art in which the Ideal is less prominent than in many others, should at least flatter in this sense, that he is bound to treat with indifference all that is merely the external detail of form, texture, and colour, the mere adjuncts, that is to say, of physical life such as hairs, pores, scars, and other external accidents, in his undivided effort both to apprehend and deliver the subject selected in its universal character and permanent spiritual individuality. It is one thing to imitate a physiognomy in the general outlines of purely superficial repose apparent at any time; it is quite another to detect and delineate the particular features which reveal the fundamental soul-life or character of the sitter. As already remarked, the Ideal is only truly found when the external

presentment is in itself a vehicle of the soul. It is one of our latest fashions to attempt, by means of those so-called "living pictures," an intentional and gratifying imitation of famous masterpieces. In these we find a fair reproduction of general accessories, such as grouping and draping; but, instead of the spiritual expression of the figures, have only too often to put up with faces absolutely commonplace. Such a defect mars the entire reproduction. The Madonnas of Raphael, on the contrary, in every detail of their countenance — whether it be cheeks, eyes, nose, or mouth — exhibit with harmonious consistency one supreme type of sacred joy, the pious, modest love of a devoted mother. We may affirm, if we will, that all women are capable of such emotion; but, at any rate, not every formal shape of feminine countenance is capable of expressing the depth of the same so consummately.

(*c*) This reference, then, of all points of external existence to their spiritual significance, so that the external appearance unveils in adequate measure the spirit thereof, is just what constitutes the nature of the Ideal. It is, however, a "carrying back" into inwardness, in which we do not find the universal thus carried back to its extremest limit to the form of abstract *thought*, that is to say, but is rather suffered to rest halfway at the point in which we find the purely external and the purely inward meet together harmoniously. The Ideal is consequently the reality selected out of the mass of chance particulars, in so far as the inner core in this external totality thus raised in opposition to universality is itself manifested as *living individuality.*[272] For the individual subjectivity, which not only carries in itself a substantive content, but permits the same to appear in its own external appearance, stands in this central position, that in it all that is substantially the content is not suffered in its universal aspect to appear as an abstraction of itself, but still remains enclosed within the sphere of individuality, and consequently appears associated with a determinate

existence, which now for its part, freed from mere finitude and transitory condition, is gathered up in a free and harmonious expression of most intimate soul-life. Schiller, in his poem "The Ideal and Life," contrasts the reality and its pains and struggles with "the still shadowland of Beauty." Such a land of shadow is the Ideal. The *spirits* which rise up here have lost in death immediate existence, are released from the hunger of Nature, freed from the claims which fettered them in subjection to external forces and all the changes and confusions which are linked together with finite appearance. But however much the Ideal treads under foot the mere object of sense and natural form, it draws at the same time the very wealth of it to itself, for it is art that is able to assign the very limits to all that the external appearance required for its self-preservation within which the external thing may appear as the manifestation of spiritual freedom. For this reason it is the Ideal which alone among things envisaged to sense presents a free and self-contained content reposing on its own resources, in complete sensuous enjoyment and satisfaction with itself. The music of this rapture may be heard through every embodiment of the Ideal. However far the external form may be carried the soul of the Ideal is never wholly absorbed in it. And in truth such manifestation is only beautiful in so far as its beauty not merely permeates the whole, but is a subjective unity, by virtue of which the subject-matter of the Ideal must appear emergent from all the fracture of its former individual parts and their respective ends and energies, raised in the Ideal itself to a higher totality and self-subsistence.

(*α*) We may in this respect point to the blessed repose[273], this self-contentment in its own self-secure consummation, as the crown of the Ideal. The ideal form of art stands like some blissful god before us. For the blessed gods are ultimately above and beyond the grim earnest of actual necessity, anger, and interest in finite existence and purely finite ends; and this positive withdrawal involved in the negation of all isolated particularity

give them the characteristics of cheerfulness and repose. In this sense we may interpret that phrase of Schiller: "Life is earnest, Art is *cheerful.*" Pedants, no doubt, have often enough cracked a joke over it, inasmuch as poetry in general, and Schiller's in particular, is a serious matter; and in truth no ideal art is without such a quality; but for all that in this very earnestness the essential character of cheerfulness[274] remains. This force of individuality, this triumph of self-concentrated freedom, is that which we recognize in an exceptional degree in ancient works of art and the blithesome repose of their figures. And this is not merely the case when we face a satisfaction that involves no struggle, but even in an example where the subject is rent by some breach in the entire content of its existence. For when the heroes of tragedy are represented as subject to Fate we find that the demeanour they present, which may be summed up in the words, "It is so!" still remains a simple withdrawal into personality[275]. The subject thus depicted remains throughout true to himself. He surrenders that which is seized from him, but the aims he pursued are not simply taken away; he suffers them to lapse and consequently does not lose his initiative. The man who is the bondman of Destiny may lose his life, but not his freedom. This repose on the essential birthright of Spirit is that which is able to preserve and reveal the blithe atmosphere of repose in grief itself.

(β) In romantic art, it is true, the breach or dissonance of the subjective principle is carried further, inasmuch as in it the exposed contradictions are emphasized and their division can be preserved. Thus, to take an example, we find the art of painting, in its representation of the Passion, not unfrequently dallies round the expression of ribaldry visible in the hideous contortions and grimaces of tormenting common soldiers; and, in its attachment to such discordant emotions, especially when depicting what is criminal, shameless, or evil, permitting the glad serenity of the Ideal to pass away. Even when such disruption loses its force, we find frequently that

ugliness, or, at least, the absence of real beauty, is set up in its place. In another school of the earlier Flemish art of painting the downright directness and truth of the representation, no less than the inextinguishable confidence of the faith to which it testifies, tend to assert, in despite of itself, a reconciliation in the feelings of all who behold it[276]. But such an unyielding result falls[277] short of the entire cheerfulness and satisfaction appropriate to the Ideal. However, it is possible also in romantic art, albeit here the representation of suffering and grief penetrates the soul and its emotions more deeply than is the case with antique art, that the delineation may reveal to us a spiritual intimacy, a delight in resignation, a blessedness in pain, a rapture in sorrow, nay, even a voluptuous ecstasy in martyrdom[278]. Not only in painting but in the profoundly religious music of Italian composers, we find this ecstasy and illumination of grief abundantly expressed. We may, as a summary definition in romantic art, call it "the smile through tears." The tears have their origin in affliction, the smile in blithesome serenity, and consequently this smile through weeping indicates, as it were, the point of self-repose in the midst of pain and suffering. It is hardly necessary to add that the smile indicated here is no mere sentimental emotion, no mere vanity of the subject treated or dabbling with beauty[279] over painful effects and insignificant traits of subjective feeling; rather (on its artistic side) it must appear as the firm delineation and freedom of beauty in defiance of all pain, in the spirit of what was said of Ximenes in the romances of the Cid, "how beautiful she was in tears." In contrast to this emotional abandonment in men is either ugly and repellent, or actually ridiculous. Children, for example, break into tears at the slightest provocation, and we can only laugh at them. The tears, however, in the eyes of a man of earnest and self-contained character, under stress of deep feeling, betray a very different type of emotion. Laughter and tears can, however, very readily fall apart as unrelated, and are, as such, falsely

utilized as a vehicle of art in such abstraction; the laughter chorus in Weber's "Freischütz" may be cited as an example. Laughter, after all, is a kind of explosion, which it is impossible to exercise without restraint and preserve the Ideal. Another example of this laughter, which is nothing but laughter, occurs in a duet of Weber's "Oberon," throughout which we are in a continual state of anxiety for the prima donna's throat and lungs. How very differently the inextinguishable laughter of the gods affects us in Homer, a sound which breaks from the blessed repose of divinity, and rather expresses gladsome serenity than abstract and wanton abandonment. Just as little ought weeping, devoid of all restraint, to be introduced into the ideal work of art, of such a kind as that we may hear in all its comfortlessness in another part of the "Freischütz." And speaking generally, in music singing must take to itself the kind of joy and rapture which we catch from the lark in the open sky. Shrieking, whether of pain or delight, is not music at all. Even in the expression of suffering the sweet tones of the plaint must penetrate and clarify the sorrows, so that it continually may seem to us worth all the suffering to arrive at such sweetness of plaint in its expression. And this is the sweetness of melody, the singing of every kind of art.

(*γ*) Regarded in a certain relation to this fundamental axiom of art we may find some justification for the principle of irony in its modern sense; but it must not be overlooked that irony is frequently destitute of all real seriousness, and is particularly prone to expatiate over bad subject-matter; and, in another aspect of it, it is apt to run to seed in the mere yearning of emotion rather than actively participate in practical life, as is proved by the case of Novalis, one of the finer temperaments who have made this point of view their own, and for lack of definite interest, or through shrinking from the real world, are driven up and down, and cajoled into this sort of spiritual consumption. This is the kind of yearning which will not descend to mere practical business and production, because it is afraid of soiling itself with

the contact of finite things, although it already secretly feels the defects of such exclusion. No doubt we find in irony that absolute principle of negativity, in which the subject of consciousness becomes self-centred through the annihilation of definite relations and particulars; but in this case the act of annihilation of definite relations and particulars, as we have already pointed out when discussing the principle, is not, as in comedy, essentially in its right place, simply exposing its own want of substance, but is directed quite as often against everything else excellent in itself and of sterling worth. Whether we regard irony, then, as this art of universal destruction, or as the yearning of which we have spoken in contrast with the true Ideal, it betrays a secret lack of proportion and restraint which is detrimental to the artist. Substantive form is what the Ideal demands, which, owing to the fact that it is clothed in the form and figure of external things, is unquestionably qualified by particularity no less than limitation; but this limitation of its form is at the same time included in such a way that everything merely external in its appearance is annulled and abolished. Only through this negation of mere externality is the determinate form of the Ideal a real exposition of the substantive content which belongs to it in a mode of appearance susceptible to sense-perception and the imagination.

2. The plastic presentment of form, which is as much a constituent feature of the Ideal as it is of the essentially homogeneous character of its content, and the way these two aspects are fused together, render necessary an inquiry into the relation obtaining between the ideal representation of art and Nature. For this external aspect and its embodiment is closely associated with that which we generally call Nature. In this connection we once more come upon that old and ever-renewed and still unsettled dispute, whether the representation of art should follow the objects of Nature as they appear strictly to sense, or should rather ennoble and illumine them. The right of Nature, the rule of beauty, the Ideal and the truth of Nature — with

indefinite conceptions such as these arguments for and against may be bandied about for ever. A work of art, we are told, should unquestionably be natural, but there is such a thing as a mean or ugly Nature, we must not of course imitate *that*; on the other hand — and so our disputants wrangle on and never come to a satisfactory conclusion.

In recent times the opposition between the Ideal and Nature has once more been emphasized and received an exceptional significance through the writings of Winckelmann. Winckelmann's enthusiasm, as already pointed out[280], was first awakened by his study of the antique and its ideal forms. This insight into the peculiar excellence of classic art he thoroughly mastered and only ceased from his labours after making all that he had learned through his study of such masterpieces famous throughout Europe. From this recognition, however, originated a kind of craze for ideal representation, which, despite all its belief in the discovery of beauty, was really a relapse into flatness, absence of vitality, and superficiality. It is this kind of emptiness more particularly in the art of painting, which Herr von Rumohr had before him in the polemical writings I have already noticed.

The theory of art has to solve this difficulty. As for its interest, on the practical side of art, we shall do well to pass it wholly by. We may formulate principles as we please for mediocrity and the talents that express it, the result is always the same. Whether our theory is a distorted one or unexceptionable all we shall get is something commonplace or weak. At the same time Art and more particularly painting has unquestionably received a stimulus other than that we have deprecated from this very quest of so-called Ideals; and, through the renewed interest thereby excited in old Italian and German painters, has at least made an effort to secure a profounder and more vital content in its work.

The world is quite as tired of hearing the praises of that equally exclusive Ideal in the opposite camp, namely, that of undiluted realism in art.

Theatregoers are, to take an example close at hand, heartily sick of the realistic type of domestic drama. The old story over and over again — disputes between husband and wife, sons and daughters, the source of our income, the inventory of our expenses, the servility of ministers and the intrigues of their lackeys and secretaries, down to the question of the last sixpence between the dame of the house and her kitchen-maid, or up to the last gossip of the daughters over their touching love-affairs in the parlour — such tales of woe most of us will prefer to take where, we may at least get them without adulteration — at home.

In this opposition between Ideal and Nature writers have been inclined to regard one type of art to the exclusion of others, with an especial predilection, however, for painting, whose subject-matter is the particularity of sense-perception. We will test our problem by putting the question to start with wholly in general terms, thus: "Is art to be prose or poetry?" Now what is truly poetical in art is just that which we have called the Ideal. If the question of difficulty in question is a mere matter of terminology we are quite prepared to call the Ideal something else. But, however called, the question remains what it is which constitutes poetry or prose in art. And although the adherence to what is in itself poetical in the determination of it by certain crafts may lead those arts into confusion, and, indeed, has already done so, it is contended that in so far as any subject has an express affinity with poetry, such has been also the subject of genuine pictorial treatment, genuine for the simple reason that such a content is unquestionably of a true poetical nature.

Well, let us examine a concrete case. The present exhibition of art (1818) contains several pictures, all of which are of one school, the so-called Düsseldorf. Every one of these have borrowed subjects from poetry, and indeed from the emotional side of poetry peculiarly adapted to pictorial representation. The more often and carefully we examine these pictures, the

more complete will be our impression of their excessive sweetness and insipidity[281].

In the foregoing contradiction there are present the following general characteristics[282]:

(*a*) First, there is the formal ideality of the work of art, that is to say, the element of poetry in its general signification, which is, as the term implies, something composed and brought together by man, which he has taken into his imagination[283] and then actively worked into the artistic composition.

(*α*) The nature of the content of such a translation may however, be a matter of indifference or, apart from the artistic representation we thus obtain of common life, may only interest us indirectly for the moment. In this way the Dutch school of painting, for example, has recreated, as it were, by means of human workmanship, the evanescent everyday appearances of natural objects in countless new artistic effects. Velvet, armour, light, horses, work-folk, old cronies, peasants puffing their smoke from old pipe stumps, the glitter of wine in transparent tumblers, rustics in soiled jackets playing with cards as ancient — such and a hundred other subjects like them which trouble us little enough in everyday life, for the best of reasons, that although we too may have our game at cards, our drink, and our gossip we are really occupied with quite another class of interests — all this medley of objects is brought before us in their pictures. Now the claim of art in the representation of such things is precisely this external show, or reappearance of them as a product of spiritual activity, which has transmuted that which was purely external and sensuously material into a new medium supplied by mind. For instead of wool or silk that are tangible, instead of actual hair, glasses, flesh, and metals, all we see now is colour; instead of the three dimensions which are essential to external Nature, we have only superficies; and yet, despite all our losses, we have a representation identical with that of reality.

(*β*) In opposition to the immediate and prosaic reality of objects, then, this *show* of things which is effected by the mind is the wonder of ideality, a jest, if anyone cares to put it so, and an irony directed against purely external existence. Only contrast with it the preparations Nature or man has to make in ordinary life, the countless instruments of every kind they have to employ to effect the same result. What opposition the material of such objects — take a metal for example — may offer to any active effect upon it. The world of ideas, on the contrary, out of which art creates its products, is a malleable and simple element, which readily converts everything, which either Nature or man in his purely natural existence is forced to leave bluntly just as they are, to the uses which are appropriate to it. In the same way the objects of ordinary apprehension and man as we meet him in everyday life are of no incommensurable wealth, but subject to limitations — precious stones, plants, animals, etc., by themselves are of a certain positive and particular character. But man in his creative capacity is an entire world of content, which he has filched from Nature, and piled together in the comprehensive treasure-house of his world of images, and which he is now free to give forth again simply and without the restraint of external conditions and the detailed processes of actual phenomena. In this idealization art stands midway between the purely objective and restricted existence and the entirely subjective world of idea. It gives indeed objects, but they are supplied from the life of mind; it offers them for uses other than those which belong to them; it concentrates their entire interest in the abstract form of the ideal show which it therewith manifests to aesthetic contemplation, and to that alone.

(*γ*) Art consequently, through the ideality above explained, *exalts* objects otherwise unimportant, determining them, despite their ordinary character, in a fixed relation to her own medium and essential aim, and by so doing secures from us a sympathy in subject-matter which otherwise would not

have enlisted our serious attention. We find the same transformation in the relation of art to Time. Its position is here too frankly ideal. That which in Nature rapidly passes by in art is secured with permanence; the flash of a smile, the sudden curve of roguish merriment on the lips, a glance, a gleam of sunshine, together with all those evanescent traits of human life, events and accidents which come and are gone, and are as quickly lost to memory. There is nothing which she cannot wrest from momentary existence, and in this respect even becomes the vanquisher of Nature herself.

In this formal ideality of art, however, it is not the content itself which makes the pre-eminent claim upon us, but the satisfaction we derive from the act of artistic reproduction. The representation must certainly strike us as natural, but it is not the reality of Nature that we require; it is rather that of the process of reproduction, this very deposition, in fact, of material conditions which is the poetical and ideal element of the work in the formal sense above indicated[284]. We delight in a manifestation, which appears to us a product of Nature, and which is nevertheless a product of mind without the means at Nature's disposition. The objects charm us not so much by virtue of their approach to Nature, but rather because the *artist* has been able to effect that approach.

(*b*) A further and still profounder reason for our interest in artistic products consists in this, that the content is not brought before us in those forms in which it is found in immediate existence, but, being itself minted by the mind, is capable of considerable extension and modification within such forms. All that exists in Nature is particular, and, indeed, limited in every direction by such particularity. The creative faculty[285], however, contains an intrinsic determination of universal import. And all that it produces possesses forthwith a character of universality distinct from the particularity of Nature. The creative faculty thereby secures this advantage;

that being of a wider range it is more qualified to grasp ideal significance, and to insist on that explicitly in all that it shows us.

It is quite true that a work of art is not entirely the imaginative concept in its universal aspect, but rather the determinate form of its envisagement. It is for all that bound, emanating as it does from the creative medium and operations of mind, and despite the living resemblance to real things we may find upon it, to permeate the whole with this universal quality. And in this we have that higher ideality of the poetical product as contrasted with the purely formal ideality of the art of production. From this point of view it is the task of a work of art to grasp the object in its universal relations, and in the envisagement it presents to let fall everything which stands in a wholly external or indifferent relation to the content. An artist for this reason will refuse to accept all forms and means of expression offered him by the external world, on the mere ground that he finds them there. His main effort will be, if at least his aim be a real poetical creation, to secure that which will appropriately work in with his own imaginative conception; and, if he looks to Nature for assistance in supplying him with details, or, generally, as material to translate into his work, he will utilize such, not because he finds them so in Nature, but because they fall in their *right* place as a part of his composition and are rightly made for him. This "right" of the artist is a higher one than the mere right of immediate *fact.*

In his representation of the human form, for instance, an artist will not attempt such imitation as we find attempted by those restorers of ancient pictures, who reproduce old cracks, which through the swelling of either paint or varnish have involved all the older parts of the picture in a kind of arabesque, even on the portions restored. The portrait-painter will rather permit the tracery of the flesh, and *a fortiori* such incidents as freckles, pustules, warts, and so forth, to disappear entirely. In this respect the painter Denner, so famous for his close realization of Nature, is by no means an

ideal master. For the same reason indications of muscles and veins may be given, but their distinction and relief should be far slighter than that we observe in Nature. In all such impressions little or nothing of spirit is manifested, and the expression of spirit is what is essential in the human form[286]. I cannot think it therefore wholly a disadvantage that we moderns have less to do with the nude in sculpture than the ancients. On the other hand the general style of our dress in comparison with the ideal drapery of classical times is less artistic and more commonplace. The object in both cases is to cover the form. The drapery, however, we find in the antique is, taken by itself, a more or less formal smooth surface only so far determinate in its adjustment to the frame by its attachment to the shoulder. In other respects the garment remains entirely formal[287], hanging down simply and freely by virtue of its own immanent weight, or only determined through the position of the body and the pose and motion of the limbs. In the determination thus implied we find the external shape entirely reflecting the mutable expression of the spirit which animates the body. The particular form of the garment, the folds of it, the motion of it either up or down is clothed in the shape dictated direct from the inward impulse, and as each may momentarily appear appropriate to the particular pose or movement — and it is this form of determination which constitutes the ideality of such drapery. In the clothing we have adopted nowadays, on the contrary, the entire material is, from the first, cut out and worked up stiffly into the forms of particular limbs, so that anything approaching spontaneity in its rise and fall is impossible. Even the character of the folds is determined by previous models, and generally both cut and fall are worked out wholly by the technical rules and craftsmanship of the tailor. It is true, of course, that the configuration of the limbs determines generally the form of such clothing; but in this arrangement of the bodily form we merely have either a perverse imitation, or an enveloping of human limbs according to the convention of

fashion and the accidental taste of the times. The cut of our cloth once made is irrevocably made, and neither the position of the body nor the motion of the limbs can appreciably affect it. We may move our arms and legs about as much as we please, the sleeves of our jackets and our trousers remain unalterable. Folds or creases may perhaps appear in them, but even then only on the lines of the original cutting out, as we see them, for example, on the statue of Scharnhorst. Our modern way of clothing is consequently, as an external cover, not sufficiently differentiated from the inner life to appear on its reverse side as the formal expression of that life; instead of this we have a false imitation of the human form stereotyped in the preordained and unalterable cut of our tailor.

A criticism similar to that we have directed to the representation by art of the human form and its exterior clothing might be applied to a whole multitude of things which make up the external show of life, or minister to its wants, such as eating, drinking, and sleeping — things necessary enough in themselves and useful to all men, which, however much in their manifold variety, as constituent features of the physical life of mankind, they may blend with those activities more directly related to its spirit, do not themselves form part of such activities, or stand in essential relation either to their determinations or their interests, and thereby contribute to what is the truly ideal or universal element in the content of human life. Physical aspects of life such as these may no doubt receive poetical treatment in art; and it is generally admitted that the descriptions of a poet such as Homer in this direction adhere very closely to Nature. Yet we find that even Homer, despite all his *ἐνέέργεια*, all the vividness of his presentment, is forced to limit his descriptions to general observations; no one expects to find in him an entirely accurate picture of the facts in all their detail as they actually would occur in life. He may give us, no doubt, in his delineation of the bodily presence of Achilles, the lofty brow, the prominent nose, the long

and stalwart legs, but he is not likely to include in the picture every detail of the veritable existence of limbs point for point, and the relation in which they stand to one another in colour, size, and so forth, in other words to offer us Nature's reality instead of an artist's portrait. And the reason is obvious inasmuch as in the art of poetry the type of expression is always the universal concept of the imagination as distinguished from the bare particularity of Nature. Instead of the fact the poet always gives us the denominant, the word, in which the particular thing is universalized; for the word is a product of mental conception, and as such already carries in itself the nature of a universal. One is entitled to say, of course, that it is *natural* in the formation of concepts and speech to employ a nomenclature, the word, as such an infinite[288] abridgment of the existence we find in Nature; but if we do so the Nature to which we refer it would not merely be opposed to the natural existence with which we compare it, but would be just that which cancels it. We are therefore confronted with the question in what sense we use the word Nature when we contrast it with the characteristic of poetry. The mere undefined use of the word Nature by itself tells us nothing at all. What poetry should always give us is the energetic, the essential, the truly characteristic; and this fundamental expressiveness is precisely the Ideal and not the merely immediate, to enumerate all the details of which in the narration of an event or the portrayal of a scene will render either of these simply dull, spiritless, tedious, and intolerable. In the manifestation of this universality, however, one type of art will reveal more clearly its ideal characteristics; another will rather emphasize, by a restricted use of material form, the infinite detail of external reality. Sculpture, for example, is in its presentments more abstract than painting; in poetry the epic type, in its realization of the external appearance of life itself, will not be so complete as a dramatic poem should be. On the other hand it will surpass the latter in its portrayal of the fulness of its imaginative vision, the epic poet being

most indebted to concrete pictures his imagination borrows from past history. In contrast with him the dramatist is mainly restricted to the motives of an action, the attitude of the will to it, the psychological problem in short.

(*c*) It is, then, *Mind* (Spirit), which gives external realization in a particular form to the inward world of content which is of essential interest to it; and it is in close relation to this fact that we should consider the question, what precise significance we are to infer from the opposition above discussed between the Ideal and *naturalness.* And first we must observe that from such a point of view the word *natural* is not employed in the most genuine signification of the term. As a description of the external form imposed upon facts by mind it obviously is neither the immediate naturality we find in animal life, nor that presented in Nature's landscape. Rather its very form of determination, in so far, that is to say, as we see the mind here giving to itself an embodiment, will show us that it is an expression of mind, an expression moreover suffused with ideality. For this taking up into the mind, this plastic recreation of form on the part of mind is nothing less than idealization. It is sometimes remarked of the countenances of dead people that they take on themselves once more the lineaments of childhood. The obdurate expression of passion, custom and strife, the characteristic seal of their life of strenuous action, passes off, and the indeterminacy of the features of a child's face reappears. In life, however, all traits whatsoever, the entire presentment in fact, receive their characteristic expression from the world of soul; and in much the same way the different races and classes of mankind reflect the distinguishing features of their spiritual tendencies and activities in their external manifestation. In all such organizations that which is outward is visibly permeated with mind; and, by virtue of its energy, already confronts *mere* Nature as an idealized creation. Only a clear perception of this truth will enable us to sift this

significant question of an opposition between Nature and the Ideal to the bottom. If we do not possess this we shall find ourselves maintaining that the forms in which Spirit is visualized as a part of Nature have already lost in that real appearance, which is independent of art's imitative action, such an intrinsic completeness, beauty, and excellence, that it is quite impossible that there can be another and more exalted type of beauty, which presents itself as the Ideal in contradistinction to this immediate reality, and this all the more for the reason that art is unable entirely to attain even to that which is present in Nature herself. Or, if our thoughts lean to the opposite extreme, we shall look to art to supply us independently, in opposition to Nature's reality, with more ideal modes of representation. The polemics of Herr von Rumohr, which we have already criticized, are well worthy of attention in this connection. This writer, at any rate, whatever others may say who have the word Ideal so frequently on their lips in depreciation of the vulgarity of Nature, refers to the Idea and the Ideal in phrases of respect and contempt with absolute impartiality.
